EVENTS OF PHARMACY IN 1933

(See Historian's Report November JOURNAL, page 1190)

The outstanding event of American Pharmacy is the completion of the Pharmacy building in Washington—the American Institute of Pharmacy— 'dedicated to those who have contributed their knowledge and endeavor to the preservation of public health and to the further advancement of science in pharmacy ' The site is beautiful—the building faces the Lincoln Memorial, the historic river and Memorial Bridge may be seen from the building, also, the Washington Monument and part of the dome of the Capitol

The Leadbeater pharmacy, in Alexandria, was purchased for the AMERICAN PHARMACEUTICAL ASSOCIATION an association in Alexandria hopes to purchase the building and maintain the old pharmacy as a museum if this Association is successful in raising sufficient funds, the fixtures, other articles and records will remain in Alexandria, otherwise these will be placed in the headquarters building

Pharmacy's exhibit at the Century of Progress" interested the public, and the visitors obtained a better understanding of the service of pharmacy, many pharmacists were registered and quite a number of them were from foreign countries

A symposium on Practicing Professional Pharmacy" was an outstanding feature of the Madison meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION

As all other activities, the drug industry is subject to codes applying to its several divisions The code applicable to Retail Drug Establishments and to all Retailers dealing in drugs and allied products will be found on page 1071 of the October JOURNAL A comment applying to pharmacists has been made by the Administration as follows

'The terms registered pharmacist,' assistant pharmacist' and 'apprentice pharmacist,' as used herein (Code) shall have the meaning given to them under the laws of the respective states of the United States and of Alaska

'A worker to be classified in this group must comply with the state law requirements for his position The separate classification of pharmacists and professional persons is not intended to reflect in any way upon the recognized standing of pharmacists "

Legislation in Congress is under discussion which seeks to amend the Food and Drugs Act or create a new law The AMERICAN PHARMACEUTICAL ASSOCIATION adopted the following resolution at its Madison meeting

"*Resolved*, that the AMERICAN PHARMACEUTICAL ASSOCIATION records its approval of the proposed changes in the Federal Food and Drug Law in so far as they provide for more effective protection of the public health, and be it further

'*Resolved* that in the interest of a sound public policy the delegation of arbitrary discretionary powers in connection with the enforcement of Food and Drug legislation be disapproved "

The reader is referred to the address of W G Campbell, Chief of the Food and Drug Administration in the October JOURNAL, page 1012, an editorial in the December JOURNAL , report on action by the Drug Trade Conference in the same number, page 1307

The ' Pharmaceutical Syllabus ' has been revised, revisions of the "United States Pharmacopœia" and of the "National Formulary" are progressing

The most important event in British pharmacy is the passing of the Pharmacy and Poisons Act Every person registered as a pharmacist, shall by virtue of being so registered, be a member of the Pharmaceutical Society of Great Britain

Pharmacy Week was held during the week of October 9th

L D HAVENHILL

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

Vol XXIII JANUARY, 1934 No 1

THE PRESIDENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

L D Havenhill, the thirty-third president of the American Association of olleges of Pharmacy, was born in the town of Big Grove, Kendall County, Illiois, April 5, 1870 His early education was obtained in the Kendall County rural hools and completed in the West Aurora, Illinois high school, from which he aduated in 1887

The years 1890–1891 were spent in gaining practical experience in an Iowa drug store He entered the University of Michigan School of Pharmacy in the fall of 1891 and a year and a half later passed the Michigan State Board of Pharmacy examination for registered pharmacist, but following graduation he accepted the invitation of Prof A B Stevens to remain as his assistant in pharmacy for the following year and to complete the work for the degree of Master of Pharmacy This work was completed in June 1894, in time to accept a position of assistant chemist for a year in Honolulu with Dr A B Lyons While there he made some of the first chemical analyses of the rich sugar cane lands of the island of Oahu Upon the completion of this work with Dr Lyons he spent several months in the laboratory of the government chemist, Dr Walter Maxwell Upon his return to the states he was employed for a time in a pharmacy in Aurora, Ill , but later became assistant chemist for the Chicago and Aurora Smelting and Refining Company

In the fall of 1899 he was appointed assistant professor of pharmacy at the University of Kansas, a position which he held until 1907 when he was granted a leave of absence to take a position as food and drug inspection chemist with the U S Department of Agriculture under Dr H W Wiley and Dr L F Kebler After a year at the appraiser's stores in New York City, he returned to the University of Kansas School of Pharmacy as professor of pharmacy and pharmaceutical chemistry Following the death of Dean L E Sayre, in 1925, he succeeded to the deanship

Dean Havenhill is a member of the Kansas Pharmaceutical Association

and is its librarian He is a member of the AMERICAN PHARMACEUTICAL ASSOCIATION (1890), the American Chemical Society and the Kansas Academy of Science, and has held important offices in each He is a member of the honorary scientifi society of Sigma Xi and the Gesellschaft fur Geschichte der Pharmazie He is a member of the Committee on Recipe Book and is serving his second decennial term on the Revision Committee of the U S Pharmacopœia

He is director of drug analysis for the Kansas State Board of Health and member of the referee committee on livestock remedies for the Kansas State Board of Agriculture He has contributed articles to various pharmaceutical journals and is the author of *Pharmaceutical Arithmetic*, 1912, *State Boards of Pharmacy Questions*, 1917, and co-author (with L E Sayre) of *Essentials of Pharmacy*, 1918

A WORD OF APPRECIATION

THE office of the AMERICAN PHARMACEUTICAL ASSOCIATION and of the JOURNAL has been in Baltimore for the past eight years During this time the writer has received many courtesies and made quite a number of friendships which he hopes will continue for many years Baltimore is known for its hospitalities and has a good pharmaceutical history, its pharmacists represent not only the ideals of pharmacy, but the members of the profession give expression to their views important questions and seek to advance pharmacy and its service

It is hoped that the foregoing words are proper in this place, certainly, they are expressive of the writer's appreciation

OFFICERS-ELECT FOR 1934–1935

The Board of Canvassers of the AMERICAN PHARMACEUTICAL ASSOCIATION composed of W F Rudd, Chairman, W G Crockett and A L I Winne, all of Richmond, Va , has announced as the result of the mail ballot for officers of the ASSOCIATION, the election of the following

President, Robert P Fischelis, Trenton, N J
First Vice-President, George D Beal, Pittsburgh, Pa
Second Vice-President, Oscar Rennebohm, Madison, Wis
Members of the Council (for three years), H A B Dunning, Baltimore, Md , S L Hilton, Washington, D C , W Bruce Philip, Washington, D C

These officers will be installed at the next annual meeting of the ASSOCIATION which will be held in Washington, D C , the time to be announced later

Whether the alleged victim be the small industry or the small enterprise the effect of the national recovery program on its functioning should be studied with most assiduous fact-finding and fault finding The recovery undertaking cannot be expected to remove all the competitive disadvantages of small size, but it certainly must not be allowed to aggravate them '—*Paint Oil and Drug Reporter*

EDITORIAL

F G EBERLE, EDITOR 2215 Constitution Ave , WASHINGTON, D C

WE GREET 1934 WITH HIGHER HOPES

IN ENTERING a new year it is frequently the indulgence of the introspective to recall thoughts of past successes or linger on remembrances of evil days and bemoan prospects, based on deductions made by them The value of both depends on whether the aim is to "carry on "

The year enrolled on the records of time has been an eventful one, unexpectedly, hidden or unknown conditions were brought to light and the great majority met with difficulties, the Government, with natural wealth, economic productiveness, potentialities of material prosperity, had to deal with problems that obtain in countries we consider less fortunate than our own It was deemed necessary to apply methods to which the people of the United States were not accustomed, a study of them may bring the individual to conclusions, but in order to solve the problems it is necessary that all citizens do their part Viewing the conditions of the earlier months of the past year and comparing these with the later—there is evidence of progress True it is, that we have to submit to rules and regulations, methods and what not, many of which we do not understand, some prefer to —"most of us do not comprehend " The inconveniences are many and the average citizen is disturbed by expenditures that seem beyond the possibilities of ever being adjusted, but, despite all of this, the inextinguishable impulse of our people is to believe that this year will be better than the last, somehow, the memories of the mistakes and disappointments of 1933 will be shaken off and we greet 1934 with higher hopes

---

FOOD AND DRUG LEGISLATION IN CONGRESS

SENATOR ROYAL S COPELAND has introduced a revised food and drugs bill numbered S 2000, based on the former bill, S 1944 Many changes and additions have been made, among the latter, the creation of a Committee on Public Health and a Committee on Foods, each to consist of five persons appointed by the President "with a view to their distinguished scientific attainment and interest in public health" to assist the Secretary of Agriculture in preparing and amending regulations which must be approved by the majority of the appropriate committee Provisions have also been included for hearings on regulations and for court review by injunction proceedings, of promulgated regulations

Relative to labeling, the Copeland revision says "if its labeling is false or misleading in any particular, provided that no drug shall be deemed to be misbranded because of any representation concerning any effect of such drug if that representation is supported by substantial medical opinion or by demonstrable scientific facts " The "not a cure" provision in the definition of misbranded drugs has been entirely rewritten to require that the label show that the drug is a palliative and how and to what extent

Congressman Loring M Black, of New York, has introduced the bill of the National Drug Trade Conference to amend the present food and drugs act

The purposes of the Conference in preparing the amendment were set forth by Representative Black, They are, in part, as follows

1 Enlarge the definitions of the act so as to include devices and cosmetics

2 Extend its provisions to include advertising

3 Provide that notices of hearing shall be furnished to the manufacturer of the product, if known, and if unknown to the party who caused the article to be introduced in interstate commerce, instead of to the party from whom the sample was obtained, as provided in the present law

4 The provision relating to the United States Pharmacopœia and National Formulary is amended to provide that the article shall not be deemed to be adulterated if the finished product complies with the pharmacopœial or National Formulary standards, without regard to the manner in which such product may be manufactured

5 Cosmetics are deemed to be adulterated if they contain poisonous or deleterious ingredients in such quantities as are likely to be imminently dangerous to the user under prescribed conditions This in lieu of provisions of Senate 1944, which provide in effect that the cosmetic shall be adulterated in case there is any remote danger of injury to persons with an idiosyncrasy

6 The term, 'package' or ' original unbroken package,' is defined as that intended for delivery to the ultimate consumer—that is the retail package The Supreme Court of the United States (McDermott *vs* Wisconsin, 228 U S 115), has in effect indicated that under the present law such is the defined package of commerce

7 Label" and advertising" in the amendment proposed by the National Drug Trade Conference are in effect the same as in Senate 1944

THE PHARMACY AND POISONS ACT (GREAT BRITAIN)

THE British Pharmacy and Poisons Act became effective December 31st, under this Act every one (in Great Britain) at present registered as a "pharmaceutical chemist" or "chemist and druggist becomes a member of the British Pharmaceutical Society without any action having to be taken by him The annual registration fee is £1, 11s , 6d which includes a copy of *The Pharmaceutical Journal,* a provision, registering pharmacies, will come into force

We quote from an editorial comment in *The Pharmaceutical Journal* on the effects of the Act "though the Act does not contain all that could be desired, even though it falls short of the expectations of the mildly optimistic, it is a gigantic step in the right direction If it did no more than to compel every person engaged in the business of a chemist and druggist to bear his share of the cost of administration it would have been worth while The essential constitution of the Society (British Pharmaceutical) remains unaltered The Act strengthens not weakens the Society Pharmacy remains a self-governing calling, controlled by a Council elected on a democratic basis, fixing its own qualifications, setting its own standards of education, regulating its own method and right of entry The presence of three lay members—(the Privy Council may appoint three members of the Council and these need not, necessarily, be members of the Society)—will add to, rather than detract from, the powers of the Council "

Inspectors are provided for, anyone who is registered under the Act may be deprived of his certificate for misconduct

---

SCIENTIFIC SECTION

OXIDATION AND ANTIOXIDANTS *

BY A LEE CALDWELL AND FRANCIS E BIBBINS

One of the principal requisites of life, an indispensable, elemental necessity, is oxygen We live by oxygen's favor only to spend our time and effort in an attempt to abate or prevent the damage done by this same element Our food spoils and our property wastes away, in many instances due to the continual reaction which we know as oxidation The first antioxidants were no doubt completely physical in their prevention of oxidation, such as pickling solutions, liquids or resins which protected some substance from contact with air Our forefathers knew that their implements must be oil treated, lacquered or painted to preserve them, and we find that lacquer was used in China as a protective for buildings in the second century B C, and a definite record of lacquer manufacture in Japan dates about A D 587 The lacquer used was an oxidizable substance extracted from a tree, *Rhus vernicifera*, and first oxidized to a yellow substance and then to a black

An antioxidant is a substance which inhibits, prevents or stops the oxidation of some other substance or substances This action is thought to occur in several ways

By Inhibition—Where the oxidation reaction is prevented by a substance which naturally repels the absorption of oxygen or takes up the oxygen which would combine with the substance being protected

By Catalytic or Anticatalytic Action—In which the antioxidant is regarded as a negative catalyst or a catalyst operating against change in the substance to which it is added This catalytic action operates to cause a reaction to take some form other than the normal reaction with the principal substance involved

By Chain Reactions—In which the oxidizing reaction is viewed as one that starts and while going on gives off energy which in turn starts another reaction with the same results The antioxidants operate to break up these subsequent reactions and stop this recurring chain

These three conceptions while given here with titles to set them apart are not by any means entirely or distinctly different There is some variation in viewpoint but each of them involves more or less a very kindred action There are other theories which bear a connecting link between those just mentioned but are not sufficiently distinctive to continue to enumerate them

Moureu and Dufraisse (1) have done quite extensive work on the study of auto-oxidation with the viewpoint that every reaction is a catalytic one, and there seems to be no legitimate reason to doubt that all auto-oxygenic or antioxygenic actions can be viewed from this standpoint Whatever action takes place and by whatever means, it is easily resolved into one of catalysis That every antioxidant is one that can be oxidized is seemingly very safe ground, especially when one

* Scientific Section, A PH A, Madison meeting, 1933

considers that oxygen is oxidizable to ozone and acts as an inhibitor in the reaction between hydrogen and chlorine

About twenty or twenty-five years ago considerable interest was aroused among chemists over oxydase, an enzymatic ferment, which was held as the principal causatory agent of oxidation in all products in which it was existent Keegan (2) relates the observations of Lindet in 1893 regarding the oxidation of apple juice It was found that the juice from boiled apples did not discolor in the air while the juice from fresh apples, cut and washed thoroughly with boiling water, did discolor A conclusion was advanced that perhaps the vegetable tannin precipitated the oxydases In the light of what we now know it seems more probable, however, that in boiling, a chemical reaction was responsible for some change in a natural constituent either destroying a pro-oxidant or forming an antioxidant Such a conclusion has been reached by Overholser and Cruess (3) in their study of the browning of apples They concluded that a peroxydase and an organic peroxide were responsible, and definitely detected the peroxide in fresh apple juice and could find no evidence of it in the boiled juice

Lubimenko (4) observed, or detected, the formation of an antioxydase as a natural process during the ripening of the tomato

It is well known that the heating or boiling of oils increases their susceptibility to oxidation Especially is this practiced in the preparation of linseed oil, and in addition to boiling, traces of metals or metallic compounds have been added Pholin (5) classified the activity of fifteen metals according to their activity as follows *Group 1*—Cobalt, manganese, chromium, nickel, iron, platinum, palladium *Group 2*—Lead, calcium, barium *Group 3*—Bismuth, mercury, uranium, cobalt, zinc Observation of the increasing weight of a small sample is said to indicate the progress of the reaction

Powick (6), in his study of the rancidity of fats, has given detailed consideration to the substances found in rancid fats with the idea of determining the agent responsible for the odor as well as seeking the agent responsible for the reaction in the Kreis test Heptylic aldehyde is credited with the odor, and by spectroscopic methods the product of the reaction between acrolein and hydrogen peroxide has been found identical with that responsible for the color developed in the Kreis test, and identified as epihydrin aldehyde

The Kreis test has had more or less discussion as to its reliability, and it may be said in regard to the work done in connection with this paper that the Kreis test was not depended upon except in a rough way Powick found it unreliable in some cases and similar results have been obtained by many others The Kreis test is performed by taking 5 cc of the oil or fat to be examined, adding 5 cc of concentrated hydrochloric acid, shaking thoroughly and then adding 5 cc of 0 1% solution of phloroglucin in ether A red coloration in the acid layer indicates rancidity Holm and Greenbank (7) feel that the Kreis test is outranked by no other and are certain of its dependability They do, however, state that the test does not indicate the degree of rancidity Jones (8) regards the Kreis test as the best specific indicator of rancidity But it is generally agreed that the degree of color is not proportionate to the rancidity, and that is the difficulty that has been encountered in the following experiments The color developed is a very light pink in many cases and an indefinite pinkish brown in others, making it confusing in many instances

Richardson (9) reports that the test is not recommended for adoption by the American Oil Chemists Society The most satisfactory results have been obtained in these experiments with a type of mercury manometer and a test in which a potassium iodide solution was used Hyman and Wagner (10) used an alcoholic solution of potassium iodide and titrated the liberated iodine, after three minutes' standing in the dark, with 0 01 normal sodium thiosulphate, starch indicator These authors state that an attempted manometric method gave erratic results and for this reason they abandoned it in favor of the chemical test

Greenbank and Holm (11) concluded that methylene blue gave a good indication of the resistance offered by a fat to oxidation We have found in this laboratory that the reduction of methylene blue in fats is very unreliable as to the powers possessed by an added antioxidant and if reliance were placed on this method, monoethanolamine would be quickly eliminated as a desirable antioxidant, however we are using it with great satisfaction in an aqueous solution of an organic mercurial

In many instances refined oils and fats become rancid much more readily than the crude product and it has apparently been correctly assumed that refining removes some non-sterol portion which is a natural antioxidant

TESTS USED IN DETECTION AND DETERMINATION OF OXIDATION

The Methylene Blue Test —Twenty cc of fat are mixed with 1 or 2 cc of a 0 025% solution of methylene blue in absolute alcohol The use of alcohol other than absolute will introduce the factor of water in the experiment

The Guaiac Hemoglobin Test —To a 10 Gm sample add 4 or 5 drops of a one or two per cent solution of hemoglobin, 10 drops tincture guaiac and 10 cc of distilled water Allow to stand a few minutes when a blue color will be produced if oxygen has been absorbed

The Kreis Test —Has been given above

Alcoholic Potassium Iodide Test —To 5 Gm potassium iodide add 10 cc distilled water and ethyl alcohol 95% to make 100 cc To a 5-cc sample of the oil or melted fat add 5 cc of this alcoholic solution and shake thoroughly, allow to stand about fifteen minutes and the alcoholic layer will appear as the supernatant liquid It is essential that the samples for comparison be previously measured out and the addition of the potassium iodide solution be then made as near simultaneously as possible *Each sample is shaken the same length of time* The amount of color furnished by the liberated iodine will serve as an index to the amount of oxygen absorbed and the samples can be arranged accordingly

Work in this laboratory was begun on cod liver oil, this being a very good example of a medicinal oil upon which feeding tests can be readily made, and also representative of a drying oil which will show resinous deposits or films when oxidized From the latter standpoint work done upon linseed oil is applicable and considerable work has been done upon linseed oil and antioxidants Mattill (12) has reported results with numerous chemicals both on lard and cod liver oil

The first experiments undertaken were in connection with the antioxygenic activity of hydroxy-methyl-anethol, CH_3 OH CH_3CH CH C_6H_4O CH_3 Anethol is very rapidly oxidized even upon exposure to light, and since it is held more or less generally that the hydroxy compounds are a desirable class as antioxygens it appeared that this chemical might have satisfactory qualities

Three 25-Gm samples of cod liver oil were taken, plain oil, one containing 0 1% hydroxy-methyl-anethol (which for brevity will be designated as H M A) and oil containing 0 2% H M A Oxygen was slowly bubbled through the samples

and they were exposed to the light of a 100-watt lamp brought directly upon them These samples were in a cabinet and were kept at a temperature of 35° C The samples remained in this cabinet for a 24-hour period during which time 46-80 cc of oxygen passed through each sample Determinations were made for free fatty acids in an attempt to determine exactly the course of the reaction The results follow

Control	F F acids as % oleic	0 4022
Sample plain oil	F F acids as % oleic	0 4006
Oil with 0 1% H M A	F F acids as % oleic	0 4089
Oil with 0 2% H M A	F F acids as % oleic	0 4256

The results were too close together in the first three samples to make any conclusion whatever The sample containing 0 2% H M A did show that the induction of rancidity was definitely started

Taking a new sample of cod liver oil, four 150-Gm samples were taken, placed in a cabinet at 35° C and exposed to the light of a 100-watt lamp for 27 hours During this time oxygen was slowly bubbled through each sample until a total of 1600 cc had been brought into contact with each sample of oil Free fatty acid determinations were made (Col 1) and the samples were set aside at room temperature in the dark, at the end of six months the samples were checked for free fatty acids (Col 2)

The sample of plain oil was showing a film of oxidized oil on the surface, with a varnish-like deposit accumulating on the sides of the bottle at the surface The control sample was in the same condition with approximately thirty per cent less oxidized deposit The samples containing H M A were free from any film or resinous deposit The sample containing water was also free from any oxidized film Both the control and the plain oil sample had a decidedly rancid odor while the other samples were comparatively free from this odor, the H M A samples being best

All of the samples were then kept in the dark, at room temperature, and at the end of two years, acidity determinations were again made (Col 3)

Experiment ' A "		1	2	3
Control	F F acids as % oleic	0 379	0 6508	5 506
Sample plain oil	F F acids as % oleic	0 418	0 8606	6 809
Oil with 0 1% H M A	F F acids as % oleic	0 427	0 6313	1 083
Oil with 0 2% H M A	F F acids as % oleic	0 456	0 6603	2 085
Oil with 1 0% water	F F acids as % oleic	0 407	0 5751	1 040

The natural color was retained best by the sample to which water was added and was nearly as good in the sample containing 0 1% H M A The sample containing 0 2% H M A was slightly darkened, and the control and the plain oil sample were brown in color The rancid odor was much greater in the control and plain oil sample

Simultaneously with starting "A," 150-Gm samples of the same oil were exposed to heat only, the temperature being 50° to 52° C The control sample being the same as above

Experiment B '		End 1 Week	End 1 Month	End 6 Months
Sample plain oil	F F acids as % oleic	0 4234	0 5051	1 448
Oil with 0 1% H M A	F F acids as % oleic	0 4385	0 5320	1 131
Oil with 0 2% H M A	F F acids as % oleic	0 4365	0 5170	1 286
Oil with 1 0% water	F F acids as % oleic	0 4079	0 5603	1 486

It will be observed, in the determinations made at the end of twenty-seven hours and at the end of one week, that the induction of rancidity is more rapid with the addition of H M A and that the addition of water delayed this induction period The determinations at the end of one month, on the heated samples, show the effect of the added water and the lesser acidity of the sample containing 0 2% H M A The results are also shown for the end of a six months' period The sample of plain oil showed a thick resinous film on the surface and resinous deposits on the sides of the bottle The hydroxy-methyl-anethol samples were free from any film or deposit and the rancid odor was only about 25 per cent as great The sample containing water was somewhat cloudy and had a pronounced rancid odor, but had only a slight deposit or resinous film on the sides of the bottle

The apparent lengthening of the induction period, by the addition of water to cod liver oil, led to the washing of a sample of cod liver oil with three portions of distilled water The volume of water used for each washing was the same as the oil volume The oil was collected and filtered and samples were set aside for observation At the end of eight months the following samples were observed

Washed cod liver oil exposed to oxygen Retained natural color, showed very thin film, and the odor was only approximately 50 per cent as rancid as the control There was a slight deposit on the sides of the bottle

Washed oil + 5 per cent added water No film formed, a very slight deposit in bottle, 50 per cent, approximately, of rancid odor and a heavy white deposit in the bottom of the bottle

Control Dark yellow color, with a thin oxidized film, a strongly rancid odor and a small deposit on the sides of the bottle Duplicate samples were held at 50° C The control and washed oil samples showed heavy gummy deposits, resinous in appearance The washed oil + 5 per cent water showed no gummy deposit but did have a heavy film on the surface

There is apparently some substance present in cod liver oil which can be removed or inactivated with water, thereby prolonging the induction period of oxidation Perhaps in the sample washed with water, this substance reappears after oxidation begins and it may be that water present in the oil absorbs or hydrolizes this substance, thereby further preventing the oxidation

COMPOUNDS FAVORED AS ANTIOXIDANTS

The work done in all fields, for the prevention of oxidation has led to the establishment in general of favored types of compounds as antioxidants Following are several of these more favored types Phenolic compounds, hydroxy compounds, aldehydes, quinones, sterols, amines and alcohols

Ammonium compounds, sugars, and in many isolated instances some other compounds have unexpectedly shown inhibitor action Oxygen itself, acts as an inhibitor in the reaction between hydrogen and chlorine

COMPOUNDS USED IN THIS EXPERIMENT

A number of organic compounds were picked at random for determination of their antioxidant properties Principally these compounds come under the classes named as favorable antioxidants Flint-glass bottles of about one pint capacity were taken, in each bottle were placed 100 Gm cod liver oil containing 0 5 per cent of the chemical, the bottles were filled with oxygen and stoppered tightly and connected to a mercury gage to measure the amount of oxygen absorbed These bottles were set in a cabinet and a temperature of 58° to 60° C was maintained Two 100-watt lamps provided the heat, as well as light for whatever photochemical effect might be produced The experiment ran for a forty-hour period and the following results show the absorbed oxygen, no regard being given to color developed

Hydroxylamine Hydrochloride, NH OH HCl	0 00 cc O_2 absorbed in 40 hours
Alpha Naphthol $C_{10}H$ OH	0 50 cc O absorbed in 40 hours
p-Phenylenediamine, $NH_2C_6H_4NH_2$	3 90 cc O_2 absorbed in 40 hours
p-Dimethylaminobenzaldehyde, $(CH_3)_2NC_6H_4CHO$	4 55 cc O absorbed in 40 hours
Thymoquinone, C_6H_2O [1–4] CH_3 [2] C_3H_7 [5]	5 00 cc O absorbed in 40 hours
Blank Cod Liver Oil	5 05 cc O absorbed in 40 hours
Triphenylamine, $(C_6H_5)_3N$	5 15 cc O_2 absorbed in 40 hours
p Hydroxybenzaldehyde, C_6H_4OCHO	5 35 cc O absorbed in 40 hours

The *p*-Hydroxybenzaldehyde was in this case the least effective, oxidizing to such an extent in twenty-four hours that it was removed This rapid indication of oxidation cannot be definitely regarded as disqualifying a chemical, for there are two views to be taken of the induction period When an induction period is delayed or prolonged it may mean that the inhibitor used is one which will be protective by permanently preventing oxidation or it may be temporarily preventative and at the end of this temporary period oxidation may proceed with increased rapidity A second view to take of the induction period is that when it is extremely short, it may be an indication that the chemical has a great affinity for oxygen and is taking up the oxygen for the protective benefit of the substance to which it has been added From either viewpoint the possible value of the chemical cannot be definitely decided However, those chemicals which show a prolonged induction period are usually of value

A second experiment, made in the manner of the one just outlined, using a different sample of cod liver oil gave the following results

Alpha Naphthol, $C_{10}H_7$ OH	0 00 cc O_2 absorbed in 40 hours
Blank (plain cod liver oil)	3 95 cc O_2 absorbed in 40 hours
Benzophenone, $(C_6H_5)_2CO$	5 00 cc O_2 absorbed in 40 hours
8 Hydroxyquinoline (CH CH)C_6H_3 OH N CH	5 05 cc O_2 absorbed in 40 hours
Ergosterol, $C_{27}H_{42}O$ H_2O	5 10 cc O absorbed in 40 hours
Phenyl alpha naphthylamine, C_6H_5 $C_{10}H_6$ NH_2	5 10 cc O_2 absorbed in 40 hours

Duplicate cod liver oil samples of 100 Gm each, with 0 5 per cent of chemical added, were placed in an incubator at 50° C At the end of one month the samples appeared as follows No resinous film had formed in samples containing *p*-Phenylene diamine, *p*-Dimethylaminobenzaldehyde, Hydroxy-methyl-anethol, Alpha-naphthol, Thymoquinone, Phenyl-alpha-naphthylamine, Beta-naphthol, Thymol

A slight resinous deposit formed in samples containing 8-Hydroxy-quinoline, Triphenylamine, Benzophenone

A noticeable deposit of resinous character formed, on the sides of the bottles at the surface, in samples containing *p*-Hydroxy-benzaldehyde, Menthol, Ergosterol, Hydroxylamine hydrochloride, Plain cod liver oil

By the same method samples of olive oil were tested using

Menthol, $C_{10}H_{19}OH$	0 00 cc O_2 absorbed in 40 hours
Alpha-naphthol, $C_{10}H_7OH$	0 00 cc O_2 absorbed in 40 hours
Blank	3 80 cc O_2 absorbed in 40 hours

Further tests were made with olive oil, measuring the absorbed oxygen in the same manner and using 100-Gm samples of oil containing 0 5 per cent of chemical In this test the chemicals used were hydroxy compounds and organic acids

Tartaric acid, $C_2H(OH)_2COOH$	0 00 cc O_2 absorbed in 49 hours
Anisic acid, $C_6H_4OCH_3COOH$ [1 4]	1 70 cc O_2 absorbed in 40 hours
Hydroquinone, $C_6H_4(OH)$ [1 4]	3 30 cc O_2 absorbed in 49 hours
Pyrocatechin, $C_6H_4(OH)_2$ [1 2]	4 70 cc O_2 absorbed in 49 hours
Benzoic acid C_6H_5COOH	4 90 cc O_2 absorbed in 49 hours
Resorcin, $C_6H_4(OH)_2$ [1 3]	5 00 cc O_2 absorbed in 40 hours
Camphoric acid, $C_8H_{14}(COOH)_2$	5 10 cc O_2 absorbed in 49 hours
Salicylic acid, $C_6H_4(OH)COOH$ [1 2]	5 30 cc O_2 absorbed in 40 hours
Blank (plain olive oil)	5 30 cc O_2 absorbed in 49 hours

It will be noticed that three of these samples (salicylic acid, resorcin and anisic acid) ran only 40 hours, they were removed at that time because they were the only samples which were showing absorption of oxygen The induction period on all other samples occurred after the fortieth hour

As a check on the oxygen absorption, 5 cc of each sample were shaken with 5 cc of alcoholic potassium iodide solution As soon as the mixture separated into two layers the tubes were arranged in order according to liberated iodine shown The order was

1	Salicylic acid	7	Pyrocatechin
2	Resorcin	8	Hydroquinone
	Anisic acid	9	Tartaric acid
	Camphoric acid } 3–4–5–6	10	Unexposed olive oil
	Benzoic acid		
	Blank		

Numbers 3 to 6, inclusive, were so nearly equal in color that it was not possible to determine the order of arrangement It should be noted that this test gave very consistent results with the measured oxygen absorption, the greatest difference by measurement being 0 4 cc between the benzoic acid sample and the blank Anisic acid would without dispute hold position No 3 when its induction period of forty hours is considered Blank tests run by adding these chemicals to the alcoholic potassium iodide did not change the positions It is also seen that while three dihydroxy benzenes were used, no consistent results were obtained in regard to the positions of the hydroxyl groups Hydroquinone, with the OH groups in the 1 4 positions, is the best antioxidant and if wide separation of the OH groups is an advantage, resorcin should be better than pyrocatechin, such, however, is not the case Blank tests should always be made with the alcoholic potassium iodide to determine whether or not the chemical under examination liberates iodine In a

further experiment phloroglucin, $C_6H_3(OH)_3 + 2H_2O$, pyrogallol $C_6H_3(OH)_3$ [1 2 3] and tartaric acid were found very effective in the order named

Some of these chemicals used in these experiments were not soluble in a proportion of 0 5 per cent, but the results are given regardless, for the insolubility in this proportion would merely indicate that a smaller amount would be necessary

Rogers and Voorhees (14) in their work on gasoline have used a few of these chemicals, in addition to many others, and with favorable results

Three compounds typical of as many chemical groups were taken for feeding tests upon white rats, and Vitamin A assays These three compounds beta-naphthol, thymoquinone and hydroxy-methyl-anethol preserved the appearance of the cod liver oil as it was naturally, and prevented the formation of any resinous film There was no apparent difference in the Vitamin A activity as compared with a control sample, indicating that there was no deleterious effect of the compounds on the vitamin activity The compounds did not, however, aid in retaining the vitamin activity of the oil to give it any advantages over the control sample of the same age Feeding tests upon a more extensive scale and with several of the other compounds used as antioxidants might show some that preserved the vitamin activity in addition to the physical characteristics of the oil

CONCLUSIONS

It can be stated definitely, that there is no absolute means of pre-determining the value of an antioxidant in oils and fats merely from the chemical structure of the compound

Apparently the naphthols, quinones and hydroxy compounds are three of the most dependable types

The "trial and error" method must be used to determine two things—*first*, the possible value of the antioxidant and *second*, the amount necessary to give the maximum activity

While this paper involves only the use of antioxidants in oils, work done of a similar nature in aqueous solutions bring conclusions that parallel those just given

Thanks are due to Charles R Eckler for his work on the vitamin activity of the cod liver oil, and to W J Rice for criticisms

ELECTROLYSIS OF SODIUM IODOBISMUTHITE SOLUTIONS *

BY A E JURIST AND W G CHRISTIANSEN

Iodobismitol, a solution of sodium iodobismuthite and sodium iodide in ethylene glycol, has been shown by Hanzlik, Mehrtens, Gurchot and Johnson (1) to be of value in the treatment of syphilis Sodium iodobismuthite has the empirical formula—Na_2BiI_5—and has been described by Nickles (2), Astre (3) and Draggendorf (4) Hanzlik has stated that the bismuth in this compound, more especially in Iodobismitol, is anionic, whereas most bismuth solutions contain cationic bismuth, the anionic character of the bismuth is reported as being related to the therapeutic efficacy of Iodobismitol The present paper describes in detail a simple and rapid method by which the migration of the bismuth in Iodobismitol may be demonstrated, this method was suggested to us by Hanzlik

APPARATUS

The cell is a U ' tube having legs 20 cm long and 7 mm internal diameter A stop-cock is sealed into each leg 15 cm from the top, this cock makes it possible to fill the bottom of the ' U" and the cocks with the solution to be tested, close the cocks, clean the upper part of each leg completely (this is essential) and fill the tubes above the cocks with any desired liquid so that there will be no traces of the test solution in the upper parts of the legs, *i e*, the electrode chambers and so that the division between the test solution and the overlayering liquid will be sharp When the cell has been filled platinum screen electrodes which are connected to a 110 volt direct current are inserted into the liquids in the electrode chambers so that the bottom of each electrode is 7 5 cm above the stop-cocks

PROCEDURE

Iodobismitol is placed in that portion of the cell between the stop-cocks, filling the cocks The electrode chambers (the legs above the stop-cocks), after completely removing any traces of the Iodobismitol solution, are filled with 75% aqueous acetic acid The electrodes are inserted, the current is turned on and the stop-cocks are carefully opened

OBSERVATIONS

1 Current—At the outset the current flow is 0 21 m a but it gradually rises to 0 62 m a at the end of three hours

2 Migration—(*a*) Shortly after the current has been turned on the red Iodobismitol solution moves toward the anode and can be seen above the top of the stop cock, whereas the level of the red Iodobismitol does not change on the cathode side

(*b*) After two hours the red color has risen 2 7 cm above the stop cock on the anode side and a noticeable amount of iodine is liberated at the anode No change is detectable in the liquids on the cathode side with the exception of a dark stain (bismuth) on the cathode

(*c*) After three hours the amount of iodine liberated at the anode has become so great that the migration of the red Iodobismitol solution toward the anode is obscured

3 Chemical Tests Demonstrating Migration—The stop-cocks are closed and the current is shut off The liquid surrounding the anode gives a positive test for bismuth and for free iodine The black stain on the cathode is removable with aqua regia and the residue obtained by evaporating the aqua regia gives a positive test for bismuth

The foregoing is the simplest and most rapid method for demonstrating the migration of bismuth during the electrolysis of Iodobismitol The chief difficulty

* Scientific Section, A PH A , Toronto meeting 1932

with the method is the tendency of the liberated iodine to obscure the extent of migration of the colored solution toward the anode This has been successfully avoided by using a different type of cell and different conditions as described below

APPARATUS

This cell (diagram 2) is specially designed to permit removal separately of the overlayering liquids in the electrode chambers, withdrawal of the iodobismuthite solution or addition of material (acid or sodium iodide) to the overlayering liquids or the iodobismuthite solution without disturbing the rest of the experiment Also, the electrodes are so placed in special side arms as to prevent any material, such as iodine liberated at the anode, from diffusing back and obscuring the phenomena to be observed during the electrolysis

PROCEDURE

A 1% solution of sodium iodobismuthite in ethylene glycol is placed in the "U" shaped portion of the tube between the stop-cocks It is overlayered with a 0 2% sodium iodide solution in ethylene glycol 3 parts—water 1 part, the space

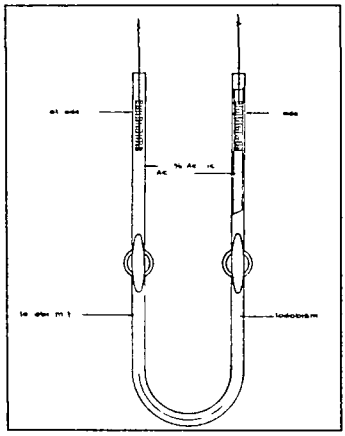

Fig 1

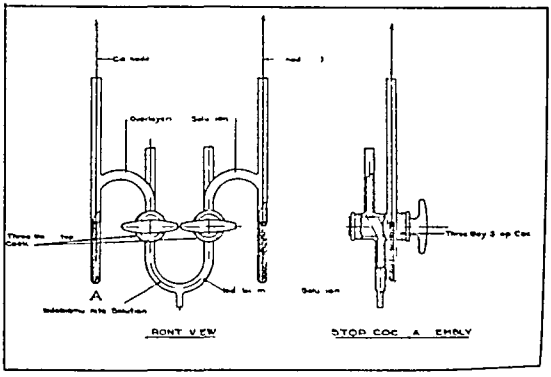

Fig 2

(A) surrounding the cathode is filled with $N/5$ hydriodic acid in ethylene glycol After twenty-four hours' electrolysis the current has risen to a maximum of 0 12 m a and remains at this level The cathode has a black stain on it as usual and the interface between the iodobismuthite solution and the liquid surrounding the cathode has dropped 2 5 cm while the colored solution has migrated 3 cm toward the anode which is surrounded by a brown color of free iodine At this point the stop-cocks are closed and the solutions surrounding the anode and cathode are withdrawn Fresh solutions are then substituted for them and the iodobismuthite solution remaining between the cocks is treated with sodium iodide equal to three-quarters of the amount originally present and thoroughly mixed The current is again turned on During the second twenty-four hours the current reaches a maximum of 0 4 m a and at the end of this period there is a depression of the interface between the iodobismuthite solution and the solution surrounding the cathode of 3 75 cm Again there is migration of color toward the anode with much liberation of iodine at the anode The solutions surrounding the electrodes are again

removed and replaced with fresh solutions and again the sodium iodide, 30 mg, is put into the iodobismuthite solution The current is again turned on and the maximum during the third twenty-four hours is 0 4 m a At the end of the third twenty-four-hour period the appearance of the experiment is much the same as at the end of the second twenty-four hours The electrolysis is allowed to proceed undisturbed for four more days, making a total of seven days At the end of this period the current has fallen to zero, the interface between the iodobismuthite solution and the liquid surrounding the cathode is 2 5 cm below the stop-cock and there is a noticeable black stain on the cathode The anode is surrounded by a brown iodine solution and the colored iodobismuthite solution has migrated toward the anode to a large extent The iodobismuthite solution remaining between the stop-cocks is extremely pale showing that most of the bismuth has been removed by electrolysis

ASSAYS

Bismuth in original iodobismuthite solution		5 9 mg
Bismuth in anode liquid		
(*a*) 1st stage	2 1 mg	
(*b*) 2nd stage	1 6 mg	
(*c*) 3rd stage	0 8 mg	
Total	4 5 mg	
Bismuth on cathode	0 4 mg	
Unmigrated bismuth	1 5 mg	
Total recovered		6 4 mg [1]

[1] This figure, the sum of 5 separate assays, is 0 5 mg above what it should be, due no doubt to limits of accuracy in the separate assays

This procedure shows that most of the bismuth in the solution will migrate toward the anode if fresh electrolyte, sodium iodide, is periodically added In this procedure anodic migration is not obscured by the presence of free iodine diffusing back into the iodobismuthite solution

A Ph A Resolution No 3 Dispensing of Liquor for Medicinal Purposes

Resolved, that the Officers and Council of the AMERICAN PHARMACEUTICAL ASSOCIATION be instructed to take such steps as they may deem necessary in the event of repeal of the 18th amendment, to prevent the sale of beverage liquor in pharmacies or drug stores, and be it further

Resolved, that it shall be the declared policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to favor the dispensing of liquor for medicinal purposes only on physicians' prescriptions

A REACTION FOR PHENOBARBITAL *[1]

BY GEORGE D BEAL[2] AND CHESTER R SZALKOWSKI[3]

The tests described in the pharmacopœias of the United States, Great Britain and Germany direct the use of mercuric nitrate or mercuric chloride for the identification of barbital and phenobarbital Since barbital, phenobarbital, dial (diallylbarbituric acid) and other barbiturates produce a white precipitate with both of these reagents it is the opinion of the authors that a more specific test is desirable in order to differentiate between the official compounds

Barbituric acid derivatives are usually identified by recrystallization (1) and few chemical tests for their identity are described in the literature Most of the tests are not specific and the presence of phenobarbital cannot be established with Millon's reagent, Denigès' reagent, phenylhydrazine and sodium nitroprusside, or sulphuric acid and naphthol

Paget and Desogt (2) used Millon's reagent to differentiate allylbarbituric acids from other barbituric acid derivatives Cobalt salts were used for the detection of barbiturates by Parri (3), Zwikker (4), Bodendorf (5), and Koppanyi *et al* (6), but they did not prove them to be entirely specific The murexide test, described by Handorf (7), is not sufficiently specific

Ekkert (8) used formaldehyde and sulphuric acid to differentiate phenobarbital from barbital and proponal He also (9) used selenious acid to distinguish phenobarbital from barbital Cinchophen and neocinchophen show a similar reaction with selenious acid

Lyons and Dox (10) employed *p*-nitro benzoyl chloride in the identification of alkylbarbituric acids van Itallie and Steenhauser (11) reported the behavior of barbituric acid derivatives toward solutions of ammonium phosphate, bromine water, Schweitzer's reagent, silver nitrate and barium hydroxide

Denigès (12) recrystallized the barbiturate and identified it by means of its crystal formation under a microscope Zamporo (13) showed that phenobarbital produces a color with sodium nitrite in presence of sulphuric acid while barbital does not Ramwez (14) nitrated the phenyl group and in this way was able to differentiate between barbital and phenobarbital

David (15) was able to differentiate between barbital and phenobarbital in admixture by dissolving the sample in ammonium hydroxide and treating with hydrogen peroxide He was able to show the presence of phenobarbital by the formation of a wine color He has also described a reaction for barbital with alcohol, nitrous acid and sulphuric acid, afterward neutralizing with sodium hydroxide Under his conditions barbital produces an orange-yellow color and phenobarbital a lemon-yellow Lagrace (16) used vanillin in sulphuric acid to identify dial This reaction is also obtained with allyl alcohol, terpenes, menthol, camphor and other similar compounds

Mohler's (17) test for benzoic acid seemed to the authors to offer the possibility of differentiating between phenylated and non-phenylated barbiturates by

* Scientific Section, A PH A , Madison meeting, 1933

[1] Published by permission of the chairman of the Committee of Revision, U S P XI

[2] Assistant Director, Mellon Institute of Industrial Research, Pittsburgh, Pa

[3] Assistant in Research in Pure Chemistry, Mellon Institute

nitration of the phenyl group Benzoic acid is converted to *m*-dinitrobenzoic acid by heating with sulphuric acid and potassium nitrate, made alkaline with ammonia, and reduced with colorless ammonium sulphide to the *m*-diamino compound, producing a red-brown color which changes to greenish yellow

We have found that the following procedure will yield a definite reaction with phenobarbital that is not duplicated by any of the non-phenylated derivatives of barbituric acid

In a large, hard glass test-tube mix 0 2 Gm of the sample with 0 5 Gm of potassium nitrate, and add 2 cc of sulphuric acid Heat the entire mixture in boiling water for twenty minutes, cool, and carefully add 3 cc of distilled water Make the solution strongly ammoniacal and boil gently to destroy any ammonium nitrite formed To the cooled mixture, add without mixing 2 or 3 drops of colorless ammonium sulphide U S P T S

Phenobarbital will show the formation of a reddish brown ring which diffuses and forms an orange color throughout the mixture On heating, the color becomes a little more intense and finally becomes greenish yellow Barbital does not give this reaction Benzoic acid produces a reddish brown ring on the addition of the ammonium sulphide, but on heating becomes yellow-green

SUMMARY

Mohler's reaction may be used to distinguish phenobarbital from barbital The progress of the reaction differs slightly from that with benzoic acid In the latter case the reddish brown ring diffuses to form a solution of the same color, and on heating changes to a yellowish green solution With phenobarbital, on the other hand, the reddish-brown ring diffuses to form an orange-colored mixture which is turbid Upon heating the color becomes more intense, shading into orange-red, and eventually becomes greenish yellow, the precipitate persisting

THE CHEMISTRY OF HEPTANE AND ITS SOLUTION *[1]

NO 7 THE SOLUBILITY OF METHYLAMINE IN HEPTANE

BY G O DOAK

While studying the action of methylamine on arsenic trichloride in heptane solution, it seemed desirable to learn something about the solubility of the base in the hydrocarbon For this purpose a commercial 33 per cent alcoholic solution of methylamine (Eastman Kodak Co) was transferred to an Erlenmeyer flask connected with a reflux condenser, which, in turn, was connected with a calcium chloride tower and this with four flasks containing heptane surrounded by a freezing mixture

In order to liberate the methylamine in the Erlenmeyer, it was not necessary to heat the alcoholic solution A current of nitrogen, the rate of which was regulated by bubbling it through glycerin, released the base Any alcohol carried over with it was held back in the $CaCl_2$ tower The first receiving flask was regarded as saturated when methylamine escaped from the fourth

The methylamine content of the heptane solution, after it had stood at room temperature (22°), was determined in 5-cc portions as the platinum double salt and by titration The amount of platinum obtained after ignition of the double salt revealed the amount of methylamine when computed after the formula B_2H_2-$PtCl_6$ in which B, the base, stands for methylamine In the titration, 5-cc portions were shaken with 25 cc of $N/100$ HCl (1) and the excess of acid titrated back with $N/100$ NaOH (2) using phenolphthalein as indicator Duplicates by both methods gave the following results recorded as grams per cc of heptane

	Platinum Double Salt	Titration
1	0 00109 Gm	0 000595 Gm
2	0 00113 Gm	0 000595 Gm
Average	0 00111 Gm	0 000595 Gm

Hence the titration method yielded results 45 9 per cent lower than the platinum double salt method Both methods were repeated, but in the titration method the methylamine was shaken out four successive times with four separate portions of $N/100$ HCl, namely, 25 cc , 15 cc , 5 cc and 5 cc , respectively This time the following results were obtained

1	0 00115 Gm	0 00127 Gm
2	0 00112 Gm	0 00125 Gm
Average	0 00114 Gm	0 00126 Gm

Whereas the results obtained by the platinum chloride double salt method were essentially the same as those obtained before, the modified titration method gave much higher results than those obtained in the first series, indeed 9 6 per cent higher than the precipitation method

* Scientific Section, A PH A , Madison meeting, 1933

[1] From the laboratory of Edward Kremers

In order to determine the solubility of methylamine in heptane at different temperatures, 5-cc quantities were saturated with the base Before shaking out the base with acid, nitrogen was passed over the heptane solution for 10 minutes to remove gaseous methylamine from the flask The results of a duplicate series of determinations are herewith tabulated as grams per 1 cc of solvent

t	I	II
40°	0 00024 Gm	0 00024 Gm
20°	0 00031 Gm	0 00028 Gm
10°	0 00048 Gm	
3°	0 00072 Gm	0 00081 Gm
0°	0 00120 Gm	0 00123 Gm
−5°	0 00137 Gm	0 00168 Gm
−10°	0 00128 Gm	0 00127 Gm
−13°	0 00075 Gm	0 00081 Gm

Methylamine is reported to liquefy at −7° at which temperature it shows its maximum solubility in heptane, the solubility diminishing not only above this point, but below as well

In order to check the solubility at the higher temperatures used, heptane was saturated at 0° and the temperature raised to 20° and kept there for 15 min before 5-cc portions were withdrawn for titration The same performance was repeated at 40° Again the results are tabulated

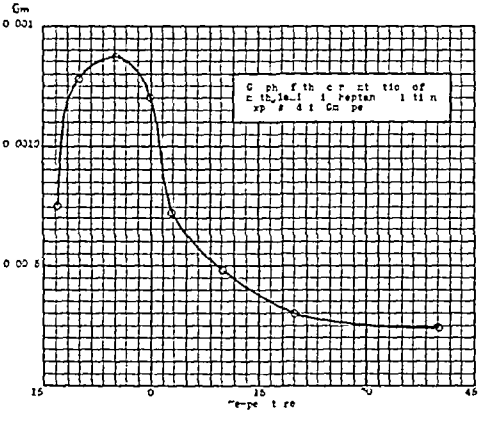

Fig 1

40°	0 000139 Gm	0 000149 Gm
20°	0 00027 Gm	0 00028 Gm

The accompanying curve reveals graphically the solubilities at different temperatures as already stated

A Ph A Resolution No 11 Historical Material for Museum and Library of Headquarters Building

Resolved that the Local Branches of the AMERICAN PHARMACEUTICAL ASSOCIATION, State Pharmaceutical Associations, Boards and Colleges of Pharmacy as well as other organizations and individuals interested in the progress and development of pharmacy be urged to supply documents of historical interest, relics and museum material to the museum and library of the Headquarters Building of the AMERICAN PHARMACEUTICAL ASSOCIATION at Washington

DETECTION OF GELATIN IN AGAR [1] [2]

BY GEORGE D BEAL[3] AND CHESTER R SZALKOWSKI [4]

The U S P X test for the detection of gelatin in agar reads as follows

'A solution made by boiling 0 1 Gm of Agar in 100 cc of water and cooling yields no precipitate with tannic acid T S "

This test has been reported to us as yielding a positive reaction with agar known to contain no gelatin Agar belongs to the galactan group of carbohydrates and should not react with the protein reagents In this investigation the effects of the common protein reagents on agar and agar adulterated with gelatin were studied

EXPERIMENTAL

Reagents —The behavior of the following reagents upon solutions of agar and agar containing gelatin was determined Copper sulphate T S , mercuric nitrate T S , tannic acid T S , and also a saturated aqueous solution, picric acid T S , a saturated aqueous solution and a saturated alcoholic solution, bromine T S , mercuric potassium iodide T S , phosphotungstic acid (1 10) and trichloracetic acid (1 4) The following special reagents were also used

Millon s Reagent —Dissolve 1 part, by weight, of mercury in 2 parts, by weight, of nitric acid and dilute with 2 volumes of distilled water

Robert's Reagent —Add 1 volume of nitric acid to 5 volumes of a saturated aqueous solution of magnesium sulphate

Tanret's Reagent —Dissolve 1 35 Gm mercuric chloride in 25 cc of water, add 3 32 Gm potassium iodide dissolved in 25 cc of water, dilute to 60 cc with water and add 20 cc of glacial acetic acid

Samples —Three samples of agar were available, all of which were asserted to be free from gelatin The nitrogen content of the samples, determined by the Kjeldahl method, were

Sample	% *N*	% Protein (*N* × 6 38)
A	0 20	1 276
B	0 13	0 829
C	0 0355	0 226

These were used in the proportion of 1 Gm dissolved in 100 cc of boiling distilled water, and are designated as Solutions A, B and C

Solution D —1 Gm of gelatin dissolved in 100 cc of boiling water

Solution E —1 Gm of Sample A containing 10% of gelatin dissolved in 100 cc of boiling water

Solution F —1 Gm of A containing 5% of gelatin dissolved in 100 cc of boiling water

Solution G —1 Gm of A containing 1% of gelatin dissolved in 100 cc of boiling water

Solution H —1 Gm of A containing 0 1% of gelatin dissolved in 100 cc of boiling water

Solution I —1 Gm of A containing 0 01% of gelatin dissolved in 100 cc of boiling water

Solution J —1 Gm of B containing 1% of gelatin dissolved in 100 cc of boiling water

Solution K —1 Gm of B containing 0 1% of gelatin dissolved in 100 cc of boiling water

---

[1] Published by permission of the chairman of the Committee of Revision U S P XI

[2] Scientific Section A PH A , Madison meeting, 1933

[3] Assistant Director, Mellon Institute of Industrial Research, Pittsburgh, Pa

[4] Assistant in Research in Pure Chemistry, Mellon Institute

All of the tests were performed at a temperature of 40–50° C unless otherwise specified

The tests and results may be described as follows

Tannic Acid T S added drop by drop produced a pronounced turbidity in Solutions A, B and C, and a precipitate in the remaining solutions The sensitivity was not especially changed by the use of a saturated solution of tannic acid

Millon's Reagent added drop by drop produced a turbidity in Solutions A, B and C, and a precipitate in the remaining solutions, which became slightly pink on heating

Mercuric Potassium Iodide T S and *Bromine T S* added drop by drop produced neither precipitate nor turbidity

Phosphotungstic Acid added drop by drop produced a slight turbidity in Solutions A, B and C, and a white precipitate in the remaining solutions

Trichloroacetic Acid produced no precipitate with the pure agars, nor when the gelatin concentration was 0 1% or less In the presence of larger amounts of gelatin a white precipitate was produced

Tanret's Reagent yielded no precipitate with the pure agars A faint turbidity was produced by 0 01% of gelatin, while the higher concentrations formed a precipitate

Robert's Reagent produced a precipitate only when the concentration of gelatin was 1% or greater

Biuret Reagent —To 5 cc of the agar solution was added an equal volume of potassium hydroxide (1 4) and, after mixing, 3 drops of copper sulphate T S The solutions of pure agar showed only the color of the reagent When 1% or more of gelatin was present the characteristic purple color of copper biuret was produced With the lower concentrations of gelatin the blue color of the copper reagent was modified by a slightly purple tint

Picric Acid T S was added dropwise to the agar solution and the mixture allowed to stand Saturated aqueous and alcoholic solutions of picric acid were also added dropwise to separate portions of solution A distinct yellow precipitate was formed in every instance when gelatin was present, while Solutions A B and C remained clear

CONCLUSION

Tannic acid produced a precipitate with pure agar and as a result it cannot be used as a test for gelatin Picric acid will precipitate gelatin but will not precipitate agar and is a very good reagent for the detection of gelatin An alcoholic solution of picric acid is more sensitive toward the gelatin than an aqueous solution

Tanret's reagent is not as sensitive toward gelatin as picric acid It will precipitate gelatin but not agar The biuret test is obtained with gelatin and samples of agar containing over one per cent of gelatin

Millon's reagent is a common protein reagent, but all proteins do not react with the reagent It will form a white precipitate with agar containing gelatin

No precipitates could be obtained with the metallic salts The best results were obtained with picric acid solutions and Tanret's reagent

In the authors' opinion, the U S P should prescribe the following test for gelatin in agar

Dissolve 1 Gm of Agar in 100 cc of boiling distilled water and allow to cool to about 50° C To 5 cc of the solution add 5 cc of picric acid T S , no turbidity appears within ten minutes (*gelatin*)

ORGANOLEPTIC BIOASSAYS * [1]

BY JAMES C MUNCH, GEORGE E BYERS AND HARRY J PRATT

"The tongue is more sensitive than the most delicate chemical reaction" (1) The literature on taste tests has been assembled (6)

The bioassay of capsicum has been proposed, studied in detail and adopted in U S P X (2, 3, 4, 5, 7, 9, 10) As a result of investigations undertaken by one of us, a proposed modification of the U S P X method has been published for consideration in the forthcoming XIth revision, (4, 5) This method is as follows

'Shake 1 Gm of coarsely powdered capsicum with 50 cc of alcohol in a stoppered flask for 3 hours Dilute 0 1 cc of the clear supernatant liquid with 100 cc of 10% sucrose solution Five cc of this dilution swallowed during 5 seconds will produce the same degree of pungency in the throat as 5 cc of 10% sucrose solution containing 16 mg of piperine per L In case 16 mg of piperine per L does not produce satisfactory pungency, the threshold concentration should be determined and corresponding alterations made in the standard for capsicum (0 1 cc per 100 cc or 20 mg per L)

Further studies on this method have been made in a class of twenty-six students during the last year It was found that very good agreements were obtained when proper recognition was given to the threshold of each investigator The usual piperine threshold was 16 mg per L Two students showed consistently values of 15 mg per L Several others occasionally required concentrations of 17 or 18 mg per L However, by proper correction to a standard of 16 mg consistent results were obtained in all cases The suggested value of 20 mg of capsicum per L as a standard of pungency was met by five commercial samples tested at this time

Four samples of commercial oleoresin were tested under the same conditions A weighed amount of oleoresin was dissolved in 95 per cent alcohol to represent a dilution of 1 Gm in 5 cc and used for tasting, according to the method reported The threshold of 3 5 mg per L previously recorded was met by all samples Several of the samples previously reported (4), were re-tasted three years after the original assays, and no change in minimum effective concentration was observed No change in the previous recommendation of 3 5 mg of oleoresin of capsicum per L appears necessary

A few studies have been previously reported on the pungency of ginger and its oleoresin (2, 6, 8) The limit of pungency of Philippine Ginger ranged between 200 and 400 mg per L in ten persons who were not otherwise standardized (8) For the oleoresin, perceptible pungency was reported at a concentration of 3 3 to 5 mg per L (2)

In this investigation a series of commercial samples of crude ginger were obtained and made into fluidextracts These were tested by dilution with 10 per cent sucrose solution, etc , following the method proposed for capsicum The pungency was detectable on the tongue and cheeks as well as in the throat These samples showed threshold values of 350 to 400 mg of ginger per L [2]

---

* Scientific Section, A PH A , Madison meeting, 1933

[1] Joint communication from the Department of Research School of Pharmacy, Temple University and Department of Pharmacology, Sharp and Dohme, Philadelphia, Penna

[2] We wish to acknowledge our appreciation of the courtesy shown by Sharp and Dohme, Inc , of Philadelphia, in furnishing the material used in these investigations

A few tests were made on the commercial oleoresins of ginger Four samples were tested and found to produce a threshold pungency in concentrations of 5 mg per L

CONCLUSIONS

1 A modified method for the bioassay of capsicum has been developed and proved successful in a series of assays by our students

2 As standards of pungency it is recommended that 20 mg of capsicum per L, and 3 5 mg of oleoresin of capsicum per L should produce the same degree of pungency as 16 mg of piperine per L (Threshold concentrations)

3 This method is suitable for the bioassay of ginger and its oleoresin

4 As standards of pungency threshold concentrations of 400 mg of ginger and 5 mg of oleoresin of ginger per L are suggested

NOTES ON THE B P COLORIMETER TEST FOR ERGOT *

BY F A UPSHER SMITH

The color test for ergot devised by Maurice I Smith (1) in 1930 soon found favor in Great Britain, so that it was adopted in the 1932 edition of the British Pharmacopœia

Wokes (2) found that the test fails to distinguish between the inactive and active constituents of ergot The four alkaloids, ergotoxine, ergotamine, ergotinine and ergotaminine, all gave the identical blue color with the Maurice Smith reagent when examined spectroscopically In spite of the fact that this test does not measure solely the physiologically active substances in ergot, it was adopted for the following reason The colorimeter test measures the total alkaloid with greater accuracy than the biological method measures the physiologically active alkaloid

In the Report of the Sub-Committee on Ergot of the British Pharmacopœia Revision Committee (3), the conclusion was reached that the results by the bio-

* Scientific Section, A Ph A, Madison meeting 1933

logical test are lower than those given by the chemical methods, the ratio of the average results is 2 1 In setting the potency of ergot at "0 05% of the total alkaloids of Ergot, calculated as ergotoxine," the committee took into consideration the evidence which suggests that 60 to 70% of the total alkaloid consists of ergotoxine Consequently, a total alkaloidal percentage of 0 05 is equivalent to an ergotoxine percentage of 0 03

Up to the present time the majority of authorities have regarded either ergotoxine or ergotamine as the physiologically active constituent of ergot The U S P Cock's Comb method, the Broom-Clark epinephrin-reversal method, and the Maurice Smith colorimeter test all agree in valuing the ergot or its preparations according to the amount of alkaloid present With this idea in mind, the fluidextracts of the U S P and of the B P have been made with acidified diluted alcohol, in order to ensure as high an alkaloidal content as possible The aqueous preparations of ergot, known to be deficient in alkaloid, have accordingly fallen into disrepute, in spite of the fact that the introduction of ergot into medicine was in the form of an infusion or decoction of the drug

The consensus of opinion on ergot might, therefore, be held to favor the use of preparations containing the correct proportion of alkaloids, such as the fluidextracts of the U S P and of the B P , and to warrant the discarding of aqueous preparations of ergot, deficient in alkaloids Strange to say, the situation has been complicated by the publication in June of last year of a paper by Dr Chassar Moir (4), Obstetric Unit, University College Hospital, London, which has once more reopened the whole question as to what is the active principle of ergot Working on human patients, Dr Moir found that the effect of ergot when taken by mouth was to induce with remarkable rapidity strong uterine contractions, which lasted only for a limited time This was in contrast with the known effect of ergotoxine, which is slower to start and more persistent in duration Moir concluded that there must be in ergot some principle not previously isolated and identified Dr Moir found that the aqueous extracts and fluid preparations of ergot, even when old and containing at best but a trace of alkaloid, possessed the activity ascribed to this unknown substance He found, however, that the B P liquid extract of ergot, which agrees closely in formula and composition with the U S P fluidextract of ergot, also possessed this effect in about the same degree It follows, therefore, that ergot contains an unknown active principle with a rapid but fleeting action, and alkaloids, such as ergotoxine, which are slower in action but more persistent It is possible that the unknown principle initiates the contraction of the uterus, and that in turn the ergotoxine (or the ergotamine) carries on the contraction for a longer time The search for Dr Moir's unnamed active principle will be followed with interest If its presence is confirmed, then the determination of the amount of alkaloid in ergot does not completely evaluate the drug

Several investigators have published results of their work on the colorimeter test, including M I Smith and Stohlman (5), Swanson, Powell, Stevens and Stuart (6), Powell, Schulze and Swanson (7), Wokes (8), Swoap, Cartland and Hart (9), J A C van Pinxteren (10), Allport and Cocking (11), Gerlough (12), Lozinski, Holden and Diver (13) and (14), and Smelt (15)

The author has tried the B P colorimeter test on several samples of ergot,

and compared results with those obtained by the Allport and Cocking modification In the B P test as devised by M I Smith, the standard consists of 1 cc of ergotoxine ethanesulphonate solution in water (containing 0 1 mg of anhydrous ergotoxine) to which is added 2 cc of a 1 in 800 solution of dimethylaminobenzaldehyde in 50% sulphuric acid v/v The resulting blue colors are matched in a colorimeter If the colors match, the sample contains 0 4% of alkaloids, calculated as ergotoxine

The B P method of extraction consists in taking 12 Gm of ergot in powder, defatting, and shaking the defatted powder with 120 cc of ether for 10 minutes Then add 0 5 Gm of light magnesium oxide diffused in 20 cc of water, and shake at intervals during 30 minutes Now add 1 5 Gm of powdered tragacanth, shake vigorously, filter through cotton, and transfer 100 cc, representing 10 Gm of ergot, to a separator The ethereal solution of the alkaloids is shaken with several portions of a 1% solution of tartaric acid, the ether removed by gentle heat and made up to 40 cc One cc of this solution represents 0 25 Gm of ergot When the B P method is followed on a hot day, there is difficulty in separating 100 cc of ethereal solution

Recently, Miss E M Smelt (15) has suggested a modification of the B P method of testing the fluidextract in order to prevent emulsification during the shaking with ether

> Five cc of the fluidextract are diluted with 25 cc of distilled water rendered slightly alkaline with 10% ammonia solution, and extracted with successive portions of 40, 35 30 and 30 cc of ether The first portion of ether should not be shaken too vigorously, but less care is needed in shaking the subsequent portions The ethereal solution is washed as directed in the B P, and then extracted five times with successive portions of 4 cc (or for strong liquids, 5 cc) of a 1% solution of tartaric acid After removal of ether the solution is adjusted to 20 cc or for strong fluidextracts, to 25 cc

Allport and Cocking have insisted on the use of pure anesthetic ether, to avoid oxidation of the alkaloids

The Allport-Cocking modification consists simply in adding a small amount of ferric chloride or ferric sulphate to the reagent Using a 10% solution of ferric chloride, 5 cc are diluted to 100 cc with distilled water The reagent is then mixed as follows

Dimethylaminobenzaldehyde	0 125	Gm
Sulphuric Acid, U S P	65	cc
Diluted Ferric Chloride solution	1	cc
Distilled water to make	100	cc

The advantage of this reagent consists in the full development of the color in about five minutes, even in the dark, so that prolonged exposure to light is unnecessary In following the B P test, the solution, after adding the reagent, is warmed to 45° before exposure to light, but this is not necessary in using the Allport-Cocking reagent, as the temperature rises to about 45° on mixing the liquids The solution should stand for at least 5 minutes before comparing the colors, in order to allow ample time for the color to develop The following results were obtained with six samples of ergot, against a fresh solution of ergotoxine ethanesulphonate

Sample	B P Reagent	Allport Cocking Reagent
1	0 170	0 171
2	0 210	0 191
3	0 082	0 073
4	0 100	0 090
5	0 145	0 134
6	0 236	0 222

(Results in Gm total alkaloids in 100 Gm ergot)

The use of ergotoxine ethanesulphonate as a standard raises the question as to whether that standard is uniform from time to time It seemed to be desirable to try to match this standard against a colored chemical solution For this purpose an ammoniacal solution of cupric sulphate in distilled water was prepared After numerous trials, it was found that a solution containing 0 67% of C P crystalline cupric sulphate or the equivalent amount of the desiccated salt matched a freshly prepared solution of ergotoxine ethanesulphonate containing 0 1 mg of anhydrous ergotoxine in 1 cc The similarity in color of the copper solution to the ergot solution treated with the B P reagent or the Allport-Cocking modification, is remarkably close It is best to match the colors in daylight when using a Bausch and Lomb Duboscq colorimeter The probable value of the use of a copper solution as a super-standard is seen in the following results In one set of experiments the same ergot samples were matched (*a*) against a freshly made B P ergotoxine solution treated with the B P reagent, and (*b*) against an ammoniacal copper sulphate solution containing 0 67% of C P crystalline cupric sulphate

Samples	B P Ergotoxine Solution and B P Reagent	Ammoniacal Cupric Sulphate Solution
1	0 170	0 162
2	0 210	0 168
3	0 082	0 074
4	0 100	0 080
5	0 145	0 126
6	0 236	0 199

Another set of experiments was made, replacing the B P reagent by the Allport-Cocking modification, using the same samples of ergot

Samples	B P Ergotoxine Solution and Allport Cocking Reagent	Ammoniacal Cupric Sulphate Solution
1	0 171	0 162
2	0 191	0 190
3	0 073	0 078
4	0 090	0 099
5	0 134	0 126
6	0 222	0 216

On the whole, these two sets of experiments show a fairly close agreement and suggest that the copper standard may have a useful function

It would be a distinct advantage if we could check up our ergotoxine standard against such a fixed standard, easily obtainable It would guard against using an ergotoxine salt or a solution of the same that had deteriorated The long-continued heat has delayed some of the experimental work that was planned, due to the

difficulty of handling the ether solutions on an aliquot basis These preliminary observations as to the use of copper sulphate as a check on the standard are offered in the hope that others may try it, and possibly improve on it

Recently, R Freudweiler (16) has suggested the use of a 2% solution of vanillin in concentrated sulphuric acid (free from nitric acid) in place of the B P reagent When 2 cc of the vanillin reagent are added gradually to 1 cc of an aqueous solution of the alkaloids of ergot, a purple color develops, which is stable for hours, and under the given experimental conditions, its intensity is proportional to the amount of alkaloid present Equimolecular proportions of ergotoxine, ergotamine and ergotinine are stated to give equal intensities of color Allport and Cocking (11) tried vanillin (and other aldehydes) in place of dimethylaminobenzaldehyde, but found none of them developed a color without exposure to bright light In trying out this reagent it was found that the temperature ran up quickly to 93° and in one case to 98° On adding the reagent to the ergotoxine solution surrounded by cold water, a temperature of 72° was reached A wine-red color was developed

A solution was then made of 2% vanillin in 65% v/v of concentrated sulphuric acid The color when fresh was bright golden yellow, but by the next day the bright gold effect had given way to a dull yellow On adding this solution to the ergotoxine, the temperature rose to 45–52°, without using precautions to keep the solution cool This temperature is not considered too high for the alkaloids The color of the solution was a beautiful purple But it was found a difficult color to match in the Duboscq colorimeter, either by daylight or artificial light, showing rose-red, and lacking the bluish or purplish tint of the ergotoxine solution The following figures give the results with the same samples of ergot as before, tested against a fresh solution of ergotoxine with the same reagent

Sample	2% Vanillin in 65% Sulphuric Acid v/v
1	0 148
2	0 167
3	0 069
4	Not tested
5	0 109
6	0 174

Combining all results into one table, the following figures make it easy to compare results

Sample	Sample and Ergotoxine Sol Treated with B P Reagent	Sample Treated with B P Reagent Compared with Cu Solution as Standard	Sample and Ergotoxine Sol Treated with Allport Cocking Reagent	Sample Treated with Allport Cocking Reagent Compared with Cu Solution as Standard	Sample and B P Ergotoxin Solution Treated with 2% Vanillin in 65% H_2SO_4 v/v
1	0 170	0 162	0 171	0 162	0 148
2	0 210	0 168	0 191	0 190	0 167
3	0 082	0 074	0 073	0 078	0 069
4	0 100	0 080	0 090	0 099	Not tested
5	0 145	0 126	0 134	0 126	0 109
6	0 236	0 199	0 222	0 216	0 174

(Figures represent Gm of total alkaloids in 100 Gm ergot)

In so far as I have used these reagents, I much prefer the Allport-Cocking reagent to vanillin The colors are easier to match, and this reagent has given satisfaction in the hands of many workers in several countries

It is to be hoped that the continued use of the Maurice I Smith colorimetric method, as modified by Allport and Cocking, will prove to be a trustworthy guide as to the potency of ergot since it affords a simple means of checking biologic assays There is need of further work on the relative values of results obtained by chemical and biologic methods of assay now in use The papers published by Lozinski, Holden and Diver (13) and (14) are a step in the right direction

YEAST EXTRACT IN PILL MAKING

Various yeast extracts are found to be suitable for pill making Ext faecis sicc (D A B VI) is used in conjunction with glycerinated water in pil arsen (0 001 Gm) pil creosoti (0 025 ml), and pil ferri redact (0 05 Gm) If the proportion of the powdered ingredients becomes too large for a satisfactory pill mass to be made with the dry extract, a small quantity of ext faec spiss (D A B VI) may be added For this purpose a mixture of equal weights of yeast extract, glycerin and water is kept ready and used as required, in this way the binding power of the dry extract is increased and a higher proportion of powders may be incorporated Examples include quinine hydrochloride and salol with equal weights of dry and moist extract of yeast The dry extract is suitable for preparing pills of ethereal oils, balsams, etc , and the pills are more soluble than when prepared with lanolin and kaolin etc Ext faec spiss or powdered yeast dried at 100° C may be used with the dry extract The powdered yeast is superior to liquorice powder as a binding agent, and pills made with it more readily disintegrate, owing to absorption of moisture with consequent swelling Examples quoted are for turpentine ((0 25 Gm), santal oil (0 5 Gm) and balsam of copaiba (0 5 Gm) with 4 Gm of dry extract and 8 Gm of powdered yeast for 100 pills If the pill formula already contains a soft extract, *e g*, extract of gentian the yeast extract may be omitted —R Ruf (*Pharm Weekbl*, 33 (1933) 880) —Through *Pharmaceutical Journal*

EPHEDRINE SALTS OF FATTY ACIDS AS SOLUBILIZING AGENTS IN MINERAL OIL SYSTEMS

BY E E MOORE *

It is well known that many alkaloids which are insoluble in mineral oil dissolve in mixtures of mineral and vegetable oils The importance of the free fatty acids present in the latter has not been fully recognized A good grade of olive oil will contain about one per cent free fatty acid Because of its alkaline nature the alkaloid can combine with this free acid to form a salt The latter is not only much more soluble than the original alkaloid in mineral oil but the resulting solution has much greater solvent power than the original oil In this work the formation of ephedrine salts of fatty acids and the solvent action of their solutions in mineral oil were studied

The purpose of this investigation was to prepare a mineral oil solution of ephedrine, a secondary aliphatic amine, and metaphen, an acidic organo mercurial

Solutions of ephedrine and acidic organo mercurials in vegetable oils may be readily prepared Investigation indicated that these were not true solutions, but colloidal suspensions They exhibit the characteristic Tyndall beam, and t e interfacial tension between the oil solution and water is lowered so that emulsions can easily be formed

These facts suggest that the system may be stabilized by a compound formed between the ephedrine and some substance present in the vegetable oil, presumably the free fatty acid The system would then consist of oil as the continuous phase, the amine salt of the mercurial as the discontinuous phase, and the amine soap at the interface as the stabilizing agent

Solubilities were studied in olive oil containing one per cent free fatty acid, neutral olive oil, and neutral methyl and ethyl esters of the fatty acids of olive oil Ephedrine is soluble in all the above oils, while metaphen and metaphedrin, formed from one mol each of ephedrine and metaphen, are insoluble

An excess of ephedrine was added to suspensions of metaphen and of metaphedrin in the different oils Only in the case of olive oil did solutions result The rate of solution was much more rapid with the metaphedrin than with the metaphen, which indicates that the amine salt of the organo mercurial must form before the latter can dissolve

When one per cent of oleic acid was added to the neutralized oils, they behaved like the olive oil Solutions resulted under the same conditions

Mineral oil was then tested When one per cent of oleic acid was added, solutions resulted as readily as with olive oil Further work showed that the oleic acid content could be reduced Preparations containing 0 1% oleic acid, 1 0% ephedrine, and 0 04% metaphen show no signs of separation after two years

Other acidic organo mercurials such as mercurosal, merthiolate and mercurophen were found to behave like metaphen in this respect Acidic organo metallic compounds other than mercurials were used Other amines which form oil-soluble soaps, such as the ethanolamines (1) can be used in place of ephedrine The unsaturated fatty acids of high molecular weight, oleic and erucic, give the most stable systems

* Abbott Laboratories North Chicago Ill

The rate of solution was estimated by the color development, while completeness of solution and stability were determined by analysis for mercury (2)

The most satisfactory method of preparation consists in first forming the ephedrine salts of the mercurial and of the fatty acid and then stirring these into the oil

The concentration of mercurial which may be obtained is limited by the requirement that on an average four mols of the ephedrine salt are required for each mol of the mercurial amine salt Stable preparations containing 1 0% of the latter have been made

A COMPARISON OF THE EFFECT OF PHENYL ETHANOLAMINE AND EPHEDRINE ON NASAL MEMBRANES *

BY T B GRAVE AND W G CHRISTIANSEN

Ephedrine solutions are widely used for application to nasal membranes, and Tainter (*J Pharmacol Exper Therap*, 36 (1929), 52) described the satisfactory behavior of phenyl ethanolamine on nasal membranes It was, therefore, of interest to prepare phenyl ethanolamine for comparison with ephedrine The phenyl ethanolamine was prepared by methods described in detail below and was tested as the hydrochloride in 1, 2 and 4% aqueous solution and as the oleate in mineral oil solution using in both cases corresponding ephedrine solutions as controls The solutions of the oleates were prepared by dissolving 5 Gm of the base with a chemical equivalent quantity of oleic acid in mineral oil so that the total volume was 100 cc The tests consisted of applying these solutions to the nasal membranes of both horses and human beings and observing the degree and duration of blanching and recording in the experiments on human beings the relief As a result of these tests we conclude that there is little difference between the phenyl ethanolamine and ephedrine

EXPERIMENTAL

Preparation of ω-Aminoacetophenone—$C_6H_5\,CO\,CH_2Cl + (CH_2)_6N_4 \longrightarrow C_6H_5\,CO\,CH\,[(CH_2)_6\,N_4]\,Cl$

$C_6H_5\,CO\,CH\,[(CH_2)_6\,N_4]\,Cl + 3HCl + 12C\,H_5OH \longrightarrow C_6H_5CO\,CH_2\,NH_2\,HCl + 3NH_4Cl + 6CH_3\,(OC_2H_5)_2$

The method of Mannich and Hahn *Ber*, 44 (1911), 1542, was used

23 Gm of chloracetophenone was dissolved in 140 cc of chloroform and stirred with 21 Gm of hexamethylene tetramine until complete solution took place (two hours) After standing over night the addition-reaction was complete, the mass of glistening crystals was filtered off and washed with cold chloroform Yield 40 Gm This product was 'alcoholyzed' by a mixture of 320 cc of absolute alcohol and 40 cc of concentrated hydrochloric acid After standing 72 hours at room temperature, the precipitated ammonium chloride was filtered off and the alcoholic solution concentrated *in vacuo* The crude ω-aminoacetophenone hydrochloride which separated

* Section on Practical Pharmacy and Dispensing Madison meeting 1933

was recrystallized from 10 cc of hot water Yield 6 75 Gm , melting at 190–192°, with decomposition

Catalytic Hydrogenation to Phenyl Ethanolamine—$C_6H_5CO\,CH\,NH_2\,HCl \longrightarrow C_6H_5\text{-}CHOH\,CH_2\,NH\,HCl$

0 2 Gm of platinum oxide (prepared by the method of Adams and Shriner, Org Syn , VIII 92) was reduced by shaking with hydrogen in aqueous suspension The platinum black was filtered off and added to the solution of 6 75 Gm of ω aminoacetophenone hydrochloride in 225 cc of redistilled alcohol and 12 5 cc of conc HCl Absorption of hydrogen took place at the rate of 2 cc per minute When 970 cc had been taken up, the reaction was stopped, theoretical for 1 mol 963 cc The filtrate from the platinum was evaporated to dryness *in vacuo* The residue was twice recrystallized from absolute alcohol ether, yield, 4 31 Gm melting point 165–168° with decomposition The composition of the compound was verified by analysis of its chloroplatinate

0 2 Gm of the hydrochloride was dissolved in 2 cc of absolute alcohol containing 0 25 cc of HCl and treated with 3 cc of 10% aqueous chloroplatinic acid The orange precipitate was washed with ice cold alcohol and dried at 105° Yield 0 29 Gm melting point 203–204° with decomposition

Analysis

Found Pt. 28 45%
Calcd for $(C_8H_{11}ON)_2\,H_2PtCl_6$ 28 53%

Preparation of the Oleate—In order to avoid all possibility of decomposition, the free base was prepared by the action of silver oxide and converted without isolation to the oleate 4 0 Gm of the hydrochloride was dissolved in alcohol and an excess of freshly precipitated silver oxide stirred in until the formation of silver chloride was complete The filtrate was evaporated *in vacuo* with the theoretical quantity of oleic acid (6 54 Gm) until free of alcohol

The neutral oleate thus obtained was dissolved in liquid petrolatum for the physiological tests

The biological tests on compounds reported herein were made in the Biological Research Laboratories of E R Squibb and Sons and we gratefully acknowledge their assistance

VARIATIONS IN HAND-MOLDED HYPODERMIC TABLETS *

BY S WALLEY BOWER

During the past year the question of Variations in Hand-Molded Hypodermic Tablets arose, which suggested the following observations

(*a*) What is the error in the manufacture of these tablets as based on the theoretical?

(*b*) What variations take place when the molding of the same lot of tablets extends over a period of several days?

(*c*) What is the relationship of the percentage error of the total count of the entire lot (as an average) with the error of tablets when weighed in small subdivisions?

---

* Section on Practical Pharmacy and Dispensing A PH A Madison meeting 1933

(*d*) What is the difference in error in the molding of one-half grain and one-fourth grain tablets?

Four lots of one-half grain morphine sulphate tablets were selected at random Each lot was molded by the same operator This person has been molding tablets for ten years and is experienced in the manufacture A steel plate containing 200 perforations was used in the making, thus turning out 200 tablets at each operation

The formula was based on the following Morphine sulphate, U S P 100 ounces, milk sugar, 16 ounces, making a total weight of 116 ounces, or 50,750 grains Thus, each 100 tablets was calculated to weigh 58 grains, the mixture theoretically yielding 87,500 one-half grain tablets

Inasmuch as one-fourth grain tablets are made from a mold the thickness of which differs from that of one-half grain tablets, these two sizes are considered separately

Four lots of one-fourth grain morphine sulphate tablets were selected These were based on the following formula Morphine sulphate, U S P, 100 ounces, milk sugar, 88 ounces, total weight, 188 ounces, or 82,250 grains Each 100 tablets in this instance weighed 47 grains, producing a total theoretically of 175,000 tablets

The molding extended over a period of days, as shown in the following table

TABLE I —TABLETS MOLDED EACH DAY

Days	Lot 1	Lot 2	Lot 3	Lot 4
		One-Half Grain Tablets		
1	9 000	27,000	14 000	4,000
2	22,000	32,000	24,000	23,000
3	26 000	29,124	30,000	28 000
4	24 000		20,887	26,000
5	9,802			7,590
Total	90 802	88,124	88,887	88,590
		One-Fourth Grain Tablets		
1	34,000	18,000	30,000	20,000
2	34,000	30 000	36 000	33 000
3	33 000	34,000	36,000	30,000
4	33,000	34,000	40 000	33 000
5	33 000	34,000	35 308	33,000
6	7,662	25,713		29,008
Total	174 662	175 713	177 308	178 008

TABLE II —ERROR IN YIELD BASED ON THE THEORETICAL

Lot	Yield	Theoretical	Over or Under Theoretical	Per Cen
		One-Half Grain Tablets		
1	90 802	87,500	3 302 over	96 40
2	88,124	87,500	624 over	99 49
3	88,887	87,500	1 387 over	98 44
4	88 590	87,500	1 090 over	98 77
		One-Fourth Grain Tablets		
1	174,662	175 000	338 under	100 19
2	175,713	175 000	713 over	99 59
3	177 308	175,000	2 308 over	98 70
4	178,008	175 000	3 008 over	98 31

In this connection, during several days' work, the human element and physical condition varying in the operator must be taken into consideration Fatigue might develop late in the day, which would have a tendency to vary the hand pressure in the filling of the molds and slow down the production Also, the person might work a longer period of time one day than another on this work This variation may be noted in Table II

The tablets were allowed to air dry for two days From each lot manufactured, 5000 tablets were counted and weighed, this being considered as a representative sample The percentage variation from the theoretical was computed Also, this percentage variation was compared with the average percentage variation of the entire lot, and the difference noted

TABLE III —PERCENTAGE VARIATION OF 5000 TABLETS

Lot	Weight of 5000 Tablets in Grains	Per Cent Variation from Theoretical	Average Per Cent Variation of Entire Lot	Per Cent Variation from Average

* High ** Low

To determine what variations occurred in 5000 tablets, these were divided into lots of 500 tablets The subdivisions were weighed and the percentage variation calculated from the theoretical

The theoretical weight of the one-half grain tablets was 290 grains, that of the one-fourth grain, 235 grains

As it was desired to note the greatest variation that could be found in each lot, the high and the low 500 tablets of each of these was now divided into five parts of 100 tablets each and weighed From these weighings, the percentage error was computed and tabulated This was based on the theoretical that 100 tablets of half-grain strength weighed 58 grains and 100 tablets of one-fourth grain strength, 47 grains

TABLE V —VARIATIONS IN THE HIGH AND LOW OF 500 TABLETS

* High
** Low

The figures in the above columns represent the greatest and least deviation from the required standard as found in a representative sample of 5000 tablets taken from each lot It is quite sufficient that these figures may be considered in basing an average Consulting the above table, the greatest and least variations of one hundred tablets may be noted By subtracting the low figure from the high, the

total variation in weight of each separate lot may be determined This represents the variation which may be expected and caused by the difference of hand pressure in the filling of the molds by the operator

TABLE VI —EXTREMES OF VARIATION

	Lot 1		Lot 2		Lot 3		Lot 4	
	Wt of 100 Tablets in Grains	Per Cent	Wt of 100 Tablets in Grains	Per Cent	Wt of 100 Tablets in Grains	Per Cent	Wt of 100 Tablets in Grains	Per Cent
				One Half Grain Tablets				
High	57 02	98 31	58 89	101 53	58 91	101 54	58 40	100 68
Low	53 55	92 33	55 63	95 92	55 59	95 84	54 53	94 03
Variation	3 47	5 98	3 26	5 61	3 32	5 70	3 87	6 65
				One Fourth Grain Tablets				
High	47 50	101 06	47 06	100 13	46 58	99 10	48 70	103 63
Low	45 32	96 43	45 37	96 53	44 47	94 63	45 76	97 36
Variation	2 18	4 63	1 69	3 60	2 11	4 47	2 94	6 27

The results of the weighings thus place the variations of the tablets within certain limits These limits may now be assumed to represent the extreme limits of error over or under the theoretical, and within which the tablets of each lot occur The following table shows this as percentage error

TABLE VII —EXTREMES OF VARIATION FROM THEORETICAL

	Lot 1 Per Cent Error	Lot 2 Per Cent Error	Lot 3 Per Cent Error	Lot 4 Per Cent Error
	One Half Grain Tablets			
High	1 69−	1 53+	1 54+	0 68+
Low	7 67−	4 08−	4 16−	5 97−
	One-Fourth Grain Tablets			
High	1 06+	0 13+	0 90−	3 63+
Low	3 57−	3 47−	5 37−	2 64−

SUMMARY

There does not appear to be any fixed ratio between the percentage error of the entire lot of these tablets, taken as a single unit, and the percentage error of the component subdivisions Several weighings of small quantities of tablets must be made to base an average However, the percentage error of the entire lot may serve as a guide Too large a percentage error, that is, too great an over or under yield in the total number of tablets of any single lot, should convey the idea that in the weighing of the subdivisions some of these might be found to be considerably over or under in strength

The variation is similar in both the one-half grain and the one-fourth grain tablets

The variations appear to be reasonable, when the nature of the work is considered, and to fall within reasonable tolerances Therefore, the present tolerances for hypodermic tablets should not be lessened with any new or proposed changes in the law

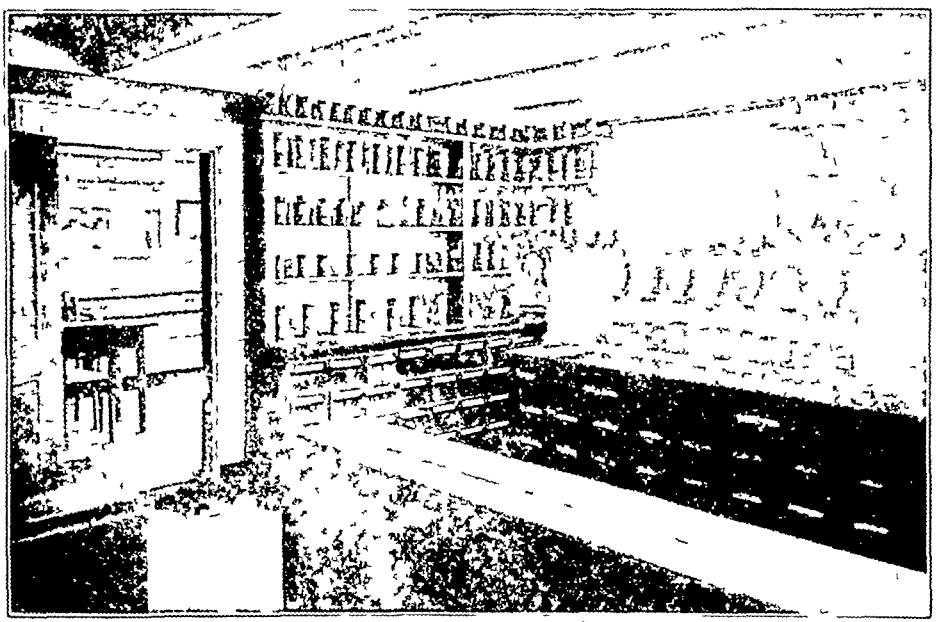
HENRIK IBSEN—PHARMACIST *

BY LOUIS H RODDIS, COMDR (M C), U S NAVY

Most critics would probably agree that the dramatist next in rank after Shakespeare was the great Norwegian poet, Henrik Ibsen It is of interest to pharmacists, particularly to those in this section of the United States where there are so many of Norse descent, that Ibsen was apprenticed to a pharmacist in Grimstead, Norway, and spent from his fifteenth to his twenty-first year in a drug store

Henrik Ibsen was born March 20, 1828, at Skien, Norway There was some admixture of Danish and German blood in his ancestry His family belonged to the petty aristocracy of clergymen, sea captains, professional men and small land-



Courtesy of the American Scandinavian Foundation

Fig 1 —The Ibsen Museum—The Apothecary s Shop—Grimstead Norway

holders His father was early impoverished and at the age of fifteen he had to earn his own living He originally had intended to study medicine but began as an apothecary's assistant in Grimstead where he remained for six years The building where he worked is now an Ibsen Museum The shop is not unlike many European shops, with narrow counters, rows of shelves and drawers reaching to the ceiling and filled with labeled bottles On the prescription desk are scales, mortar and pestle Many of the prescriptions he copied and filled and notes he made are preserved under a glass case and here are preserved the poet's spectacles and inkwell The drawer is shown in which he wrote the date 15/4/1850, the day before he left Grimstead for Christiania to prepare for entrance into the medical school of the University

* Section on Historical Pharmacy Madison meeting 1933

There is a little room in the shop where he lived, so that at night he would be available in case it were necessary to prepare an emergency prescription Here he did most of the miscellaneous reading and studying that formed the basis of his education for he was unable to carry out his ambition to study medicine or even enter the University A paper dated September 3, 1850, and found here showed that he failed in his entrance examinations in Greek and mathematics and his general standing was low While here at Grimstead he made some friendships with young men who exerted some influence over his early career and he also had a love affair with a servant girl, a woman ten years older than himself, by whom he had an illegitimate child Here, too, he wrote his first play "Cataline "

Fig 2—Ibsen Bust Como Park St Paul, Minn

Although when he left Skien, April 16, 1850, he severed his connection with pharmacy, Ibsen's general interest in medical subjects is shown in a number of his works, notably in two of his dramas, ' Brand" and "An Enemy of the People " In the former syphilis forms the central theme, and in the latter a physician, Dr Stockman, draws attention to the fact that certain natural springs of medicinal waters to which the town owes its fame and prosperity are infected and harmful, as a result, he is declared to be a public enemy by his fellow townsmen and driven from the community

Ibsen died May 23, 1906, at Christiania known to the whole world as one of the greatest figures in all modern literature

It must be remembered that two other great literary men, John Keats and O Henry, were trained in pharmacy and the great name of Dante was inscribed in the list of apothecaries of Florence

---

"Detection of murder by poison will be made more sure by a new and accurate method of analyzing human blood to detect and estimate extremely small quantities of alkaloid drugs such as cocaine, strychnine and morphine The new technique, devised by Dr Burnham S Walker and Elizabeth W Walker, of Evans Memorial and Boston University School of Medicine, will detect six parts of drugs in one hundred thousand parts of blood It will also be used in gaging the proper dose of these powerful drugs in legitimate medicine "—*Science*

' Two familiar green aniline dyes are effective in combating and subduing some of the common skin infections that are due to fungi These dyes, malachite green and brilliant green, were found to be outstanding in killing action, far surpassing all others tested, including aniline violet, fuchsin basic and gentian violet "—Dr A McCrea in *Science*

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS DEPARTMENT

Editor's Note 'The timely subject of Prof Eby's paper, which follows, is of great interest to all engaged in teaching in colleges of pharmacy He has covered the visual aids in pharmacognosy, giving information regarding different types and makes of apparatus, in a way that will be helpful to all teachers of the subject The Editor hopes that similar papers on visual aids in other subjects will be presented at our Teachers' Conference —C B JORDAN, *Editor* "

VISUAL INSTRUCTION IN PHARMACOGNOSY

BY FRANK H EBY *

During the last few years visual instruction has commanded the attention of many educators, and many institutions have made careful studies on this form of instruction and its value as an aid in teaching Instructors in the field of science have long recognized its value and many consider it one of the most important educational forces at their command Where careful studies have been made to determine its value, results indicate that there is a definite increase in learning for students who have the advantages of visual instruction as compared to the learning of students having the ordinary forms of class room instruction Recently a number of educational institutions have established departments of Visual Education which are equipped with all types of projection apparatus and slide and film libraries In most cases these departments have been established only after careful studies have indicated that visual instruction is a sound educational practice Improvements in projection devices and the application of new and improved methods in photography have been responsible for much of the progress which we have witnessed in this field

The importance of visual instruction has been emphasized very definitely during the last few years, however, this form of instruction has been an important part of the educational program in many professional schools for a long time The many developments which have taken place in this field would seem to justify a brief review of the possible applications of visual instruction in the teaching of Pharmacognosy

Most teachers of Pharmacognosy are using visual aids but they have been confronted with the problem of preparing or securing suitable material Very few if any of the organizations which sell or rent visual aids offer satisfactory material for this course and in order to develop good collections of slides and films, instructors have found it necessary to prepare most of the material which they use In many cases instructors have used their personal photographic and other equipment in preparing material for visual instruction This condition has been relieved since photographers' supply houses are offering their services for the preparation of slides and films, a service that is very valuable to the instructor who, through lack of time or facilities cannot prepare his own material

The instructor of Pharmacognosy occupies a position in which there are many

* Temple University

opportunities for visual instruction A variety of modern projectors and an almost unlimited field from which to select valuable material make it possible for the instructor with some initiative to develop a varied program which will do much to vitalize the course

There are five types of projection apparatus available for the teaching of Pharmacognosy The Lantern Slide Projector, Opaque Projector, Film Strip or Slidefilm Projector, Micro-Projector, and the Motion Picture Projector Each of these involves different projection principles consequently different material is required for the use of each machine The interest and initiative of the instructor will determine the character of the program which he may build around any one or several of these devices

The Lantern Slide Projector is the most widely used and certainly one of the most valuable projectors for use in the class room Since it is possible to prepare lantern slides on any subject that can be photographed there is practically no limit to its use An excellent example of the value of the lantern slide as an aid in teaching Microscopic Pharmacognosy has been demonstrated by George H Needham, of New York, who has prepared a number of photomicrographic lantern slides with the approval of Professor Ballard of Columbia University Each slide contains from one to four photomicrographs showing typical fields and identifying elements in important powdered drugs Slides of this type are a very important factor where the instructor wishes to aid the student in the correct identification of microscopic elements or where time does not permit the student to make a thorough study of an important drug in the powdered form A number of instructors have developed excellent collections of slides showing medical plants, their natural habits and their cultivation There are, however, very few good collections of lantern slides showing the various phases of Commercial Pharmacognosy, a field which offers a wide variety of subjects on which lantern slides may be prepared Where the instructor wishes to prepare lantern slides showing drawings, tracings or diagrams, Tracelene, a recently developed product, enables one to prepare quickly and inexpensively lantern slides of good quality Special glass and solutions used for preparing glass for latern slide drawings or tracings does not give the best results

The opaque projector permits the showing on a screen, pictures of all kinds of objects approximating flatness Photographs, pictures from books and periodicals, and drawings can be shown with this projector without any special preparation of the material The operation is very simple and the results satisfactory

The Film Strip, Film Slide or Slidefilm Projector is designed for showing pictures printed on standard motion picture films Two general types of projectors are being used One, a special machine designed for showing film strips only, the other, a special unit which may be attached to most of the standard lantern slide projectors In the preparation of film strips such materials as camera pictures, photographs, drawings, half-tones from books or anything that can be photographed may be used Pictures may be hand-colored and captions may be inserted with each picture The Society for Visual Education and other producers and distributors of visual aids will prepare film strips from your own material, placing as many as two hundred pictures on a single strip The advantage in using the film strip is the low cost per picture which permits the instructor to use a

greater variety of pictures or more completely picturize a subject Where visual instruction is used to a limited extent the film strip does not possess any advantages over the lantern slide

The Micro-Projector affords a means of direct projection of mounted specimens, a phase of teaching, especially in the laboratory that is of ever-increasing importance This projector makes it possible for the instructor of Pharmacognosy to point out to large groups many important details in a microscopic specimen, thus assuring more uniform and understandable assignments for student laboratory work It permits the instructor to differentiate the microscopic characteristics of authentic drugs and common adulterants or substitutes, thus making it possible to demonstrate certain microscopic sections which time would not otherwise permit the student to study

The Motion Picture Projector is the latest projection device to be used successfully in the class room In order to derive the full value of good motion picture photography a projector of good quality must be used Many excellent projectors are available for both the 35-millimeter and 16-millimeter films Most of the educational pictures which are now being used are supplied in both widths although many instructors prefer the narrow width films because they can be used in the more compact portable projector Since the introduction of sound motion pictures there have been a number of improvements in projection devices and the disc type unit which was first used in sound motion picture projection has been replaced in many instances by the more satisfactory sound-on-film projector

Within the last several years we have witnessed the remarkable development of the motion picture as an aid in teaching, and pictures dealing with specific themes have become a part of the teaching program in a number of institutions There is a wide range of subjects covered in these new films including Botany, Zoology, physics, chemistry, mathematics and music Their scientific character would seem to indicate that the motion picture can be used in almost any field of instruction A thorough knowledge of the uses of the many devices of photography including microscopic motion pictures, time-lapse photography, telescopic photography, animated diagrams and sound recording makes it possible to portray the important details of many subjects which cannot be satisfactorily portrayed by any other means

In considering the motion picture as an aid in teaching Pharmacognosy both silent and sound pictures could be employed and the subjects covered may include Lectures by outstanding educators, pictures protraying the various procedures employed in the preparation of crude drugs for pharmaceutical commerce, and pictures showing important drug industries such as the Opium, Cinchona and Spice industries and probably many others A few instructors in Pharmacy Schools have produced some very good motion picture films which they use in their own teaching programs and it is possible that others will produce some excellent films in the future However, what I have in mind, primarily, is the production of films of outstanding character and scope which cannot be produced by the individual instructor because of the expense and the lack of proper facilities Films of this type should be produced by skilled technicians under the direction of a capable staff of educators and then be made available for distribution to any School of Pharmacy that may wish to use them While I am interested in the motion pic-

ture as an aid in teaching Pharmacognosy, I believe there are many opportunities for using this type of visual aid in teaching other subjects in the Pharmacy School Curriculum The educational films which have been produced by the Erpi Picture Consultants are fine examples of what can be done with scientific material if the latest technical methods are employed and the production of the films is supervised by a capable staff

At this time I would like to suggest that some consideration be given to the idea of establishing a film library in the new Pharmacy Building at Washington No provisions have been made for a film library but I have been informed that there is ample space If worth-while educational films portraying American Pharmacy are to be produced, and I believe they will be eventually, it seems that the Pharmacy Headquarters would be the logical depository and center of distribution for these films Pharmacognosists would certainly play an important part in the development of a library of this kind and I believe steps should be taken in this direction

I am convinced that motion pictures can be used to considerable advantage in teaching Pharmacognosy as well as other subjects now being presented in pharmacy schools and I am not unmindful of the difficulties which may be involved in the production of films of outstanding character, however, in any program which we may propose we must understand that the purpose of motion pictures is not to afford entertainment or portray the unusual, but to present subjects which could not be presented with equal effectiveness by any other means

---

THE FIRST MODERN PHARMACOPŒIA *

BY EDWARD KREMERS

The word Pharmacopœia (1) did not appear until 1561 on the title page of one of the treatises now commonly designated by that name Moreover, some writers are inclined to recognize as a pharmacopœia any collection of pharmaceutical formulas, be they the *Luminare* of Nicolaus Præpositus (2), the *Formulary* of Scribonius Largus (3), or the directions carved into stone or brick of even more remote antiquity (4) However, most writers on pharmaceutical history prefer to regard as modern pharmacopœias those treatises, originally for the most part merely collections of formulas, that were compiled by special authority and made the pharmaceutical law of the city state which authorized and adopted them (5)

Viewed from this angle it is the Florentine *Receptario* which is generally recognized as the first (5) modern pharmacopœia As the title page indicates (6) it was compiled by the medical college at the request of the local apothecaries and published in 1498, the year in which Vasco de Gama circumnavigated the Cape of Good Hope, thus discovering the all water route to the (East) Indies This was six years after Columbus had started on his westward trip hoping to reach the same goal but ending in the discovery of the West Indies Both discoveries ultimately proved of the greatest importance to the materia medica, hence exerted an indirect influence on the making of pharmacopœias, though this influence did not manifest itself until much later (7)

* Section on Historical Pharmacy, A PH A , Madison meeting, 1933

As the first modern treatise of its kind, the Florentine book is of unusual interest to the student of the history of pharmacy Yet the information recorded in the so-called histories of pharmacy is most meager indeed

Scherer (8) (1822) records the titles of three impressions

Unfortunately, neither Phillippe (9) (1853) nor Phillippe-Ludwig (10) (1855) contain a subject index A casual examination of the table of contents and of the chapter on Italian pharmacy, however, failed to reveal a reference to the Florentine treatise

Frederking (11) (1874) in a chapter entitled "Aerzte und Naturforscher des 15 Jahrhunderts" makes the following remarkable statement "Ricettario aus Florenz, geb um 1450, schrieb ein med Werk in Italienischer Sprache, dessen lateinische Uebersetzung von Guanerius unter dem Tittel Antidotarium 1518 erschien"

Rice (12) (1895) refers to it as "the first formulary or pharmacopœia issued by some public authority"

Guareschi (13) (1897), the commentator on the national Italian Pharmacopœia, makes mention of an edition of1596

André-Pontier (14) (1900) makes no mention of the book

Schelenz (15) (1904) at least has something worth while to say, *viz*

"Die erste eigentliche Pharmakopoe, von einer Art Pharmakopoekommission bearbeitet und jedenfalls von gesetzlich bindender Kraft, wenn auch vorerst nur fuer den engen Kreis einer Stadt, ist das Ricettario di dottori del arte e di medicina del collegio Fiorentino all instantia delli Signori consoli della universita delli speciali Firenze 1498

' Diese Arbeit, die auf Andrängen der Florentiner Universita dei speziali, einer Art Apotheker-Gilde, von einer jedenfalls ad hoc von dem dortigen Arzte kolleg zusammenberufenen Kommission in Angriff genommen wurde, war grundlegend nicht nur fuer eine zweite Auflage von 1550, sondern auch fuer das Antidotar von Antwerpen von 1561 und das Kolner Dispensator von 1565, und sicherlich hat Cordus sie auch fuer seine erste deutsche Pharmakopöe von Nürnberg eingesehen und benutzt

"Ohne Zweifel ist die Bearbeitung des eben erwähnten Arzneibuches auf die Unannehmlichkeiten zurückzuführen, welche die Verschiedenheit der Arzneivorschriften in den mannigfaltigen von den Apothekern benutzten Kompendien, Antidotarien u dgl besonders in einer Stadt mit jedenfalls grossem Fremdenverkehr (wie in Florenz) nach sich ziehen musste"

The above quotation is taken from his chapter on "Mittelalterliche Arzneikunde" From the next chapter covering the 16th century, we quote the following paragraph

"1550 kam in Florenz das zweite, wieder vom Collegio de' medici bearbeitete Ricettario heraus, dessen Inhalt eingeordnet war in Semplici, Ricette, Misure und Succedanei Es gedenkt der Verfälschungen der ersteren Das Ricettario liegt der Antwerpener und Kölner Pharmakopoe zu Grunde" (16)

Tschirch (17) (1904) records the title of the first edition, also the dates of later impressions or editions, which we are not advised

In his chapter on "Pharmacopœias," Wootton (18), informs us that "The College of Medicine of Florence adopted an Antidotarium in the early part of that century (16th) and "

Danckwortt (19) (1913) makes the following statement

"Als erste Pharmakopœ in diesem Sinne ist ein Werk anzusehen, das im Jahre 1498 in Florenz erschien unter dem Titel Ricettario di dottori del arte e di medicina del collegio Fiorentino

all' instantia delli Signori consoli della universita dei speziali Die Florentiner universita dei speciali war eine Art Apothekerverein, auf dessen Wunsch das Arzneibuch von einer Aerztekommission herausgegeben wurde "

From Bruntz and Jalouv (20) (1918) the following statement may be quoted

' En 1498 le Collége des médecins de Florence public l'Antidotaire florentin, sous le titre *Ricetario di dottori dell'arte e di medicina del Collegio Fiorentino alla instantia delli Signori Consoli della universita speciali Firenze* Cet ouvrage est a juste raison, considére comme une des premières Pharmacopées officielles Il fut reédité d'abord en 1567 et souvent dans la suite 1571, 1574, 1597, 1623 1670, 1696 1789 "

LaWall (21) (1926) reproduces the title page of the 1696 edition which he enumerates in his Chapter "The Golden Seventeenth "

It is certainly worth while to quote these statements in full if for no other reason than to impress the student of our past with the painful meagerness of the information recorded Even the bibliographic data cataloged are extremely fragmentary and no attempt appears to have been made to discriminate between revisions and reprints Of a general pharmaceutical background, not to mention the equally important political, economic and social background, not a word, except possibly the most casual remark by Schelenz Certainly, the book that is pronounced the first official pharmacopœia, in other words, the first representative of that type of literature to which we like to refer as being the bible of the pharmacist, deserves more careful study and a more generous treatment

Having seen how little appears to have been known about this treatise to our pharmaceutical historians, let us now proceed to ascertain what may be learned about the book from other sources

First of all, let us try to find an answer to the question why Florence should have been the first city state to produce such a guide for its apothecaries

Strange as it may seem it was neither Venice nor Genoa the two principal seaports which played so important a role in the commerce of oriental drugs and spices that was the first to have a pharmacopœial standard officially adopted and in force Neither did Naples nor Messina, the two other seaports of importance attain to this distinction It was Florence, the inland commercial metropolis of the north central part of the Appennine peninsula that took the first step in this direction Moreover, a study of the pharmacopœial map of Italy reveals that it was in the Lombardy plain and surrounding territory that city-state pharmacopœias flourished, presumably for the simple reason that here agriculture, industry and commerce enjoyed a greater development than in the more mountainous portions of the peninsula The seaports enjoyed the possible advantage of the Levant commerce, but they presumably did not have the hinterland to develop either agriculture or industry Moreover Florence, while not in the Lombardy plain itself, was on the main highways across the Alps Pilgrims to Rome, crusaders going and returning, armies of the German emperors passed through this flourishing city It may have been, in part at least this international aspect of Florence, which as Schelenz points out (22) contributed to the desirability of a standard to be adopted by all apothecaries

As already stated a mere glance at the map of the city-state pharmacopœias of Italy reveals that the principal pharmacopœial development took place in the flourishing Lombardy plain A somewhat more careful scrutiny of this same map reveals the mighty Po and its northern tributaries also the Etch (Adige), the Brenta and the Piave with their sources in the Alps The valleys of these rivers naturally constituted as many routes Lakes Como and Garda afforded additional waterways farther to the north Beyond the water shed, the Rhone, the Rhine and the Danube have their origin and their valleys and those of their tributaries constituted as many routes into the transalpine countries Mention need only be made of the St Gotthard pass, the Engadin

and the Brenner pass to indicate the commercial, not to say anything about the military, importance of the topography to the north of Florence and to acquire a glimpse of the strategic significance of this city of the Medici

Having pointed out how the geographical position of Florence aided its economic development that caused the humanities and the arts to flourish, a brief review of its history cannot be out of place

'It would seem that as early as the time of Sulla there was a Roman colony on the site now occupied by Florence, another was established after the death of Julius Caesar, and it soon became a thriving town But it was not till the time of Charlemagne that Florence began to rise out of obscurity In the 11th century Florence and a great part of Tuscany were bequeathed to Pope Gregory VII by the Countess Matilda Under the protection of Rome, Florence speedily adopted the forms and institutions of a free city As early as the 11th century the Florentines were European traders and the possessors of commercial depots in the seaports and cities of France and England, and their skill as workers in gold and jewels had grown famous The 'arti' or trade gilds were of great importance During the bitter wars between pope and emperor which raged throughout Italy, Florence and all Tuscany seemed to have been saved from the feuds of Guelphs and Ghibellines—the former adherents of the papacy the latter of the empire But in 1215 Florence became involved in the great party struggle"

This struggle, supported by the French, lasted for two centuries and more At one time during this period the plague or black death, demanded 100,000 victims, viz in 1348 In 1406 Pisa, an ancient and illustrious republic, fell under the sway of Florence, becoming, as it were its seaport near the mouth of the Arno, in the beautiful valley of which Florence itself is located From 1434 the history of Florence is intimately bound up with that of the House of the Medici After various ups and downs Pope Clement VII of the House of Medici, formed a league with the Emperor Charles V which resulted in the capture of Florence in 1530 From this period on Florence loses her distinctive history, and is only known as the capital of the grand duchy of Tuscany (23)

As already pointed out, this meager skeleton of a general background, receives no pharmaceutical flesh and blood from the histories of our calling When, therefore, Luca Landucci's diary, covering the period of 1450 to 1516, was translated into English (24), it was hoped that this record of a Florentine apothecary might throw light on the history of the first modern pharmacopœia But while the author records faithfully the doings of the piazza on which his shop was located, not a word about the official guide True, he makes mention of the revival of the apothecaries' guild, but only to inform us that its members met to discuss the price regulation of candles, but not that the guild requested the medical faculty to compile a pharmacopœia for their guidance (25)

Once more, therefore, we are thrown upon the pharmacopœia itself for such internal evidence of its inception and evolution as we may glean from the title pages of its several editions or from the introductory prefaces

P S After this paper had been written, there came to the writer's attention a lengthy article on early Italian pharmacopœias published in an Italian medical journal as far back as 1887 Both language and place of publication may be responsible for the fact that none of the authors mentioned were aware of such an article Although this discovery will give new direction to further work on the subject, the facts recorded in this account remain unchanged

A STUDY OF THE HYDROGEN-ION CONCENTRATION OF TINCTURE OF DIGITALIS, TINCTURE OF ACONITE AND FLUIDEXTRACT OF ERGOT *

BY C JELLEFF CARR AND JOHN C KRANTZ, JR

DEPARTMENT OF PHARMACOLOGY, SCHOOL OF MEDICINE, UNIVERSITY OF MARYLAND

Introduction—This investigation was undertaken for the Revision Committee of the U S P A monograph on hydrogen-ion concentration has been tentatively accepted for admission to the U S P XI Thus, the hydrogen-ion concentration of official preparations will be stated where it is deemed desirable The determination of this constant must, however, yield information pertinent to the therapeutic efficacy or stability of the product The test outlined must be simple and yet reasonably accurate The colorimetric method meets these fundamental requirements and is accepted

The preparations that have been studied are Tincture of Digitalis, Tincture

* Section on Practical Pharmacy and Dispensing Madison meeting 1933

of Aconite and Fluidextract of Ergot The literature concerning the hydrogen-ion concentration of these preparations has been reviewed Representative samples of the preparations as purchased and as experimentally prepared have been studied As a result of these reviews and studies certain conclusions have been drawn and recommendations made

EXPERIMENTAL

Tincture of Digitalis—The physicochemical work on the hydrogen ion concentration of extractive preparations of digitalis began about a decade ago Takahashi (1) showed that the addition of 0 05 per cent to 0 1 per cent of hydrochloric acid to the infusion of digitalis increased the stability as shown by the frog method Tainter (2) showed the physiological activity of freshly prepared infusions of digitalis is independent of the hydrogen ion concentration He showed that the infusion may develop acid or alkaline reaction upon standing, depending upon the nature of the decomposition The hydrogen ion concentration of the tincture was found by Tainter to be the equivalent of $N/10{,}000$ hydrochloric acid, approximately p_H 4 6 Smith (3) in his studies on the determination of the hydrogen-ion concentration in alcoholic solutions investigated tincture of digitalis and found the range of p_H to be between 5 12 and 5 77 Of special interest is the work of Joachimaglu and Bose (4) who showed the stability of tincture of digitalis to be increased by the addition of 0 1 or 0 2 per cent of tartaric acid These investigators found the p_H of tincture of digitalis to be 5 88, with 0 1 per cent tartaric acid the p_H was 5 44 and with 0 2 per cent 5 13 The stability of the heart tonic value of the tincture was not markedly different when tartaric acid was added In 1921, Joachimaglu (5) had observed that the addition of sodium bicarbonate to tincture of digitalis materially increased the speed of deterioration

In 1930 Krantz (6) studied the buffer capacity of tincture of digitalis In this study the p_H of seven samples of digitalis are reported

No	p_H
1	5 88
2	5 67
3	5 70
4	5 67
5	5 68
6	5 73
7	5 61

The change in p_H upon aging of the tincture, when stored in indirect light is reported

p_H When Prepared	p_H After One Year	p_H After Two Years
5 88	5 66	5 38

In the same year, Krantz and Carr (7) studied the change of p_H of tincture of digitalis when stored in various colored glass in direct light

	p_H			
When Prepared	Flint Glass	Blue Glass	Amber Glass	Irradiated
	5 59	5 59	5 59	5 59
42 days	5 09	5 18	5 20	5 19
70 days	4 89	4 87	4 98	

In 1931 Krantz (8) studied the hydrogen ion concentration of infusion of digitalis and reported the following p_H measurements

No	p_H Infusion	p_H Tincture
1	5 81	5 90
2	5 96	6 20
3	4 97	6 02
4	5 86	5 90

In 1931 Haag and Jarrett (9) found no constant relationship between the hydrogen-ion concentration and the heart tonic value of the tincture The tinctures studied had a hydrogen ion concentration generally below p_H 4 50

Krantz and Munch (10, 11) in 1932 studied the influence of the alcoholic content of the menstruum upon the p_H of the tincture They report an average p_H of four tinctures U S P 5 75 The tinctures from the same drugs made with dehydrated alcohol showed an average p_H of 4 00 This vast increase in acidity is accompanied by a drop in heart tonic value However, the authors indicate that the diminution in potency is in all probability caused by the inefficiency of dehydrated alcohol in the extraction of the glucosides

Scoville (12) in his recent studies has buffered the tincture with sodium acetate and reports increased stability

Studies conducted by Munch (13), as chairman of the committee on bioassays of the AMERICAN PHARMACEUTICAL ASSOCIATION, seem to indicate that the rate of deterioration of the tincture is slow Therapeutically, the stability scarcely changes in two years

CONCLUSIONS

From these data the following conclusions are drawn

1 Tincture of digitalis made by the official process will have a p_H between 5 50 and 6 00

2 This tincture (considering the manner of its dosage) is a stable product

3 There is no unequivocal evidence to show that by buffering or adding acid to the product its stability can be increased

4 It has been suggested, therefore, that no p_H range for tincture of digitalis be stated in the forthcoming Pharmacopœia

Tincture of Aconite—In 1924 Swanson (14) published some studies on the stability of the tincture and fluidextract of aconite In this work the literature is quoted, indicating the stability of the alkaloid in acid solution Swanson concluded that, ' The rapid deterioration of tincture of aconite can be prevented by the addition of an acid to the finished percolate or menstruum " Further ' That the deterioration of the tinctures and fluidextracts is probably due to the decomposition or hydrolysis of the alkaloids, and may be a hydrogen ion concentration factor "

In a previous communication Swanson (15) had recommended adding 2 per cent acetic acid or 0 1 per cent hydrochloric acid to the menstruum as a stabilizer for tincture of aconite

In a subsequent communication Swanson and Hargreaves (16) showed a definite relationship between the stability and p_H of tincture and fluidextract of aconite Without acid the p_H of tincture of aconite is 5 13 The stable p_H range lies between 2 5 and 3 0 The authors state, ' The amount of acid required to produce the desired p_H depends upon the amount of alkaloids and inert material present in each lot of drug " About 0 03 cc HCl per 100 cc produces approximately this p_H This is approximately 2 9 cc of diluted hydrochloric acid per liter

EXPERIMENTAL

A sample of tincture of aconite was prepared by the official process The drug was a composite sample of three commercial specimens of aconite The p_H of the tincture was determined by the Wilson (17) type hydrogen electrode The tincture was diluted fivefold with a mixture of 3 parts of alcohol and one part of water At this concentration the tincture retains only a pale yellow color

p_H Tincture	p_H Dilution
5 56	5 90

Twenty-five cc portions of the tincture were treated with varying quantities of diluted hydrochloric acid The p_H of these was determined and also the p_H of the fivefold dilution by means of the hydrogen electrode These results are shown in the following table

No	Cc Dil HCl	p_H Tincture	p_H Dilution
0	0	5 56	5 90
1	0 15	3 65	3 85
2	0 30	2 32	2 61
3	0 45	1 95	2 42
4	0 60	1 72	2 22
5	0 75	1 58	2 06
6	0 90	1 46	1 96
7	1 05	1 38	1 85
8	1 20	1 32	1 71

These results are plotted in Fig 1, expressing the acid in moles

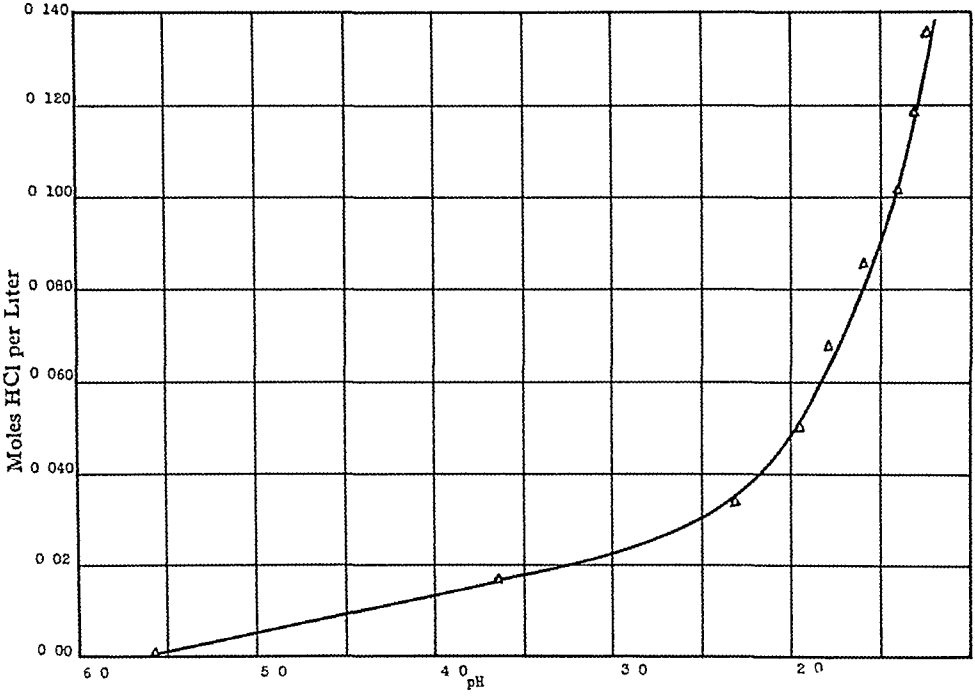

Fig 1 —Influence of strongly dissociated acid on tincture of aconite

The curve is a straight line between p_H 5 56 and 3 00 To change the p_H of this composite tincture 2 56 p_H units, 0 022 mole of HCl per liter was added to the buffer capacity of the tincture using the Van Slyke (18) ratio $\frac{-dB}{-dp_H} = \frac{-0\ 022}{-2\ 56} = 0\ 0086$ It is indeed of interest to note that the value obtained by Krantz (19) for tincture of digitalis was 0 0090

For practical purposes, the indicator solutions thymol blue and methyl orange were selected The p_H range of the former is 1 2 (red) to 2 6 (yellow), at p_H 2 2 an orange color is exhibited With methyl orange the range is p_H 3 1 to 4 4 Thus, a solution acid to methyl orange (p_H 3 1) and showing an orange color with thymol blue will be between p_H 2 2 and 3 1, *i e*, the stable range suggested by Swanson

The preparations in the foregoing table reacted to these indicators as follows

No	Thymol Blue	Methyl Orange.
0	Yellow	Yellow
1	Yellow	Yellow
2	Orange	Red

No	Thymol Blue.	Methyl Orange
3	Red	Red
4	Red	Red
5	Red	Red
6	Red	Red
7	Red	Red
8	Red	Red

Thus, sample No 2 meets the requirements and the p_H of this tincture is 2 32 electrometrically

Accordingly the following statement is suggested for the Pharmacopœia under the tincture of aconite monograph

Add to the finished percolate diluted hydrochloric acid in 0 5 cc volumes until 1 cc of the tincture diluted to 5 cc with a mixture of 3 volumes of alcohol and one volume of distilled water shows a red color when 6 drops of methyl orange T S are added, but no deeper than an orange color, when 5 drops of thymol blue T S are added to another similar dilution of the tincture (p_H 2 0 to 3 0) '

Swanson's stability curve for the tincture shows a long, flattened portion of maximum stability which is well included within this p_H range

As a matter of general interest, five commercial samples were purchased and the p_H determined as described previously These values are shown in the following table

A	p_H 3 48
B	p_H 3 05
C	p_H 4 03
D	p_H 2 75

Only sample "D" met the requirements of the test suggested, although each label stated that the hydrochloric acid had been added

CONCLUSIONS

1 A method has been described for determining the p_H of tincture of aconite which provides for variations in commercial samples of crude drug

2 A colorimetric method of controlling the p_H of the tincture has been described

3 The buffer capacity of the tincture has been determined

4 The Van Slyke ratio was observed to closely approach the ratio for tincture of digitalis

5 Samples of commercial tinctures showed a wide deviation from the suggested optimum p_H, which suggests the need for standardization

Fluidextract of Ergot —There seems to be no controversy regarding the favorable influence of acids upon the stability of fluidextract of ergot The acetic acid employed in the menstruum of the U S P VIII was changed to the more strongly ionized hydrochloric acid in the U S P IX and this formula was in turn adopted by the revision committee of the 1920–1930 decade During the last half decade, the interest in fluidextract of ergot, which had reached a condition of somnolent passivity, was revived and deepened by a variety of activities The ergot investigation of 1929 instituted by a senatorial committee the appearance of ergotamine tartrate on the market the indictment and restoration to grace of the cock's comb assay and the influence of hydrogen ion concentration upon the stability of extractive preparations of ergot have served to bring this drug an unusual degree of legal and pharmaceutical prominence The results of the studies of

hydrogen-ion concentration on the stability of the fluidextract are, however, the chief concern of this report

In 1929 Swanson (20) studied the standardization and stabilization of ergot preparations in relationship to the hydrogen-ion concentration factor In this work he showed that the fluidextract of ergot requires a certain amount of acid to prevent deterioration The graph set forth in Swanson's report shows that in the study of the fluidextract over a period of two years a p_H of 3 00 or less is necessary to prevent deterioration The importance of this, gleaned from the work of this investigator, cannot be overestimated for at p_H 5 35, the fluidextract lost 90 per cent of its activity over a period of two years, whereas, those fluidextracts having a p_H less than 3 00 retained more than 90 per cent of their original activity over this same period

In 1930 Thompson (21), in a comprehensive study of ergot and its extractive preparations, makes the following comment regarding the addition of acid

"The hydrochloric acid of the prescribed menstruum plays a double rôle *First*, it increases the efficiency of the menstruum in extracting the specific alkaloids, and *second*, it increases the stability of the product Proper control of this acidity is therefore of vital importance The use of organic acids, such as citric or tartaric, in place of hydrochloric serves no good purpose, in that such departure from the U S P method decreases the efficiency of the menstruum in extracting the alkaloids and also detracts from the stability of the finished product "

In a subsequent communication Thompson (22) studied the stability of various samples of fluidextract of ergot in relation to the hydrogen-ion concentration of the preparation Thompson lists the following data

No	Present Age Approx	Per Cent Deterioration in 18 Months	p_H
1	5 years	10 6	4 192
2	3 years	5 7	1 778
3	18 months	8 4	1 809

In this work Thompson calls attention to the fact that the fluidextract with the highest p_H showed the greatest degree of deterioration

Rowe and Scoville (23), in 1931 made a study of the stability of fluidextract of ergot using, respectively, hydrochloric acid and hypophosphorous acid as stabilizing agents Most of the preparations studied by these workers deteriorated rather rapidly and because in most instances the p_H was practically the same, no conclusions can be drawn from this work regarding the influence of p_H on the stability of the fluidextract

In 1932 Swanson (24) studied the stability of ergotamine tartrate crystals in hydroalcoholic solution in the presence of phosphate buffers These workers conclude that a solution of pure ergotamine tartrate crystals in 40 per cent alcohol with a hydrogen-ion concentration of around p_H 3 00 appears to be the critical point, where there is the least deterioration

Wokes and Elphick (25) observed that the efficiency of extraction of ergot with a 50 per cent neutral alcohol depended upon the acidity of the crude drug With more acid specimens of ergot (p_H below 5 5) the neutral menstruum was quite as effective as one to which either hydrochloric acid or tartaric acid had been added These workers suggest that owing to the presence of certain phosphate buffers in the drug, the amount of acid required for each sample of ergot cannot be definitely established Therefore, a control of the finished product by p_H adjustment seems to be advisable

Swanson (26) reported in 1932 that over a period of three years, there was a distinct deterioration in eight samples of fluidextract of ergot studied However, the samples with a p_H around 3 00 showed the least deterioration In the conclusion of this paper, Swanson, *et al* set forth the following comment "The data in this report show no definite conclusions that the deterioration of fluidextracts of ergot or a solution of pure ergotamine tartrate is prevented by definite hydrogen ion concentration "

In a subsequent investigation from Swanson's laboratory, Powell (27) reported on a series of eighteen fluidextracts These products were stored six months, at room temperature, and subsequently assayed by the Broom and Clark method and also by Smith's chemical method The results of the two methods of assay show a remarkable agreement Again, this worker observed that those fluidextracts, the p_H of which was close to 3, retained the greatest degree of original

potency At the close of the account of this investigation Powell made the following statements 'Some fluidextracts of ergot deteriorate rapidly regardless of hydrogen-ion concentration," and also ' The hydrogen ion concentration still appears to have some influence on the stability of fluidextracts of ergot '

Smith and Stohlman (28) conclude from a series of extensive investigations that a variation of p_H from 5 2 to 2 2 does not favor the stability of fluidextract of ergot

Swoap, *et al* (29) reviewed the work of previous investigators in the field and in conjunction with studies which they conducted concluded that the manipulation of the p_H of the fluidextract did not favorably influence the stability of the product Contrary, in a measure at least to the findings of Swanson and his associates, Swoap states that 'p_H variations between the limits of 3 0 and 6 1 do not enhance the stability of fluidextract of ergot," furthermore, manipulation of p_H in the finished fluidextract appears to be more harmful than beneficial "

CONCLUSIONS

In summarizing the foregoing opinions of the authorities in the field of the pharmacy and pharmacology of ergot, one is convinced that there exists absolutely no unanimity of opinion regarding the effects of the manipulation of the p_H The fluidextracts prepared by the official process containing 20 cc of hydrochloric acid per liter show a p_H of approximately 4 5 Apparently this value is subject to a considerable degree of variation However, as the evidence which is available to show that changing this value to p_H 3 is in no sense convincing, it seems contrary to the policy of the Pharmacopœia to establish such a requirement

Unless, therefore, prior to the publication of the forthcoming revision of the Pharmacopœia, there is unequivocal evidence produced to show that the manipulation of the p_H is an important factor in controlling the stability, the authors recommend that the acidity of the menstruum and percolate remain unchanged

JOINT SESSION OF THE SECTION ON EDUCATION AND LEGISLATION, A PH A, CONFERENCE OF PHARMACEUTICAL LAW ENFORCEMENT OFFICIALS AND CONFERENCE OF PHARMACEUTICAL ASSOCIATION SECRETARIES

ABSTRACT OF THE MINUTES HELD IN MADISON, WIS, AUGUST 31, 1933

The meeting of the Section on Education and Legislation, Conference of Pharmaceutical Law Enforcement Officials, and Conference of Pharmaceutical Association Secretaries, convened August 31st, at 8 00 P M The meeting was called to order by Chairman R L Rivard, who suggested that reports on enacted and proposed legislation affecting pharmacy in various states be taken up This idea was carried out

Alabama—W E Bingham stated that at the Toronto meeting he had made a report on legislative happenings and there had been no regular meeting of the Alabama Legislature since that time He said further that three years ago the Department of Agriculture had charge of the state inspectors and paid all expenses and salaries, but when the depression came on these expenses were thrown back on the Board of Pharmacy Two special sessions of the Legislature were held, the first, to create an income tax and place a special sales tax on drug stores, the sales tax was defeated but the income tax was passed The latter was submitted to the people and it was killed by them Another special session considered an income tax and a joint sales tax which applied to everybody Through combined efforts of the druggists and others the bill was defeated, later, an income tax was passed

Colorado—Charles J Clayton reported for Colorado, in part as follows There was no legislation during the regular session of the Colorado Legislature and everything espoused by the drug trade organizations was successful, no sales tax was imposed A 'Junior Capper-Kelly" bill became a law, this was introduced by the Retail Merchants Association of Colorado, the membership of which is chiefly made up of grocers, success of the 'Anti-Discrimination" bill was due to the same activities Colorado druggists espoused and secured the passage of a bill forbidding the use of "Drug Store' or 'Pharmacy" signs at or on places which are not licensed pharmacies by the Board of Pharmacy A bill was passed under which others than pharmacists may sell certain specified drugs in original packages, in places located more than five miles from a licensed pharmacy—a license fee of five dollars per year is imposed for this privilege A new alcohol law was passed, which liberalizes the conditions under which alcohol may be sold at wholesale, but forbids its sale at retail, except as a component part of some manufactured article which is unfit for beverage use

The sale of beer in bottles, not to be consumed on the premises was authorized at the regular session and at a special session held in August, this was amended to permit the sale of beer on draught, in any place that is willing to pay the license fee

Georgia—Robert C Wilson reported for Georgia as follows

A prerequisite law was passed which will require graduation from a generally recognized School of Pharmacy plus one year of drug store experience

In the reorganization of the State Board of Health two pharmacists and two dentists along with physicians now compose the Georgia State Board of Health

The "Uniform Narcotic Law" passed the Senate but was not acted upon in the House, largely due to the fact that physician members of the House blocked it until too late in the session to have it put on the calendar

A bill was introduced prohibiting the sale of barbituric acid compounds or derivatives and other hypnotics except on physicians prescriptions, but this failed of passage

An additional ten per cent tax on cigars and cigarettes to an original ten per cent was defeated

A tax of twenty-five cents per gallon on soda water syrup was defeated

Maryland—Robert L Swain reporting for Maryland said that the Legislature had a very hectic session A matter of early prominence was the financial status A general sales tax was proposed which later was dropped and a commodity tax was discussed, finally, there was no sales tax passed and there was also a substantial decrease in state taxes He referred to conditions in Maryland in saying that its bonds were sold at the highest price of any state bonds in recent

years A chain store tax, modeled on that of Indiana, was passed, a maximum of $150 is imposed when a chain reaches a total number of twenty stores There was considerable opposition but, finally, it was passed almost unanimously in the House, only five votes against it, and the Senate passed the bill unanimously

The Uniform Narcotic bill was presented The speaker gave an historical account of this model He referred to a meeting with the Committee in charge of the measure at which time it was pointed out that the proposed measure was unsatisfactory However, it was approved by the American Bar Association and the bill submitted in due course in about forty states As soon as it was introduced in Maryland a conference was arranged, at which time it was emphasized that certain specific amendments were necessary before the bill would be acceptable to the drug group It became evident that an effort was being made on the part of the Federal Commissioner of Narcotics to have the bill passed in Maryland as a proving ground At the hearing on the bill the Federal Commissioner of Narcotics and his legal staff were present, the Maryland organizations voiced their objections, the members of the Medical Society voiced their protest and also the American Dental Society and the State Board of Health of Maryland The hearing evidenced that the bill was hopelessly defective and the net results would be a great burden on druggists and others who were charged with prescribing and dispensing of narcotics The bill was finally defeated, only nine states out of the forty in which it was introduced passed the measure The speaker stated that the Federal Narcotic Commissioner is still working on the bill with the hope of making it more acceptable

It was provided by the Maryland Legislature that druggists cannot sell beer in any form A separate bill was enacted for the city of Baltimore and another for the other part of the state The Solicitor for the city of Baltimore had requested an interview with Dr Swain, who informed the solicitor it would be a mistake to have drug stores handle beer, the latter was pleased with the stand taken by Dr Swain During the course of discussion in the Legislature the members of the drug group voiced their opposition to the sale of beer in drug stores, and the Governor accepted of provisions recommended by them

During the year the Attorney General ruled that automatic vending machines could not be used for vending drugs A copy of this opinion was sent to the secretary of the Conference of the Law Enforcement Officials and to the secretaries of the various State associations Quite a number of states passed similar laws, prohibiting the vending of drugs by means of automatic vending machines

Massachusetts—Carl G A Harring stated that a Massachusetts bill prevented stores other than registered drug stores from displaying signs which indicated that they were registered drug stores, if they were not It was defeated in the Senate A bill was introduced which provided that insulin was to be given to every one who wanted it, this bill was defeated by the Board of Health Another bill proposed a beverage tax by which it would have become necessary to keep account of all sales and tax paid The bill was defeated The Uniform Narcotic" bill was introduced, it was defeated

Michigan—M N Henry reported for Michigan He stated that much legislation was proposed by druggists but little enacted A bill was introduced prohibiting the sale of drugs in other than drug stores, after considerable discussion the bill was defeated It is contemplated to bring the bill back into the Legislature this year A bill was proposed to cut out the *per diem* of members of the various Boards in Michigan A Paregoric" bill was introduced and this also was killed

A chain store tax for a chain of over three stores was passed, but vetoed by the Governor and passed over his veto A sales tax was passed and this is a great nuisance The average druggist is only able to collect about one half the tax Another bill was the Trades Practice Bill which provided that a chain must have uniform prices all over the state for each article, this was defeated

Pennsylvania—C Leonard O'Connell stated that they had some trouble with the Revenue Department in having prescriptions exempted from the Mercantile Tax This required that the Mercantile Tax Law had to be amended and while there was some difficulty it finally was amended and signed by the Governor

M N Henry, speaking for Michigan, stated that a bill was passed which provides that Assistant Registered Pharmacists' after five years may become full ' Registered Pharmacists "

Robert L Swain referred to the Pennsylvania matter spoken of by C Leonard O'Connell He said that this was probably due to the terminology It is much better to speak of prescription practice than prescription business

Indiana —F V McCullough stated that a tax of one fourth of one per cent had been placed on gross receipts

West Virginia —J Lester Hayman stated that the druggists had been very successful and had received, practically everything asked for The Governor called a special session of the Legislature for raising revenue After a 5 weeks' fight the session ended without revenue enactment A bill was prepared prohibiting sales of drugs by vending machines, which was passed A compromise on a sales tax resulted in a tax of three-fourths of one per cent A bill providing for registered drug stores was passed after considerable effort A chain store tax, maximum of $250 for each store over seventy five and $2 for an individual was passed A bill providing for a 50 cent tax on whiskey and an annual tax of $10 for the sale of medicinal wines was passed

Texas —Walter D Adams stated that there was not much to report from Texas There was a slight change in the State Narcotic Law sponsored by the State Medical Association

There was trouble, because the Attorney General declared that part of the law by which the State Pharmacy Board collected the state registration money and turned it over to the State Association was unconstitutional Attorneys were employed and, finally, they were convinced that if it was not turned over to the State Association it should be returned to the individuals The Attorney General, later, ruled that the law was constitutional About $9000 was involved, a test case was made and the druggists won out

Indiana —F V McCullough stated that the Indiana Legislature continued in session for about 100 days during the past year The ' Uniform Narcotic Bill" was introduced, but it was finally killed in the Senate It was reintroduced and the bill was turned over to an attorney of the Medical Association and Mr McCullough was asked to assist in rewriting the bill The objectionable features were cut out and the bill passed in that way A poison bill brought about considerable publicity on account of a poison case in Indiana at that time The bill passed the House but was killed in the Senate

A bill permitting the sale of beer in drug stores is in effect and in some stores it is being sold, in his opinion, it would have a demoralizing effect on the drug business An attempt will be made at the next session of the Legislature to prohibit the sale of beer in drug stores A license tax has been imposed for the sale of whisky and a tax of 25¢ a pint A chain store tax bill was passed requiring a payment of $3 for individuals and $5 for chains

South Dakota —Rowland Jones reported that the grocers endeavored to have more privileges in selling drugs and had a bill introduced permitting the sale of patent and proprietary medicines as well as household remedies After considerable discussion, household remedies were eliminated and the license fee was rasied to $3 for the sale of patent and proprietary medicines Wholesale houses encouraged a number of venders selling patent medicines, but as the grocers could not sell these most of the goods were returned A gross income tax was passed and one-half of one per cent for manufacturers and one quarter of one per cent for wholesalers This has raised a large amount of money and created quite a good deal of criticism The cigarette and cosmetic taxes were defeated

New Jersey —R P Fischelis stated that following some rather sad experiences in obtaining legislation, it was found preferable not to amend an existing statute as it gives the legislators a chance to amend in a way that is undesirable If the amendment does not go through as wanted the existing law is lost

In New Jersey they had found it wiser to supplement with a new act The first law passed by the present Legislature provides that prescriptions are to be compounded only by registered pharmacists, that a prescription bear the name and address of the customer and be kept on file In order to substitute ingredients of a prescription the consent of the patron must be given

Another supplement is the 'Barbituric Law " Products included in this law may not be sold at retail except on prescription and under the direct supervision of registered pharmacists

The Pharmacy Board now has to rule on several points of this law and information is being obtained from manufacturers A question has come up as to whether prescriptions of that type can be renewed unless advised by the physician The matter is now before the Attorney General for ruling Legislation has been responsible for bringing together the various professions

and among these the inspectors' consolidation bill which brings all the boards under one unit It has been presented several times during the past ten or fifteen years and came very nearly to adoption about three years ago The Governor asked the president of Princeton University to conduct a survey on the consolidation of state institutions with a view to economize This was hurriedly done and a great many statistics were used that did not apply at the present time One of the recommendations made was that the professional boards be consolidated and a conference was had on the proposal Formerly the expenses were paid out of the money taken in by the Board but now it has been suggested that the money raised be turned into the fund and an appropriation made to the Board of Pharmacy A former Attorney General was employed and finally it was agreed that the items be included in the budget, but that the Board be allowed to spend the money as collected and this has worked out very well Support has been given by the professional groups

Relative to the Uniform Narcotic Bill ' the editor of the *New York American* conferred with a group of professional people and told them he was going to have the bill introduced by the president of the Senate Secretary Fischelis called a meeting of drug groups and some changes were proposed, but before these could be printed the bill had been passed He commented, that this shows the power that is wielded by a large Metropolitan newspaper

The beer legislation was so worded that local communities could arrange the sale and, as far as he knew none of the drug stores were selling beer An opinion was given by the Attorney General prohibiting the sale of drugs by automatic vending machines

The Legislature is still in session (at this time) A bill was introduced providing that insecticides could only be sold by registered pharmacists

In speaking of the Pharmacy Board as the sole regulatory body for pharmacy, Dr Fischelis said that it seemed to him that if these various laws are to mean anything at all, they cannot be left in the hands of county or state officials They must come under the state boards as these boards are the only bodies qualified to enforce the law If it is under the State Board of Health a pharmacist should be on the Board, otherwise the Pharmacy Board should have supervision He thought it was very important for protecting the health of the public Local officers and district attorneys could not be depended upon to enforce these laws In New Jersey there is a working arrangement with the Board of Health and in cases of adulteration the Board prosecutes on the ground of protecting public health

Under the Narcotic Law, the matter of enforcement was left blank as the Board did not desire this work it being a duty for detectives and not for pharmacists The Board also did not have the necessary money and considerable money is required for enforcement Enforcement of laws should be in the hands of those who are qualified

J W Slocum asked why the State Board of Pharmacy bothered with the narcotic act In Iowa it was left to the Federal government

Secretary Fischelis said that they had a different proposition to contend with than those of an inland state There was considerable forging of prescriptions and the reason for the state narcotic law was to give help to the Federal government

F V McCullough stated that the Indiana Board of Pharmacy asked him to advise druggists who violated the narcotic law and warn them The Federal narcotic inspectors informed him that there had been a number of violations and forging of prescriptions They had the names of a number of violators who had ordered large amounts of paregoric shipped into the state

W H Rivard stated that in Rhode Island the narcotic law is enforced by Federal officials and that there is little traffic in narcotics and practically no forging of prescriptions

Connecticut—A legislative attempt to restrict the opening of drug stores was read by Miss Garvin in the absence of Mr Beirne, the author A very brief abstract of this report is given in the following

It was stated that pharmacists of Connecticut endeavor to pass laws which will serve the future—laws that will benefit the public and majority of druggists Opposed to class legislation the druggists of Connecticut consider the interest of the many instead of the few and these thoughts guided them in their legislative efforts during the year A law was enacted making it illegal to exhibit within or without a store, or advertise by any name that a place of business is a pharmacy unless a registered pharmacist is the owner or manager A fine of $200 or thirty days in jail is imposed for violation A law was passed permitting the sale of certain medicines in stores other

than pharmacies that are distant from regular pharmacies A tax of $10 is imposed for this privilege in cities of over 5000 population and in small towns a fee of $3 is exacted Under the new regulations the number of stores dealing in drugs and medicines, outside of pharmacies, will be reduced by one half or more

A bill was introduced and passed providing for a fee of $200 for the opening of a new drug store in Connecticut The bill reads, in part as follows

'Any licensed pharmacist, or any person, firm, or corporation employing a licensed pharmacist in a pharmacy, may apply to said commission for a license to sell at retail drugs medicines and poisons to be used in compounding medicines, and to dispense at retail medicines compounded from prescriptions of physicians in a pharmacy owned or managed by such pharmacist, or owned or operated by any such person, firm or corporation provided the pharmacy shall be under the supervision of a licensed pharmacist Said commission shall grant such pharmacy license when the registration shall be for a new pharmacy on the payment of a fee of $200 and upon satisfactory evidence to said commission that such pharmacy will be conducted in accordance with the rules and regulations of said commission Renewals of such licenses shall be granted for a period not to exceed one year upon the payment of a fee of $1 When an established pharmacy shall be moved to a new location, it shall be considered a renewal "

Comment was made on this measure in the following

A fee of $1 had been enacted in Connecticut for the opening of a new drug store This encouraged the opening of stores that were unnecessary In passing the new bill officials of the State Department of Health and the State Medical Society were very helpful The distinction will be noted of a new store and one that has been licensed, when a pharmacy is moved from one location to another the fee of $1 is in force but if a new pharmacy is opened the $200 fee is required The bill provides that evidence must be given to the Board of Pharmacy that the location of such a new store is necessary Heretofore the Board of Pharmacy issued registration certificates to ten or twelve new stores annually, since the new law has become effective only one store has been registered

Relative to the sale of liquor, anyone who desires to engage in its sale must show his fitness to the Board of Pharmacy, this evidence must also be submitted to the Liquor Control Commission, to a certain extent this also applies to the right of opening a new drug store The druggist's permit allows the use of alcoholic liquors for the compounding of prescriptions and for the manufacturing of U S P, N F and other medicinal preparations provided they are not to be used for beverage purposes, but it does permit, under regulations, the sale of alcoholic liquors in quantities of not more than 1 quart and prohibits the drinking of alcoholic liquors on the premises of any drug store It will be seen that proper distribution of drug stores rests largely with the Board of Pharmacy and the State Liquor Control Commission It will not be such an easy matter to open up a new pharmacy because of these restrictions and also because of the $200 tax for the opening of a new store No applicant who has been in serious conflict with Federal regulations will be eligible for a certificate

It was stated that copies of the Connecticut legislative program can be obtained by addressing Hugh P Beirne, chairman of the legislative committee of Connecticut Pharmaceutical Association, 615 Howard Ave , New Haven, Conn

R C Wilson said that an important question was involved in the report by Mr Beirne The beer question has brought about considerable discussion and trouble as to its sale in drug stores and this applies also to the sale of liquor

W H Rivard stated that as far as he knew, there was no other agency contemplated for the sale of any alcoholic liquors, excepting in drug stores

Ralph W Clark said there had been trouble with the beer question in Wisconsin Quite a few druggists want to sell beer and many are now selling bottled beer, but there is a provision of the law which provides that beer cannot be cooled in the place of sale The cigarette and cosmetic taxes were defeated There was considerable discussion over allowing assistant pharmacists to become fully registered pharmacists without examination It passed the Legislature but was vetoed by the Governor It is understood that the bill will come up again in the special session

Due to economic conditions the pharmaceutical experiment station was practically wiped out It was expected that the appropriations would be drastically cut but it was hoped that the

station could be kept up The hectic session of the Legislature brought out coöperation among the druggists that had not obtained before

Rhode Island —W Henry Rivard stated that no drastic legislation was passed in Rhode Island No sales tax was passed and the law regarding assistant pharmacists was strengthened Provision permitted assistant pharmacists to become fully registered, which after considerable difficulty was vetoed Such a measure is apt to come up again An effort is being made to increase the membership of the State association

John P Jelinek said that in Minnesota an effort was made to register pahrmacists without examination The Board of Pharmacy had a conference with the committees of both houses and compromised It was agreed that a special examination would be held and those passed would be registered pharmacists under the Act Two examinations were held and about 140 were passed

W H Rivard said that under the law of Rhode Island there can be no further registration of assistant pharmacists Provision has been made for students in the three-year course until 1936 and for professional men who have been in business since July 1931, to become registered until 1936 Anyone who has been in the drug business for ten years as assistant pharmacist may become a fully registered pharmacist without examination

South Carolina —J M Plaxco stated that in South Carolina all the nuisance taxes had been proposed The legislative committee spent the entire session killing two general sales taxes and one other was to give physicians the right to fill prescriptions on their own premises

Mrs Fayetta Philip said that many bills were introduced in California relating to pharmacy

R L Swain made a motion that this conference of the Section on Education and Legislation, the Conference of Law Enforcement Officials, and Pharmaceutical Secretaries be continued at future meetings This was seconded and unanimously carried

Secretary Kelly expressed his thanks to the officers and those who had prepared the program and his regret, because he had not been able to attend the entire meeting

On motion duly seconded and carried the meeting was adjourned

---

REPORT OF THE 11TH ANNUAL MEETING OF THE PLANT SCIENCE SEMINAR

BY F J BACON, SECRETARY TREASURER

The Plant Science Seminar held its 11th annual meeting in Madison, Wisconsin, at the Chi Omega House from August 21 to August 25, 1933 Chairman William B Day presided at the regular sessions According to the usual custom the program was divided into scientific sessions, field trips and special lectures on subjects of interest to pharmacognosists

After registration and a short business session the Seminar visited the University of Wisconsin Medicinal Plant Garden Dr W O Richtmann conducted the group over the garden and explained the development of the garden from the very modest beginning on the University campus to the present location on University Drive The plants cultivated and the methods of cultivation employed by the Garden were explained in detail

At eight o'clock Dr M E Diemer, Director of the Diemer Photographic Laboratories, gave a lecture on Wisconsin wild medicinal plants illustrated with colored lantern slides The specimens were photographed with color plates in their native habitats and the slides prepared in true color This beautiful presentation of familiar plants was greatly appreciated by the Seminar people

Mr Leroy D Edwards, of Western Reserve University, School of Pharmacy, presented a paper on "A Study of *Cimicifuga racemosa* (L) Nutt" The author discussed the methods employed in the treatment of the drug and the results obtained Sucrose was isolated from the drug No alkaloid was obtained

Dr Heber W Youngken presented the results of his latest work on Psyllium Seed Specimens of many varieties of Psyllium were discussed, and the histology and identification of the so called "Adex Psyllium' as the fruits of *Lallemantia royleana* Benth Dr Youngken illustrated his talk with specimens and drawings and pointed out the danger of using the Lallemantia fruits as a substitute for Psyllium Seed

Dr B V Christensen of the University of Florida College of Pharmacy, presented an illustrated lecture on the Planning and Development of a Medicinal Plant Garden Dr

Christensen showed pictures of many tropical and subtropical medicinal plants cultivated in Florida and discussed their cultivation

Dr Ralph Bienfang of the University of Oklahoma School of Pharmacy, discussed the system of arrangement of drugs taken up in their courses in Pharmacognosy

The Seminar visited the Forest Products Laboratory Tuesday afternoon Small groups were formed and conducted through the Laboratory by competent guides The various projects of the Laboratory were explained In the evening Mr J A Hall, Biochemist of Forest Products Laboratory, talked to us on Biogenetics in the Terpene Series "

The Wednesday morning session was held in the Pharmacognosy Department of the University of Wisconsin Dr W O Richtmann, Professor of Pharmacognosy, explained to us the results of many years' work on the ' Sources of Information on Crude Drugs "

Dr A H Uhl, of the University of Wisconsin Course in Pharmacy, presented a paper on the "Phytochemistry of Digger Pine "

Professor C J Zufall, Purdue University, presented the results of his work on Cardamom and suggested a method of assay for the seed

The afternoon was devoted to a boat ride on Lake Mendota A stop was made to inspect the garden of Dr and Mrs Diemer

Dr Karl Paul Link Professor of Biochemistry of the University of Wisconsin, lectured to the Seminar on Recent Research on the Chemistry of Gums and Pectin " Dr Link presented to the Seminar an extremely interesting and instructive talk on the structure and chemistry of the gums so widely used in Pharmacy

The Seminar spent all day Thursday in the field, visiting Blue Mounds, Tower Hill State Park and Taliesin Art Center directed by Frank Lloyd Wright Lunch, furnished by Eta Chapter of Rho Chi Society, was served at Tower Hill at one o'clock Many specimens of Wisconsin medicinal plants were collected in the Wisconsin river valley Dr Denniston, of the Botany Department of the University, acted as guide

The Friday morning session was held at the Chi Omega House and Professor F C Claus, of the Pittsburgh College of Pharmacy, presented reprints on "Poisonous Plants of Pennsylvania, ' prepared by Dr Darbaker

A classification of our native species of the genus Mentha was given by Dr F J Bacon of Western Reserve University School of Pharmacy

Dr Edward Kremers discussed the chemistry of mint oils and brought out the biogenesis of the compounds found in the mint oils

Professor Canis, of Rutgers University School of Pharmacy, presented a paper on the meaning of Pharmacognosy and discussed the method he uses to present his course

Chairman Day opened the business session at eleven o'clock and called for the election of officers The following were elected to conduct the business of the Seminar for 1934 *President*, F H Eby, *Vice-President*, L K Darbaker, *Executive Committee*, William B Day, C E Mollett, *Secretary-Treasurer*, F J Bacon

Dr and Mrs Kremers invited the Seminar to a picnic supper at their home ' The Highlands ' After an excellent lunch served on the lawn we were entertained around the campfire by Dr C E Brown, Curator of the Historical Museum Dr Brown told many interesting stories about Wisconsin Indians

The following members and guests attended the Seminar in Madison

C C Albers, University of Texas, Mrs C C Albers
F J Bacon, Western Reserve University, Mrs F J Bacon
Ralph Bienfang, University of Oklahoma
J B Burt, University of Nebraska, Mrs J B Burt
F S Bukey, University of Nebraska, Mrs F S Bukey
O P Canis, Rutgers University
P D Carpenter University of Illinois
B V Christensen, University of Florida, Mrs B V Christensen
E C Claus, Pittsburgh College of Pharmacy, Mrs E C Claus
R W Clark, University of Wisconsin, Mrs R W Clark

William B Day, University of Illinois, Mrs William B Day
L D Edwards Western Reserve University
W W Eggleston, Bureau of Plant Industry
F H Eby, Temple University, Mrs F H Eby
P A Foote University of Florida Mrs P A Foote
E N Gathercoal, University of Illinois, Mrs E N Gathercoal
Miss Katherine Graham, University of Wisconsin
E J Ireland, University of Wisconsin
R S Justice Ohio State University
Edward Kremers, University of Wisconsin, Mrs Edward Kremers
Miss Mary Langevin, University of Nebraska
W O Richtmann, University of Wisconsin, Mrs W O Richtmann
F J Slama University of Maryland Mrs F J Slama
A H Uhl University of Wisconsin
Miss Nellie Wakeman, University of Wisconsin
E H Wirth, University of Illinois
H W Youngken, Massachusetts College of Pharmacy
Sister Mary Francis Xavier University of Wisconsin
C J Zufall, Purdue University, Mrs C J Zufall

HOURS IN EUROPEAN PHARMACIES

The International Pharmaceutical Federation has investigated the hours of opening and closing of pharmacies The questionnaire was as follows (*a*) Are there any regulations relating to the closing of pharmacies? (*b*) Are these regulations of general provincial or local application? (*c*) Are these regulations issued by some competent authority, or by pharmaceutical organizations?

Among the replies received from twenty one countries, and published in the Bulletin de la Federation Internationale Pharmaceutique, are the following

Austria —There are no official regulations In Vienna pharmacies close at 7 00 P M and this closing hour, with slight variations, is general in Austria Evening and night duty is undertaken by rota In Vienna on every second Sunday pharmacies must close from 1 00 P M until Monday at 7 00 A M, without obligation to provide a night service Service for Sundays and holidays is officially regulated

Czechoslovakia —Pharmaceutical service must be given uninterruptedly, and is regulated by a law of 1908, augmented by orders of departmental authorities which are published in co operation with pharmaceutical organizations These regulations are based on an eight-hour working day Pharmacies are open from 8 00 A M to 7 00 P M —8 00 P M In places where there is only one pharmacy the pharmacist has the right (on authorization) to close from 12 M to 2 00 P M and may close on Sunday afternoon if he agrees to supply urgent medicines

Esthonia —There is a legal obligation for a pharmacist to supply medicines at any hours This is of general application In towns with several pharmacies night service is given by districts the rota being arranged by the Director of Pharmacies Opening hours are from 8 00 A M to 8 00 P M, and may close on Sunday afternoon if he agrees to supply urgent medicines

Finland —Closing hours are not regulated by law, but an order stipulates that pharmacies must give a day or night service if required By Par 14 of an order of December 17, 1928, the medical authorities can determine the hours of service

Greece —By a decree of the Ministry of National Economy and Police, pharmacies are to be open from 8 30 A M to 1 00 P M and from 3 00 P M to 8 30 P M to 1 00 P M and from 4 00 P M to 9 00 P M in March April, October, from 7 30 A M to 1 00 P M and from 4 00 P M to 9 00 P M in May, June, July, August September These regulations apply only to towns On Sundays about a quarter of the pharmacies are open

Switzerland —Regulations for closing and hours of service vary in different cantons In the majority of towns there is a regular night service as well as a Sunday service by rota In Zurich regulations have been drawn up by the pharmacists and accepted by the sanitary authorities

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1933–1934

Office of the Secretary, 2215 Constitution Ave , Washington, D C

December, 22, 1933

LETTER NO 5

To the Members of the Council

27 Sale and Exchange of Liberty Bonds Motion No 5 (Council Letter No 4, page 1302) has been carried Before the vote was received the called bonds had declined slightly in price as compared to the uncalled bonds The registered called bonds listed were sold at 101 and the uncalled coupon bonds to replace were purchased at 101 21/32 To illustrate, two $1000 registered bonds in the Endowment Fund brought $2018 net and two $1000 coupon bonds to replace cost $2035 13 net It was decided to sell the two $100 coupon bonds in the Headquarters Building Fund and the one $100 coupon bond in the Procter Monument Fund and not replace them The former brought $101 30/32 and the latter $101 14/32

In view of the difficulty of transferring registered bonds as further issues are called and as the coupon bonds bring a slightly better price, it seemed advisable to purchase coupon bonds

28 Election of Members Motion No 6 (Council Letter No 4, page 1304) has been carried and applicants numbered 10 to 56, inclusive, are declared elected

29 Contract for Printing and Mailing the Journal of the A Ph A for 1934 The following letter has been received from Chairman DuMez of the Committee on Publications

> "I have checked over the bids for publication of the JOURNAL obtained by Editor Eberle, very closely, and I am unable to discover how we would benefit by changing the publisher at this time
>
> ' Some of the estimates are very near that of the present publishers, but the expenses in making a change would more than make up the difference
>
> "Editor Eberle informs me that the service has been entirely satisfactory and I therefore recommend to the Council that the contract for publishing the JOURNAL for the coming year be renewed with the Mack Printing Company "

(*Motion No 7*) *It is moved by DuMez that the contract for printing and mailing the Journal for 1934 be awarded to the Mack Printing Company of Easton, Penna*

At the request of Chairman DuMez a vote is called for at this time but will be considered as tentative if there is objection

30 Budget for 1934 Chairman Swain of the Committee on Finance submits, in accordance with Article II of Chapter II of the By-Laws of the Council, the following report on appropriations and expenditures for 1933, with a suggested budget of receipts and appropriations for 1934, which were prepared by the secretary and approved by the chairman of the Finance Committee The officers and Finance Committee are fully aware of the difficult times we are going through, which have resulted in reduced receipts, and several items in the proposed budget have been again reduced, while others must be increased, the total being more than one thousand dollars less than for 1933

"To the appropriation for General Expenses in 1933 nothing has been added Of the appropriations only two have been exceeded to December first, and these are within the $50 limit for which Council action is not required They are the appropriations for the Scientific Section $27 41 against $25, and the Section on Historical Pharmacy $30 97 against $25 Every effort has been made to keep the expenses below the budget appropriations Charges to December 1st were $16,071 84 as against $21,580 appropriated

"Under the appropriations for open accounts to December 1st, the JOURNAL has cost $10,791 58 against the $11 000 appropriated, the N F $4008 68 against the $1800 and the Recipe Book $56 13 against the $500 No charges were made against the appropriation of $50 for Badges and Bars Charges to December 1st were $14,856 39 against the $13,350 appropriated

"To December 1st the total budget charges were $30,928 23 against appropriations of $34,930 for the year, so we will probably not exceed our total budget

"The receipts show considerable variation from the estimates From Dues, $7727 38 as compared to $8571 88 for the same period in 1932 Every effort has been made to hold this figure up, but many explain that they cannot afford the expense Bills for dues for 1934 were mailed on December 1st, and we cannot say what the total for the year will be From the JOURNAL $7271 15 as against $7862 54, which is very satisfactory under present conditions From the N F , $3954 36 for the year as against the estimate of $3500, which is very encouraging From the Recipe Book, $894 94 for the year against the estimate of $1500, which again shows a decided decline The receipts from interest on Headquarters Building Fund will be about $5000 as compared to the estimate of $4000 $1000 was received from the U S P Board of Trustees for the YEAR BOOK, and sales were $115 19

"It has been necessary to use the income from the Life Membership Fund for the year and to transfer $5000 of accumulated interest to the Current Fund "

BUDGET FOR 1934

It is very difficult to estimate receipts under present conditions The following is suggested

Interest	100 00	
Dues	$13,000 00	
Interest Life Membership Fund	4,500 00	
JOURNAL	9,500 00	
National Formulary	3,500 00	
Recipe Book	1,000 00	
YEAR BOOK	2,200 00	$33,800 00

APPROPRIATIONS FOR GENERAL EXPENSES

No	1	Salaries	$10 800 00
No	2	Maintenance of Building	1,800 00
No	3	Telegraph and Telephone	200 00
No	4	Clerical Expenses	1,600 00
No	5	Printing, Postage and Stationery	900 00
No	6	Office Supplies	150 00
No	7	Traveling Expenses	300 00
No	8	Premium on Bonds	50 00
No	9	Auditing	75 00
No	10	Certificates	50 00
No	11	Miscellaneous	200 00
No	12	Scientific Section	25 00
No	13	Section on Education and Legislation	25 00
No	14	Section on Practical Pharmacy and Dispensing	25 00
No	15	Section on Commercial Interests	25 00
No	16	Section on Historical Pharmacy	25 00
No	17	Commission on Proprietary Medicines	25 00
No	18	Committee on Local Branches	25 00
No	19	Committee on Membership	250 00
No	20	Committee on State and National Legislation	50 00
No	21	Committee on Syllabus	50 00
No	22	Committee on Pharmacy Week	250 00
No	23	Inter-Society Color Council	25 00
No	24	International Pharmaceutical Federation	120 00
No	25	Metric Association	10 00
No	26	American Conference on Hospital Service	25 00
No	27	Headquarters Building Campaign	500 00
No	28	YEAR BOOK	3,500 00
No	29	Library	50 00 $21,130 00

APPROPRIATIONS FOR OPEN ACCOUNTS

No 30	JOURNAL			
	(*a*) Publication	$9,500 00		
	(*b*) Clerical Expenses	1 000 00		
	(*c*) Postage and Stationery	300 00		
	(*d*) Freight, Drayage and Miscel	200 00	$11,000 00	
No 31	National Formulary		1,000 00	
No 32	Recipe Book		500 00	
No 33	Badges and Bars		50 00	$12,550 00
				$33,680 00

"With these reductions it will be necessary to further curtail expenses wherever possible The reductions suggested will interfere with the work of the ASSOCIATION but not seriously It will be necessary to keep the JOURNAL within the appropriation, which will mean abstracting or condensing many papers and articles, and to advance the extra charges for the completion of the revision of the N F It is impossible to even estimate at this time what the maintenance of the Building will cost "

(*Motion No 8*) *It is moved by Swain that the budget for 1934 be approved as submitted*

With the approval of the chairman of the Council a vote is called for at this time It will be considered as tentative if there is objection

31 Selection of Auditors The Chairman of the Committee on Finance recommends the employment of W A Johnson & Co Baltimore, Md , to audit the accounts of the ASSOCIATION for 1933, in accordance with Article 8 of Chapter IV of the By-Laws This Company has audited the accounts since 1922

(*Motion No 9*) *It is moved by Swain that W A Johnson & Co be employed to audit the accounts of the Association for 1933*

32 Applicants for Membership The following applications properly endorsed and accompanied by the first year's dues have been received

No 57, Fred C Allen, Marlinton, W Va , No 58, E W Bobst, Nutley, N J No 59, Paul M Rogers, 233 High St Morgantown, W Va , No 60, Richard T Buerstatte, Jr , Manitowoc, Wis , No 61, George E Crossen, College of Pharmacy, University of Minnesota, Minneapolis, Minn , No 62, Herman Emde, 5 Besselstr Konigsberg i/Pr , Germany, No 63, Marion D Falconer 223 E Alberta St , Anaheim, Cal , No 64, Maurice Goldman 3809 Waverly Ave East St Louis, Ill , No 65, Edgar E Goulet, 443 Lake Ave , Manchester, N H , No 66, Irvine Walter Grote, 2211 Union Ave , Chattanooga, Tenn , No 67, Jonathan Gordon, 377 Eastern Parkway Brooklyn, N Y , No 68, Ernest K Hoge, 1012 Main St , Wheeling W Va , No 69, John J Law, 468 Third Ave , West Haven, Conn , No 70, Alfred Rapps, 1010 E 2nd St , Plainfield, N J , No 71, Alfred Edward Rheineck, 2469 N 2nd St , Milwaukee, Wis , No 72 Eleanor Martha Uhlir Walnut, Neb , No 73, Melvin B Vogt, 3481 Fairmount Blvd Shaker Heights Ohio, No 74, William Vollmer, 330 W 42nd St New York, N Y

(*Motion No 10*) *Vote on applications for membership in the American Pharmaceutical Association*

33 The Headquarters Building The offices of the ASSOCIATION will be removed from 10 W Chase St , Baltimore, Md , to the Headquarters Building, 2215 Constitution Avenue, N W , Washington, D C , on or about January 1, 1934

The grading of the grounds was completed sometime ago The approach-steps are nearing completion and the roadway across the grounds in the rear of the building is completed The top-soiling is being done as well as part of the planting and seeding The remainder of the planting and seeding will be completed early in the spring

The grading, approach steps and roadway are being done by the George A Fuller Company, Washington, D C , and the top soiling, seeding and planting by the Westcott Nurseries, Falls Church, Va The Office of John Russell Pope is supervising all the work and Mr A F Brinckerhoff, New York, N Y , is the consulting landscape architect

A decision has been secured from the authorities of the District of Columbia that the building and grounds will be free from taxation after occupancy

E F KELLY, *Secretary*

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council" —Part of Chapter VI, Article VI of the By Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By Laws of this Association"

ARTICLE IV of Chapter VII reads 'Each local branch having not less than 50 dues-paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates"

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

BALTIMORE

The regular monthly meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson on January 3, 1934 President Solomon, in the chair called for reports of the various standing committees and for the secretary-treasurer's report for 1933

The secretary read the report for the past year and noted a marked improvement in the attendance The treasurer's report was then read The financial status of the Baltimore Branch is sound with a comfortable balance of over $200 on deposit The reports of the secretary treasurer were accepted

Dr Swain, chairman of the Committee on Legislation and Education, reported on the fate of the Uniform Narcotic Act in Maryland, the Liquor Bill, the N J Legislation on tolerances on prescriptions the Kansas Drug Store Registration Act, the Kentucky Pharmacy Act, the Drug Store Ownership Laws, and the new Federal Food and Drugs Act

B Olive Cole, chairman of the Membership Committee, reported that membership in the parent organization in Maryland has held up very well

Marvin J Andrews, chairman of the Committee on Science and Practice of Pharmacy, reported in detail the research work carried out in Baltimore at the Emerson Drug Company, the Department of Pharmacology of the School of Medicine, University of Maryland, the Maryland State Department of Health, Hynson, Westcott and Dunning, and the School of Pharmacy, University of Maryland

The secretary expressed the regrets of Editor Eberle, chairman of the Committee on Professional Relations, for not being able to attend the meeting and read the report of this committee

The committee reports were accepted as read

Mr Black, the first speaker of the evening, presented an interesting paper in which he stressed the importance of careful dispensing He further urged that a more friendly cooperation should be attempted between physicians and pharmacists

Mr Meyer, a retail pharmacist of many years' experience, presented an interesting demonstration and display of the many devices which he employs in his business to increase efficiency

Thanks were extended to the speakers President Solomon then called upon Mr Lowery of the Nominating Committee for a report The following were nominated and duly elected to office for the year of 1934 *President*, B Olive Cole, *Vice-President*, W F Reindollar, *Secretary-Treasurer*, C Jelleff Carr

After the installation of President Cole, Dr Swain presented a motion, which was carried, that the Branch present yearly another membership in the A PH A to a student in the School of

Pharmacy, University of Maryland, to be selected by the Faculty This membership was also to carry with it membership in the Baltimore Branch

After a few words about arrangements for the February meeting a motion for adjournment was passed

C JELLEFF CARR, *Secretary-Treasurer*

CINCINNATI

The last regular meeting of the Cincinnati Branch, A PH A, was held Tuesday night, January 9, 1934, at the Cincinnati College of Pharmacy

President Sondern introduced Dr Shiro Tashiro, professor of Biochemistry at the College of Medicine, University of Cincinnati Dr Tashiro spoke on, "Pharmacy in the Orient" This subject could well have borne another title as he explained in the beginning of his talk Dr Tashiro dwelt chiefly on the superstitious ideas, beliefs and odd remedies as he remembered them practiced in his native land years ago It was shown, however, that many of these odd remedies have since been exonerated by the teachings of modern science Proof of this was amply given in his examples of the school boy, the chewing of water, the death of the town barber, etc In 1895 Dr Tashiro's village felt the influence of the Occident From that time on Science became the God of the people and the West their ideal

Dr Tashiro was given a standing vote of thanks

The minutes of the previous meeting were read and approved

The report of the Committee on Pharmaceutical Jurisprudence was submitted by Mr Freericks He told of a proposed amendment to the Food and Drugs Act written by Dr Beal This contains some very desirable features, particularly that dealing with a partial disclosure of formulas of a toxic nature Dr Copeland, he reported, is also rewriting his proposals Mr Freericks requested that in order to make better reports on this committee the members ask specific questions

The report of the Publicity Committee was given by Mr Henke All papers were notified of this meeting and one gave generous space to the details of Dr Tashiro's speech

Mr Cassidy reported for the Drug Products Committee This committee will report on new products on the market and investigate and report on those of dubious nature Mr Cassidy reported on the new British product of Pure Vitamin C in crystal form A detailed report on this product will be given at the next meeting

A motion was made, seconded and passed that the Branch appoint an historian

The secretary will endeavor to get more space in the JOURNAL for the reports of our meetings

Mr Jennie in behalf of the O V D A invited all members to attend the installation of officers of the organization at the Netherland Plaza, January 30, 1934

The meeting adjourned and all members partook of refreshments ably handled by the Refreshment Committee

R L PULS, *Secretary*

DETROIT

The meeting of the Detroit Branch, AMERICAN PHARMACEUTICAL ASSOCIATION, was held on the evening of December 21st at Webster Hall Due to the absence of the chairman, Henry Tyszka presided Secretary Bialk was absent on account of illness and Prof Charles H Stocking acted as secretary *pro tem* The minutes of the November meeting were read and approved

Secretary S R Klegan of the Detroit Registered Pharmacists' Association explained the purpose and aims of the organization In part, he said, "The purpose of the drug clerks' organization is not to hold a club over the heads of the proprietors to compel the payment of higher wages, but rather to work with the proprietors in an effort to assist them to make larger profits so that the payment of higher salaries will become possible He further stated that the new organization came into existence because the clerks did not feel that they could secure the desired results through active membership in the Detroit Branch, A PH A as it attracts into its ranks only the best element in pharmacy and therefore efforts to bring influence to bear upon the less desirable members of the profession would be lost"

Mr Klegan stated that the members of the Registered Pharmacists' Association do not expect to dictate to their employers nor to use the labor union methods to achieve their aims He was of the opinion, however, that much good could come to clerks and proprietors through the activities of the association

L A Seltzer contended that the proprietors have serious problems of their own and that in no business is the interest of the clerk and that of the proprietor so closely related as in pharmacy He thought that closer cooperation between the clerks and the proprietors could be best worked out through the medium of the friendly exchange of ideas in an organization such as the Detroit Branch, where both classes meet on an equal footing This opinion was shared by James Liddell, who stated that the clerks profit by the experience of the older members

Dean R T Lakey complimented the new organization on the initiative shown by the membership in attacking the problems of the clerks and stated that he felt much good could be accomplished He contended that because of the large number of clerks, compared with the number of drug store owners in the state, great power lies dormant in the hands of the clerks

The meeting was well attended, considering the fact that it was scheduled so close to the holiday season

CHARLES H STOCKING, *Acting Secretary*

NEW YORK

The December meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in the Brooklyn College of Pharmacy, Long Island University, on December 11, 1933 There were about sixty members and guests present

Vice President Ballard was in the chair and he expressed the regrets of Dr Bilhuber for his inability to attend The report of the secretary was read and accepted

Chairman Lehman, of the Education and Legislation Committee, reported three points of importance,

First The NRA Retail Code is unsatisfactory Considerable difficulty is being experienced with the definition for cost of merchandise

Second The Tugwell Bill Objection is being raised to the 'one man rule'

Third Passing of prohibition, Mr Lehman called attention to the fact that a physician's prescription is still necessary in the sale of liquor in a drug store The sale of alcohol is prohibited

Chairman Kassner, of the Membership Committee, reported Mr Bragger, a new member for the Association

Dr Arny reported on the organization meeting of the Northern New Jersey Branch of the A PH A

Vice-President Ballard appointed a nominating committee to report at the next meeting *Chairman*, Hugo H Schaefer, R A Lehman and Reginald Dyer

Dr Ballard then called upon Mr Heimerzheim to say a few words regarding Dr Joseph L Mayer, whose untimely death had occurred but a few days before the meeting Mr Heimerzheim spoke of Dr Mayer as a classmate and friend, and called attention to the sincere and faithful service performed by Dr Mayer in his work in the Brooklyn College of Pharmacy

Members and guests were asked to rise and stand in silent tribute to a beloved member

Chairman Heimerzheim, of the Committee on the Progress of Pharmacy, then reported the following

1 Investigations have shown that the rate of deterioration in aqueous solutions of gallotannic acid preserved at a temperature of 60° to 65° F is negligible over a period of six months

2 The modern treatment of strychnine poisoning consists chiefly and preeminently in the intravenous administration of sodium amytal

3 Alkali stannites are now being used as active ingredients in preparing depilatories

Dr Ballard then introduced the speaker for the evening, Dr Ralph Holt Cheney, who spoke on the "Relation of Caffeine and Coffee to Human Efficiency" (To be published in a succeeding number of the JOURNAL)

At the close of Dr Cheney's address there was some discussion, and after the speaker had answered numerous questions the meeting adjourned RUDOLF O HAUCK *Secretary*

NORTHERN NEW JERSEY

The fourth regular meeting of the Northern New Jersey Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was called to order by President Little on December 18th

After a brief word of greeting to the many visitors by the president, our first two new members, Doctor L K Riggs and Professor W L Sampson, were introduced, and the fourteen persons whose names follow were nominated for membership in the branch and elected They are Hyman Aberbach, Philip Basson, Annabel Beaty, John J DeBus, John G Graef, Albert Hawes Milton Kahn, George Lordi, O H Florenzie, Abram Mosler, Janette B Osofsky, W H Owens Alfred Rapps and Robert Wuensch

A special occasion was made in the subsequent program of the association for the election of Dr R L Swain to honorary membership The branch is very proud to have as its first honorary member the president of the parent body

One of the most interesting reports of the evening was that presented by Mr Mecca, speaking for the Professional Relations Committee He outlined plans for two joint meetings to be held in the early spring, one with the physicians, and the other with the dentists Features at both programs will be combined lectures and demonstrations on things pharmaceutical which will be of considerable interest to our professional friends

Professor Cox, reporting for the Committee on Science and Practice of Pharmacy discussed some of the recent advances in manufacturing, the desirability of state boards being more careful about the character of licensed pharmacists, the future of liquor in drug stores, the work of the New York State Board in analyzing samples of merchandise purchased at cut rate drug shops, and Judge Pound's decision that Pharmacy is a profession, analogous from a training standpoint with law and medicine

At the completion of the regular order of business President Little introduced Mr Vail, of Becton, Dickinson & Company who gave us a very nice prologue to the instructional entertainment his company was presenting as the feature of the evening This was to be a lecture and bench demonstration on the manufacture and use of clinical thermometers

When Mr Vail had concluded his talk W G Meriam began the lecture with the story of the development of the thermometer from the first crude instrument of Galileo to the precision clinical thermometer of to day As he began discussing the bench work involved in the making of thermometers, Hugo Barthen, his assistant, carried out each delicate operation while it was being explained The intricacies of the manufacturing processes were most capably demonstrated After the formal talk the meeting was adjourned and we were permitted to gather around the work bench where both Mr Barthen and Mr Meriam were kept busy with repeated demonstrations and the answering of questions L W RISING, *Secretary*

NORTHERN OHIO

The Northern Ohio Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION met January 12, 1934, at the Faculty Club of Western Reserve University, twenty-two members were present

After installation of officers for the new year (the names of the new officers are listed in the roster of the A PH A, Local Branches of THIS JOURNAL) the time of the meeting was taken up with the discussion of a newly adopted method for contacting the 1400 physicians whose names appear on the roster of the Cleveland Academy of Medicine Hereafter bulletins of a general nature only will go directly to physicians, while members of the Academy of Pharmacy will be supplied with sufficient type prescription cards and information that will be serviceable when the physicians of their neighborhood are detailed or contacted

PHILADELPHIA

The December meeting of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Philadelphia College of Pharmacy and Science on Tuesday evening, December 12, 1933

The meeting was called to order by President Eby, who notified the assembly of the recent death of Mr Joseph W England, president of the Branch in 1921, and appointed Dr LaWall and Dr Krusen as a Committee to draw up a resolution of sympathy to be presented by the Phila-

delphia Branch to the family of the deceased Dr LaWall recalled phases of Mr England's life bearing on the advancement of American Pharmacy

Ivor Griffith, speaker of the evening, Associate Professor of Pharmacy at the College, Director of Research at the Stetson Laboratories and Editor of the *American Journal of Pharmacy*, was then introduced to present the topic "Dyes and Disease"

He began with a history of the use of dyes therapeutically, giving his version of the discovery of the famous "Perkin's Purple" in 1856 during the search for a synthetic quinine With a lecture table experiment he then produced a quantity of the 'Perkin's Purple"

Professor Griffith stated that the dyestuffs commonly used in medicine were mostly toxic, especially the basic dyes, and that in dilute solutions they were antiseptic Reduction of surface tension was suggested as a topic of research in the medicinal use of dyes The textile industry has developed certain detergents which reduce the surface tension of the dye bath, thus permitting greater penetration The therapeutic value of many dyes could be greatly enhanced if the surface tensions of their solutions might be reduced To be of value in the treatment of disease a dye should persist in the tissue until its work is accomplished, and then disappear Mention was made where overdoses of certain dyes produced startling results and changes in the appearance of the patient

Professor Griffith confined his talk mainly to a discussion of the chemical dyes of the basic and fluorescein groups With regard to the recent use of methylene blue as an antidote in carbon monoxide and cyanide poisoning, he said that it was now supposed that the dye occupied the place of the oxidizing enzyme in the blood, until recovery enabled the enzyme to again function properly

The lecture was accompanied by a series of practical experiments illustrating the properties of the dyes mentioned Charts were displayed, one showing 22 possible colors obtainable by combining three dyestuffs of cardinal colors The new 1934 color chart displayed the 80 colors to be used by clothing manufacturers during the coming year and Professor Griffith said that to date about 1500 color shades were on record

At the close of the lecture Dr LaWall commented on the use of dyes in food coloring, and said that vegetable colors were not the only ones suitable, and that many synthetic dyes could be used satisfactorily

Dr Munch made some interesting comments on the poisonous effects of certain dyes that have been used as food colors Dr Bird announced the possession of a sample of the original mauve, so popular in England after its discovery, and offered to share his sample with the College Museum This offer was accepted on behalf of the curator by Dr LaWall

The meeting adjourned at 9 45 with a rising vote of thanks to the speaker

E H MacLaughlin, *Secretary*

PITTSBURGH

A meeting of the Pittsburgh Branch of the American Pharmaceutical Association was held Tuesday evening, January 16 1934, in the main lecture room of the Falk Clinic at 3601 Fifth Ave

PROGRAM

"Exhibition of X-ray and Fluoroscopic Technique," Mr John Russell, Falk Clinic 7 30 to 8 30 P M

A discussion of Mouth Antiseptics and Dentifrices," W Harry Archer, D D S, Dental School, U of Pittsburgh

' Analgesics, Anodynes and Sedatives Used in Dentistry," W Paul Walker, D D S, Dental School, U of Pittsburgh

---

Wilbur L Scoville, for many years member of the technical staff of Parke, Davis & Co, well and favorably known for his work in the advancement of pharmacy, is on the retired list Mr and Mrs Scoville are now in Florida No doubt Professor Scoville's activities for pharmacy, especially in the revisions of the U S P and N F, will long continue Best wishes for health and happiness are extended

SYMPOSIUM ON PRACTICING PROFESSIONAL PHARMACY *

How Hospitals Can Profit by Adopting a Formulary and Chart and Engaging the Services of a Registered Pharmacist

BY HARRY E. BISCHOFF

There are generally four types of Hospitals

1st—Municipal

2nd—Those partly supported by municipal appropriations

3rd—Incorporated institutions financed by endowment by religious or civic organizations or by individual support

4th—Private Hospitals

The second and third types are greater in number as they embrace all hospitals operating under the auspices of religious and civic organizations. Even in big cities where there are City Hospitals, there are usually a number of these privately or semi-privately operated hospitals which as a whole, render far more service than the city institution.

To install a pharmacy or a pharmaceutical laboratory in a hospital where none has operated, it first becomes necessary to persuade the governing body that it will save the institution money. This is preferably accomplished through the Superintendent or Medical Director or whoever may be the directing head. The plan should be referred to the Medical Staff and a committee appointed, representing all departments of the hospital and including a trained pharmacist. A competent pharmacist, through his familiarity with ethical medicines and official titles and costs of drugs, can be of much assistance in preparing a suitable Formulary and in advising upon the available standard medicines and their price in comparison with the many specialties. The pharmacist necessarily must be conversant with medical terms, action of drugs, types of medication and, principally, comparative costs of proprietary and official preparations. He must drive home the point that all standards for drugs and medicines are defined in the U. S. P. and N. F., and manufacturing firms have only one recourse and that is to buy their supplies through the same sources that pharmacists do, hence fancy names naturally command fancy prices. To put into effect the prescribing for U. S. P. and N. F. drugs and preparations in lieu of proprietaries, a Hospital Formulary and Chart are needed to properly carry out the plan since without them the staff has no guidance.

To win the support of the Medical Staff, first of all their pharmaceutical needs should be taken into consideration as they generally have some pet formula. How to thought of teaching the internes the art of prescribing is the next feature. This will be one of the duties of the staff in rounding out the experience and practice that internes must necessarily obtain in hospitals. Most State Boards demand at least one year of rotating service in Class A Hospital as a requisite before taking state examinations and the Formulary in this way aids as a course in Materia Medica and the allied subjects that they are examined in. Hospital Staffs are just as zealous of the records of their internes taking state examinations as are the Schools of Pharmacy. The Staffs of hospitals watch more closely the results of state examinations regarding their internes than they do the schools from which they graduate.

The Hospital Formulary should be published in a practical manner in order that it can be readily referred to.

In addition to the printed Formulary the formulas are also printed on a chart. This is put up in all wards, clinics and at each floor supervisor's station and can readily be referred to by those on service, should they be without their Formulary, which is of pocket size. As a matter of fact, the charts are referred to more frequently than are the books. The books are generally perused leisurely at the office of the practitioner or by the internes during rest periods. This also encourages the practitioner to prescribe U. S. P. and N. F. preparations in his regular practice and is far reaching in its influence. As for the interne, it is the means of educating him to prescribe other than proprietary preparations and when he opens his office, he is not so likely to write for the many specialties which are ordinarily found on his prescriptions.

---

* See page 1021, October JOURNAL, and page 1279, December issue

The nurse, also profits immensely by knowing the chart as it affords her the opportunity to study the medicinal terms and greatly aids her with her materia medica

Most hospitals to day are endeavoring to make each department carry itself from a stand point of costs, and it is a known fact that the Pathology department and the X-ray department show a profit often in sufficient amount to carry their clinics

The drug department at the North Hudson Hospital also provides an income, for as each patient is billed for a laboratory charge (this work is compulsory by a ruling of the American College of Surgeons in order to attain a class 'A" rating) and for X ray work, if the same is neces sary, so are they billed for medication, whether they be ward or private patient If ward patients—at a minimum charge, just sufficient in amount to cover costs, if private—at usual prescription rates Of course if a flat rate is given for ward patients, including all costs, neverthe less, the work done in the pharmacy is billed to the office and the pharmacy credited, just as they bill and receive credit for private work At the North Hudson Hospital prescriptions are billed for both ward and private patients under one listing In order that this may be properly summed up, the important facts are as follows this Hospital, a general hospital of 160 beds 2 operating rooms, doing all types of work (except handling contagious diseases), has day and night ambulance service and 11 different types of clinics, and giving medical and surgical service The pharmacy only handles drugs and medicines The control of gauze, cotton, etc , is under another depart ment, whereas, some hospitals include these with their drug department All chemicals, phar maceuticals, drugs, etc , such as disinfectants, etc , are charged to the institution as a whole, whether it be a general laxative or anything else—at cost price

For comparative purposes, the records of 1931–1932 speak for themselves

	1931	1932	Increase
Prescription Account	$4050 69	$5133 65	$1082 96
House Account	3847 15	3714 66	—132 49
	$7897 84	$8848 31	$ 950 47

You will note that the House Account was slightly less in 1932 than in 1931 and this was, principally, because prices were lower as the amount of materials used was greater in quantity The largest items in the House Account are principally for disinfectants and germicidal agents such as Liquor Cresolis Compositus, Liquor Soda Chlorinata and Liquor Formaldehyde, etc , for washing floors, etc

Bearing in mind the fact that costs were much higher in 1931 than 1932, the above figures prove that the Staff favors this service more than ever and appreciates the fact that U S P and N F preparations meet all medical needs because there are no "patents" or "proprietaries" whatsoever in our drug department

This year to date, notwithstanding the times and costs, the Drug Department is showing even a greater income Of course, the wards are overflowing and private rooms are now usually occupied by ward patients at ward rates, which also means medication at cost

The cost of installing our Pharmacy fully equipped, which replaces our former drug room, was accomplished at a cost of less than $900 This includes everything—carpenter work for making of the counter, drawers, shelves and closets, plumbing work of replacing a small sink with a large deep sink with a single unit for hot and cold water faucet with foot control, large enough to wash and clean five gallon containers, electrical work of installing 4 outlets for lights and gas connections for 2 burners The balance was spent on utensils, bottles, jars, spatulas, scales weights, mortars and pestles, pill machine, graduates, etc The stock bottles for galenicals, etc , costs were nil because these were collected over a period of time and we painted the names and numbers on them with white enamel which permits washing and keeps for about three to four years, even under constant usage This not only kept down the costs but is also far more satisfac tory than paper labels, and superior to glass labels, which crack and break These containers can be readily washed and kept cleaner, and the labels are more durable When I say fully equipped, I mean just that, since this figure includes stock of galenicals, chemicals, drugs, etc , for about four to five months' supply Some, of course, last longer, while others are continually being reordered

We have a full-time pharmacist who works from 9 00 A M to 5 00 P M and two nights a

week from 7 00 to 8 30 o'clock Sundays and holidays he is on from 9 00 A M until 12 00 A M He has the assistance of a clinic nurse when necessary, and the cleaning is done by a porter

The cost of materials and supplies for 1931 were $1769 19 and for 1932 they were $1235 37 There were some additional interlocking items that partly belonged to the drug department but because they were principally for the pathology or other departments, they were charged elsewhere At the most, they wouldn't amount to more than $200 during any year

These facts presented show that a drug department can produce equally as much revenue as the Pathology or X-ray departments of hospitals, if properly handled The profit for 1931 was approximately $4208 65 and for 1932 it was $4672 94, against which should be charged space consumed, light, heat, water, insurance and depreciation

If an attending physician wishes to prescribe a proprietary for a private patient, that is his privilege, it is procured elsewhere However, for ward and clinic cases, the Staff is subject to rules and must confine its prescriptions to official drugs or preparations At first this was an effort, but after they found that they obtained results from official preparations, the battle was won I clearly proved the efficiency of many official drugs, but the most outstanding was that of Digitalis, which is used as much as any drug in a hospital Most physicians have a favorite proprietary Digitalis preparation, so the opportunity to demonstrate the action of a standardized Powdered Digitalis was easily accomplished with wonderful results and much satisfaction They also like to change their vehicles and they are now using some that they never before knew were official, such as Syrupus Cacao, Syrupus Idei, etc

The Internes particularly appreciate the Formulary as it affords them every opportunity to prescribe They also use the same for reference purposes as to action of drugs

The Nurses are also pleased because they use the Formulary in their studies

Since it is one of the functions of a Superintendent to keep down costs, it is not necessary to elaborate on his reactions but I briefly want to say that the Superintendent once said in his monthly report ' The installing of our new drug department not only permits our Staff and Internes to practice better medicine but also has been the means of lowering costs " Our drug bills now prove to be $200 less a month than heretofore

After having this Formulary copyrighted, more than 50 requests were received from different hospitals throughout the country but particularly from the northern section, east of Chicago I have in most instances forwarded a copy, also a Chart, and in a few cases have permitted them to make copies of the Chart, hoping that it would be the means of creating positions for Pharmacists, and of impressing the American College of Surgeons and the American Medical Association with the importance of including a Pharmacist with their other requisites for a Class "A" rating for hospitals

---

PILLS AND TABLETS FOR INTESTINAL MEDICATION

Drugs that have to pass through the stomach unchanged, but which must dissolve readily in the intestinal secretions have in the past been coated with keratin or acted upon by formaldehyde Cellulose esters and ethers have also been suggested, but they are unsuitable in the pure state They are rendered suitable by a newly patented process, which consists of embedding particles of a substance more easily attacked by intestinal ferments in cellulose ester substance Examples of embedding materials are fats, oils, waxes, lipoids and bile acids When added to a cellulose ester or ether the latter becomes readily soluble in intestinal ferments For example, the drug mixture may first be mixed with the pill forming substance or filler, and then the pills are dipped into a solution consisting of equal parts of 5 per cent nitrocellulose and 5 per cent olive oil in an alcohol-ether mixture A rapidly hardening skin is obtained over the pills The pills may be coated with a thin sugar-gelatin layer and then dipped into a solution of 5 per cent cellulose acetate and 5 per cent castor oil in acetone Capsules may also be made from a mixture of 5 per cent nitrocellulose and 5 per cent lecithin dissolved in equal parts of alcohol and ether The capsules are then filled with the drug They will not dissolve in the stomach, but will readily dissolve in the intestines —(*Drug and Cosmetic Industry*, 4 (1933), 471)

EDITORIAL NOTES

Because of removal from Baltimore to Washington, of Association Reports, which required many pages, publication of a number of papers and items in this Section had to be deferred We hope to have the work properly adjusted for the next issue of the JOURNAL

THE BRITISH PHARMACOPŒIA

The Pharmacopœia Committee (British) of the General Medical Council reports that the Pharmacopœia Commission took office on October 1, 1933, and since then have held two meetings They have arranged the allocation of the work of revision among the members of the Commission, and have drawn up a provisional scheme for the formation of Sub Committees to conduct investigation and inquiry on special subjects germane to Pharmacopœia revision They have under consideration a proposal for the preparation of an Addendum to the British Pharmacopœia 1932, which shall include any changes in the standards of the British Pharmacopœia 1932 which may, after due consideration, be thought necessary, together with monographs on such new drugs as may be considered suitable for official description

The Commission now has its own research laboratory The total number sold of copies of the recent revision of the British Pharmacopœia is 33,095, *i e*, according to the last report we have seen, which number is doubtless, much larger by this time

MEMORIAL TO HENRY GEORGE GREENISH

The Council of the British Pharmaceutical Society of the School of Pharmacy Students' Association have formed a committee to decide upon and raise a fund for a memorial to the late Henry George Greenish, which will be in addition to the formal memorial to be set up by the Council

Professor Greenish was a member of the Society's School of Pharmacy for about 50 years and active in all British pharmaceutical affairs He was an honorary member of the AMERICAN PHARMACEUTICAL ASSOCIATION (see Obituary, page 925, volume XXII) Subscriptions may be sent to the Joint Honorary Treasurer, 17 Bloomsbury Square, remittances are to be made payable to the Greenish Memorial Appeal Committee

PLAQUE OF DR LONG PRESENTED TO MURPHY MEMORIAL

The Fellows of the American College of Surgeons living in Georgia presented a bronze plaque bearing the likeness of the late Dr Crawford Williamson Long, discoverer of ether anesthesia, to the John B Murphy Memorial Building, Chicago, Ill The plaque, which reposes in a niche in that building, was appropriately unveiled before the Clinical Congress of the American College of Surgeons

VANCOUVER DRUGGISTS UTILIZE DRUG STORE SURVEY REPORT

At a recent meeting of retail druggists of Vancouver, B C, it was announced that the executive committee had mailed to all members a bulletin entitled, "Druggists Show Wide Variance in Pricing Prescriptions' The bulk of the text of this bulletin was based on a report evolved from the national drug store survey entitled "The Professional Pharmacy" The Canadian association closed the bulletin by stating that druggists would profit by following the suggestions dealing with prescription prices Reprints of "The Professional Pharmacy" (price 25 cents) are being prepared and may be obtained from the AMERICAN PHARMACEUTICAL ASSOCIATION, 2215 Constitution Ave, Washington, D C

TREATMENT OF NARCOTIC DRUG ADDICTS AT FEDERAL NARCOTIC FARMS

A new experiment in the treatment of drug addicts will be made possible when the Federal narcotic farms at Lexington, Ky, and Fort Worth, Tex, now under construction, are completed and the 1800 drug addicts in Federal prisons are transferred to them

Under the supervision of the Public Health Service, it is planned to develop these institutions as research centers for the treatment of addicts An advantage which they will have over private institutions of a similar nature, it is pointed out by officials of the Service, is that any program decided upon can be enforced upon those receiving treatment

The Service finds that the cause of narcotic drug addiction are of three types Approximately 70 per cent of the present day addicts took up the use of narcotic because of contacts with other addicts, chronic and painful illness was responsible for about 25 per cent and the remaining 5 per cent are due to other causes curiosity, fatigue and the like

Mental attitude and a predisposition toward use of drugs are responsible for about three fourths of present day addiction according to the Service

The Service concludes that various experiences indicate that a narcotic addict with a normal mental background will not long continue as an addict for narcotics are unnecessary for the comfort of one who enjoys good mental health

AGAR EMULSION OF HEAVY LIQUID PETROLATUM

Heavy Liquid Petrolatum	[illegible] cc
Agar	[illegible] Gm
Sucrose	100 Gm
Acacia, in fine powder	60 Gm
Tragacanth, in fine powder	10 Gm
Tincture of Vanilla	[illegible] cc
Tincture of Lemon	[illegible] cc
Oil of Cassia	0.5 cc

Water, a sufficient quantity to make 1000 cc

Dissolve the agar and sucrose in 300 cc of boiling water, and strain the liquid through gauze into a suitable vessel Set aside until it is cool but not jellied Incorporate the powdered gums in a capacious mortar with the heavy liquid petrolatum Then gradually add the agar solution, thoroughly mixing the liquids with the aid of an egg beater Finally add the tinctures and oil of cassia and sufficient water to make the product measure 1000 cc — A PH A Recipe Book," page 197

TWO NEW JERSEY LAWS

Robert P Fischelis comments on two New Jersey laws in the following

The New Jersey hypnotic drug law represents the first attempt on the part of any state to limit the dispensing of drugs and preparations containing barbital, chloral hydrate, paraldehyde, sulphonal, trional, tetronal, carbromal and chlorbutanol to prescriptions of physicians, dentists or veterinarians One of the effects of this law is to automatically curtail the sale of these products in stores which do not have a prescription department operated or managed by a Registered Pharmacist

The prescription law definitely establishes a routine for compounding, recording, filing and dispensing prescriptions It will be noted that the regulations prescribe the equipment and apparatus required or the establishment of a prescription department and it is authorized under the law to establish tolerances for prescription work This is the first time that a Board of Pharmacy has been authorized to make regulations for the establishment of tolerances to allow for deviations from the amounts of ingredients prescribed, due to manipulative procedures and deterioration Dr Fischelis states that this prescription law and the regulations will go a great distance toward safeguarding the compounding of prescriptions and restricting it to properly qualified pharmacists

NRA PREPARES TO ORGANIZE INDUSTRY FOR ADMINISTERING OF APPROVED CODES

The Washington correspondent of the *Oil, Paint and Drug Reporter* states that plans for transforming the National Recovery Administration and the trade associations operating under it from code drafting organizations into code administering organizations have been virtually completed and will be announced in tentative form within a few days

Following this a general congress of all code authorities, 150 or more, will be called in Washington probably about February 15th This group will discuss with Administrator Hugh S Johnson and his staff the many problems involved in operating under an approved code Formal promulgation of rules governing code authorities will not be made until after this gathering

Meanwhile, the NRA is giving properly organized code authorities the temporary power to handle trade practice violations and complaints Permanent plans, however, call for retaining enforcement powers in the hands of the government

LOS ANGELES FLOOD

The California flood caused large property loss and damage, especially in the Montrose-Glendale section of the Los Angeles suburbs Comparatively small loss was sustained by the druggists, but to their credit good service was rendered by the pharmacists in serving others with first aid and medicines

NEBRASKA ASSOCIATION

The 53rd annual convention of the Nebrasl a Pharmaceutical Association will be held at Omaha, May 7th–9th, with headquarters at the Paxton Hotel The date of the convention is one month earlier than that of previous years

GOLDEN ANNIVERSARY MINNESOTA PHARMACEUTICAL ASSOCIATION

Minnesota will celebrate for nearly a week, commemorating the fiftieth anniversary of its organization Tuesday February 13th—addresses will be made by Mayor Bainbridge, President Elect of Montevideo, Theodore A Arneson, O P Cleaver, who had a large part in arranging the lighting effects at A Century of Progress Opening of the Drug Show by President J P Jelinek Banquet

Wednesday—Scientific and Practical Section Northwestern Branch, A Ph A under direction of Dean Wulling President's reception and ball

Thursday—District Meetings, banquet

Friday—Conclave of Veteran Druggists social gatherings and various district meetings —Hugo O Peterson is chairman of the Committee on Arrangements

PERSONAL AND NEWS ITEMS

Dr George Barger—well and favorably known for "high excellence in the prosecution or promotion of original research in the Chemistry and Natural History of Drugs"—has been awarded the Hanbury Medal Dr Barger is author of 'Ergot and Ergotism," he is a member of the faculty of Edinburgh University

The University of Paris has conferred the Doctor's degree on **Prof L Van Itallie**, University of Leyden He is an honorary member of the AMERICAN PHARMACEUTICAL ASSOCIATION Dr Van Itallie is president of the technical commission of the League of Nations for the standardization of the analysis of opium, he is professor of toxicology and pharmaceutical chemistry, University of Leyden

Dr John Jacob Abel, in his presidential address before the American Association for the Advancement of Science, included the following striking statements

"We ourselves are walking drug shops An experienced chemist or pharmacist would have no difficulty in preparing arrow poisons from some of our own organs that would have delighted the heart of primitive man I incline to the belief that no living cell exists whose contents or metabolites are not toxic to some other living cell"

Prof Heber W Youngken, of the faculty of the Massachusetts College of Pharmacy, presented two papers during the convention of the American Association for the Advancement of Science held in Boston The first of these was entitled An Investigation of the Viburnums and Their Medical Aspects' which was given before the Section on Medical Sciences, at the Boston Medical Library on Friday, December 29th The second, delivered before the General Section of the Botanical Society of America, at Mallinckrodt Hall Harvard University, on December 30th, was entitled A Comparative Study of the Seeds and Spikes of Certain Caulescent Species of Plantago" Both papers were illustrated with the lantern

Prof Marston T Bogert, head of the department of organic chemistry at Columbia University, has been appointed a member of the Board of Directors of the Florida Research Institute, whose headquarters are at Eustis, Florida

Colonel Samuel Price Wetherill, Jr, president of the Philadelphia Art Alliance and member of the executive committee and former president of the Tri-State Regional Planning Federation was elected chairman of the Board of Trustees of the Philadelphia College of Pharmacy and Science at a meeting of the trustees January 9th He succeeds Joseph W England who had been chairman from 1924 until his death December 2nd He is the great great nephew of Samuel Price Wetherill who was the presiding officer at the meetings of the Philadelphia College when it was organized in Carpenter's Hall, Philadelphia, in 1821

Dr R L Swain was speaker at the meeting of the Maryland Academy of Medicine and Surgery on January 15th The address was under the auspices of the U S P and N F Publicity Committee—the subject of Dr Swain was "The U S P and N F—Their Relationship to the Costs of Medical Care"

Ambrose Hunsberger has resigned as member of the N A R D executive committee

Governor Albert C Ritchie, of Maryland, in an address said

'A great many people of whom I happen to be one, still believe that the business stability of this nation depends upon the self-reliance

and initiative, the energy and unfettered industry of independent men and that our national happiness and prosperity will not survive if the independent merchant—the grocery store, the drug store, the retail store, the corner store and the neighborhood store—are overwhelmed by mass wealth and by giant size and power"

Prof Karl Sudhoff, formerly of the University of Leipzig, where he held the chair of History of Medicine celebrated his 80th birthday, November 26th Lately, he has devoted his chief energies to research on Paracelsus, whose medical writing he is publishing in an imposing edition

John O'Brien, Omaha pharmacist Pharmacy Week prize winner of 1932, has developed the professional side of his drug store—the returns from prescriptions represent 50% of the total volume of the gross income *The soda fountain* is Mr O'Brien's hobby and represents one-third of the total sales volume

E V Lynn spoke before Phi Sigma, Washington State University, at its recent meeting on "Biology in Relation to Drugs"

Dean C W Johnson, who became seriously ill on the train bound for the Madison A PH A meeting, has taken up his work as dean and on the faculty

G H P Lichthardt is now connected with California Department of Public Works (Research Department) He, recently spoke to the students of the University of California on the opportunities of trained pharmacists in non pharmaceutical occupations

Anton Hogstad, chairman of National Week Committee, writes that within the next five years there will be a marked change in American Pharmacy He is convinced that the trend of pharmacy is definitely toward a revival of the professional in pharmacy He holds that many important factors should be receiving attention—professional window displays, personal contact with physicians, consideration of the advantages of an open-view prescription department a professional library and methods for promoting the professional phases The trend should be to the fundamentals of pharmacy and emphasis should be on quality and service

Walter J Hartung addressed the annual meeting of Columbia University College of Pharmacy January 16th, on Changing Styles in Modern Materia Medica"

J A Porter, Lincoln Neb, has been appointed member of the Nebraska Board of Pharmacy

Prof Alexander Tschirch, of Bern, Switzerland, celebrated his 77th birthday on October 17th Many of the prominent leaders in European pharmacy called at his home to extend congratulations This visit was arranged by Dr Ferchl of Mittenwald, who is well known on account of his famous pharmaceutical calendar which has been published for many years

Prof Tschirch was formerly head of the Pharmaceutical Institute in Bern, the new building for which was recently dedicated He is an honorary member of the AMERICAN PHARMACEUTICAL ASSOCIATION

Dr Horatio N Fraser, pioneer in the tablet triturate industry, received the congratulations of the New York Veteran Druggists on his 82nd birthday, November 30th

Mrs John F Hancock and Mrs Charles E Dohme (Baltimore), widows of A PH A ex-presidents, celebrated their 93rd birthdays this month All good wishes are extended

Our fellow-member, **Vladko Bartulic,** is owner of the pharmacy in Zagreb Jugoslavia, dating back to 1599 Recently Mr Bartulic refurnished the pharmacy throughout He has photographs of nearly every owner and these with sketches are collected in a 36-page booklet, published as part of the celebration of the 333rd anniversary of the establishment

Theodore D Wetterstroem issued a publicity statement in which he stressed the importance of the pharmacist in public health service He dwelt with particular emphasis on the general adherence of pharmacists to standards

Leo G Penn, a member of the faculty of Temple University Pharmacy School was elected president of the Philadelphia Association of Retail Druggists at the annual meeting of the organization

Hugo Kantrowitz, former editor of New York *Apotheker Zeitung,* was elected *honorary president* of the New York Veteran Druggists' Association

James H Beal, E Fullerton Cook, Samuel L Hilton, E F Kelly and Samuel C Henry attended a meeting of the Board of Trustees, U S Pharmacopœia, in Washington, during the week of January 22nd They also conferred on the food and drug bills now in Congress in the consideration of which they joined by President R. L Swain, of PH A

OBITUARY

BARNETT MILLER

Barnett Miller, member of the AMERICAN PHARMACEUTICAL ASSOCIATION, died January 3rd aged 61 years, of pulmonary embolism, following an automobile accident

Mr Miller was born in Russia, September 22, 1872 He graduated from Brooklyn College of Pharmacy in 1902 won the Junior Medal in 1902, the Brundage Medal in 1903 the post graduate Gold Medal in 1906, and earned the Phar D degree

Mr Miller engaged in the drug business on his own account at 53rd St & Third Ave and was secretary of Ormant Drug & Chemical Company at the time of his death He was financial secretary of New York Retail Druggists' Association for about 14 years, served as treasurer for 2 years and for one year as its president He was a member of New York Pharmaceutical Association, New York Apothecaries' Association, Drug and Chemical Square Club and held important offices in other drug and pharmaceutical organizations

Mr Miller was a member of the Masonic bodies, under whose auspices the funeral services were held

The deceased is survived by his wife a son and a daughter

H W Eddy, Attorney, in fact for the Casualty Indemnity Exchange and the Druggists' Indemnity Exchange, St Louis died January 6th

OTTO WIDMANN

Otto Widmann, outstanding Missouri ornithologist, died at his home in St Louis, November 26th, aged 92 years He was the son of a German naturalist and came to the United States as a young man, he engaged as a drug clerk and later, for many years was proprietor of a St Louis pharmacy For about sixty years he carried on the studies which have made him known throughout the world, his writings became textbooks and many naturalists followed in his footsteps It is said he knew birds as few persons know them, he was the first student, in his section, to welcome the return of his feathered friends and the last to bid them goodby He retired from the drug business about 30 years ago, so that he could devote all of his time to studies

L C BRENNER

Just before closing forms for the January JOURNAL we are advised by Walter D Adams of the death of L C Brenner of Gonzales Tex, president of Texas Pharmaceutical Association, 1932–1933 Further notice will be made in the February JOURNAL

DR KEIZO IKEGUCHI

Dr Keizo Ikeguchi died at his home on December 1st He was a member of the Commission on Japanese Pharmacopœia, president of the Japanese Hygienic Chemical Society and president of Tokyo College of Pharmacy He was a graduate of Tokyo Imperial University and associated with every movement for the advancement of pharmacy in Japan

LEGAL AND LEGISLATIVE

WHERE IS THE FINAL RESPONSIBILITY FOR THE EFFICIENT ADMINISTRATION OF CODES?

Frank S Pollak, Counsel, states that the final responsibility rests with NRA A code, when once approved by the President, becomes a law of the United States, and it is the duty of the Government to see that it is carried out NRA will therefore supervise code administration by code authorities but it is the aim of NRA to help industry develop its own agencies of self government and to give to the Code Authority in each industry as much responsibility as it is able to take in the administration of its code

AN EXECUTIVE ORDER SEEKS TO PROTECT THE SMALL DEALER

President Roosevelt has issued an executive order intended to protect the small business man against monopolies in conforming with the requirements of the codes under the national recovery act To eliminate discrimination against small enterprises, the President's order makes it possible for complainants operating under the codes to go before the Federal Trade Commission or to the Department of Justice for redress

Under such a method grievances can be adequately aired and settled by disinterested governmental agencies in accordance with the

principles set forth in the recovery legislation According to the President's order, the Federal Trade Commission, in handling such complaints, will follow the procedure set forth in its organic act In the event the nature of the complaint is such as to be beyond the jurisdiction of the Federal Trade Commission, the President's order makes it possible for the complainant to take his grievance to the Justice Department

DRUG CONFERENCE BILL IN SENATE

The National Drug Trade Conference Bill to amend the present food and drugs act was introduced in the senate by Senator H D Stephens of Mississippi

The bill is the same as that introduced in the house by Representative Loring Black It bears the number S 2355, and was introduced by the Senator 'by request" Senator Stephens is chairman of the Senate Committee on Commerce, which also has before it the revised Tugwell food and drug bill sponsored by Senator Royal S Copeland of New York

The special committee of the conference, appointed at the last annual meeting to promote reasonable revision of the food and drugs act, met in Washington January 24th, to discuss the various bills offered for such revision

LEGALITY OF RETAIL AUCTIONING OF DRUGS QUESTIONED

Assistant Attorney General G C A Anderson holds that retail auctioning of drugs and drug preparations cannot be held outside of a pharmacy under the pharmacy and drug laws of Maryland In his opinion

The pharmacy and drug laws of this state contain various provisions regulating pharmacies, many of which are for the protection of the public against indiscriminate sale of poisonous drugs or harmful medicines None of these provisions is complied with or even remotely fulfilled in a sale of this character

'Therefore, it is my opinion that the auction sale of drugs, as outlined, cannot be held under the pharmacy and drug laws of this state"

BOOK NOTICES AND REVIEWS

Illustrierter Apotheker Kalender 1934—Illustrierter Apotheker Kalender 1934, prepared by DR FRITZ FERCHL, Mittenwald, Germany, price 75¢

This annual publication is always welcome This issue is the ninth, and is full of historical material, beautifully illustrated Quite a number of drug jars of various periods are shown, on one page prescriptions of the father of the poet Schiller are reproduced Quite a number of old apothecary shops are among the illustrations, and apparatus of the eighteenth century Then follow pictures of pharmacies in which the religious thought enters There are also quite a number of mortars of various periods A picture of the old E Merck pharmacy—The Engel Apotheke Throughout the Kalender will be found much interesting historical information Those who have had an earlier copy of this Kalender will no doubt desire the one for 1934

The Medicinal and Poisonous Plants of Southern Africa By JOHN MITCHELL WATT, M B , Ch B , professor of Pharmacology in the University of Witwaterstrand, Johannesburg and MARIA GERDINA BREYER AND BRANDWIJK, formerly lecturer in Pharmacology and research worker in Phytochemistry in the Department of Pharmacology, University of Witwaterstrand, Johannesburg Published by Wm Wood & Co , Baltimore This volume of more than three hundred pages contains twelve illustrations in color and twenty in black and white It gives an account of the medicinal uses, chemical composition, pharmacological effects and toxicology in man and animals of the medicinal and poisonous plants of Southern Africa One hundred twenty-eight plant families are represented and many of them are described at length and others briefly The aim has been to give all the available information on the medicinal uses, chemical composition, pharmacological effects, and human and veterinary toxicology of the flora of Southern Africa The book forms a useful basis for new work and its publication may prevent overlapping and repetition by other workers in this field The authors hope that the medical practitioner, the pharmacist, the missionary the forensic workers and the scientist will find it of value in their several spheres

The indices give botanical names of the plants common names from European lan-

guages, native names and active principles, obsolete names have also been recorded The authors have given the results of research relating to the plants, they are deeply indebted to the station of the Division of Plant Industry at Pretoria for determining the plant specimens which number over twenty-five hundred

Allan's Commercial Organic Analysis, Volume X, published by P Blakiston Son & Co , Inc , Philadelphia, Pa

Preceding volumes of this valuable publication have been reviewed in the JOURNAL and all of the commendatory references made heretofore apply to this volume It is well bound and printed and covers more than 800 pages

Volume X is devoted to Haemoglobin and Its Derivatives, Albuminoids or Scleroproteins, Structural Proteins, Examination of Foodstuffs for Vitamins, the Hormones, the Identification of Unknown Woods and Charcoals, the Pectic Substances

The Editor is C Ainsworth Mitchell of the *Analyst*, consulting chemist of London and other contributors are J Addyman Gardner G A Buckmaster, J Alexander, W P Dreaper R H Marriott J C Drummond, Katherine Coward, K Culhane S W F Underhill, J C Maby H W Buston and M B Elliott This volume completes the fifth edition of "Allan's Commercial Organic Analysis," and as the Editor states, the subjects treated have become more miscellaneous in character than the preceding editions It is hardly possible for a chemist to carry on his researches without this work and this applies also to those doing research in pharmacy This volume contains the *general index* As stated, this publication is so generally and favorably known that it is unnecessary to extend this notice

Spezialitäten Taxe, published by the German Apothecaries Society This comprehensive index of more than twelve hundred pages lists all medicinal preparations in the various forms represented on the market, proprietary preparations, officials, etc Those coming under specific legislation, as narcotics are designated, also, the purposes for which they are used and the industry or profession employing them In other words, the information given is of value to all pharmacists, druggists manufacturers and dealers

It is a German publication but can readily be used as reference by all engaged anywhere in the drug industry The tabulation gives the information required on all preparations, as far as purchase and selling prices are concerned The first column notes whether the product comes under specific legislation, the next column gives the wholesale price followed by the name of the preparation, form and other descriptive matter The next column describes the package, then follows the selling price without tax or duty and then the selling price with tax or duty Several columns enable the user to make additional references

This is the fifteenth edition of the book which speaks for the usefulness of the publication in so far as its purpose is concerned the publication deserves commendation The price is R M 20 00

FEDERAL FOOD, DRUG AND COSMETIC ACT

Representatives of the National Drug Trade Conference held meetings during the week of January 22nd, and in conference with Charles Wesley Dunn framed a new bill which corrects the defects and undesirable features of other bills in Congress Representatives of the food and cosmetic industries have signified their approval and willingness to back the measure and it is hoped that Senators Copeland and Stephens, and Representative Loring Black will find the measure acceptable, so that there may be unison in the promotion of the new bill

The object of the bill is stated to be for the purpose of preventing adulteration, misbranding and false advertising of food, drugs and cosmetics, in the commerce affected, for the following purposes, namely, to safeguard the public health and to protect the purchasing from injurious deception The suggested title of the bill is given as "Federal Food Drug and Drug and Cosmetic Act "

WINNER OF THE NATIONAL PHARMACY WEEK CONTEST

We are in receipt of a *Bulletin* of the National Pharmacy Week Executive Committee Anton Hogstad, Jr , *Chairman*, through which we are advised that O U Sisson well and favorably known Chicago pharmacist, has been awarded first place in the 1933 National Pharmacy Week Window Display Contest Honorable mention is made by the Committee of C Thurston Gilbert Noroton Heights, Conn , S M Leoncavallo Wilmington, Del , H Dratzka, South Milwaukee, Wis , Emerichs Pharmacy, Orlando, Fla

PHARMACY AND THE DRUG STORE

This is no time to criticize, unless the purpose is to be helpful to cooperate in improving conditions that exist, to establish confidence

A disturbing factor starts most of us to thinking, it is unnecessary to be reminded of how conditions developed that cause us to realize what our standing is and be convinced that we have not been as earnest as we should have in persistently striving to attain the opportunity that is always beckoning to us from the horizon of the future Fifty years ago, William S Thompson, of Washington, D C, then president of the AMERICAN PHARMACEUTICAL ASSOCIATION, said in his presidential address "Are we not justified in the belief that from the present trade conflict there will survive a higher pharmacy than that of our time? We are sustained in this opinion by a survey of the entire situation of pharmacy in this country characteristic of our country in all that pertains to science and art—our profession will not lag behind, but the followers fully equipped with knowledge and skill, will stand shoulder to shoulder with the most advanced, and with equal strides will move on to that brighter era for which they appear to be preparing"

The representative of the U S Public Health Service at the Diamond Anniversary Meeting of the A PH A said that "the thing which challenged his admiration more than anything else was the evident broadening scope of the organization—the broad statesmanship displayed in the laudable effort to bring together many divergent interests which have, however, one objective in common—the advancement of pharmacy"

The closing paragraph of an editorial in the *Australasian Journal of Pharmacy* seems applicable and is quoted "The call in pharmacy to-day is the will to adopt a plan and to stick to it until it is brought to a final and successful conclusion There is much that cannot be done—there are forces that cannot be overcome by direct attack—but by means of flank attacks and concerted action by the whole body along definite lines the way can be paved to brighter and better things The heritage of pharmacy lies in the traditions of the past Its future depends on those who are practising its profession to-day Great responsibility is cast on those who are leading in the van, but equally so is the need on the part of all of the true cooperative spirit that is willing to sacrifice to some extent its individuality in order to gain a greater success for the good of all"

We are not merely passive observers of a stupendous national drama, and our destiny is dependent on our resourcefulness and our character A result for the good of the public should come out of this adjustment in restricting the sale and dispensing of medicines to those qualified by education and training Times like the present bring to the fore a realization of conditions which have not heretofore been disturbing factors and it is to be hoped that the public will gain a clearer appreciation of the fundamentally important rôle of pharmacy for its protection

In proper shaping of affairs the thought must lead that success depends on unison in action as far as this is reasonably possible, and confidence within the groups is essential, strengthened by a right understanding with related activities

DR ROBERT P FISCHELIS

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIII FEBRUARY 1934 No 2

ROBERT PHILIP FISCHELIS

Robert P Fischelis, president-elect of the AMERICAN PHARMACEUTICAL ASSOCIATION, son of Philip and Ernestine (Kempt) Fischelis, was born in Philadelphia, Pa , August 16, 1891 He received his early education in St Paul's Lutheran Parochial School, Philadelphia, and the public schools of that city, graduating from the Northeast High School in 1908 The same year he engaged with James Huston, prescription pharmacist, Philadelphia The following year he entered the Pharmacy School of the Medico-Chirurgical College of Philadelphia, graduating at the head of his class in 1911 Among the five medals and prizes he received was a year's membership in the AMERICAN PHARMACEUTICAL ASSOCIATION, offered by Prof George R Meeker for the highest mark in analytical chemistry He immediately joined the ASSOCIATION and has been a member ever since Dr Fischelis continued his studies in the Department of Pharmaceutical Chemistry of the Medico-Chirurgical College and in the College of Liberal Arts and Sciences of Temple University, receiving the Ph C degree from the former and the B Sc in Chemistry from the latter

In 1912, he began teaching Pharmacy and Organic Chemistry in the Department of Pharmacy of the Medico-Chirurgical College, and also taught Pharmacy in the Department of Medicine During this period he took up graduate work and, later, received the Doctorate in Pharmacy from the Medico-Chirurgical College In addition to his education in Pharmacy and Chemistry, Dr Fischelis also took courses in Bacteriology at the University of Pennsylvania Summer School, and courses in Economics at the Wharton School of Commerce and Finance of the University of Pennsylvania After the Pharmacy School of the Medico-Chirurgical College merged with the Philadelphia College of Pharmacy and Science, the degree of Master of Pharmacy (in course) was conferred upon him

In 1914, Dr Fischelis became associate editor of the *Druggists Circular*, which was then under the editorial guidance of Dr H V Arny While holding this position he continued teaching on a part-time schedule in Philadelphia He left

the *Druggists Circular* in 1916 to join the Scientific Staff of the H K Mulford Company in Philadelphia, continuing part-time teaching at the Medico-Chirurgical College and, later, at the Philadelphia College of Pharmacy and Science

He left the Mulford Company to join the Chemical Warfare Service, U S A, during the War Upon leaving the army, he opened his own office in New York City as a consulting pharmacist and chemist He also joined the editorial staff of *Industrial and Engineering Chemistry* under Dr C H Herty and, later, became managing editor of the *News Edition* of that publication He relinquished this post in 1928 because of pressure of other duties

From 1921 to 1925, Dr Fischelis was dean and professor of Pharmacy at the New Jersey College of Pharmacy in Newark, New Jersey During his incumbency, this institution grew from a student body of approximately fifty to one of about two hundred and fifty Official recognition was granted the college during this period in the states of New Jersey and New York, Pennsylvania and others and it also obtained membership in the American Association of Colleges of Pharmacy He was instrumental in beginning negotiations for the affiliation of the college with Rutgers University and conducted a campaign for funds among its alumni and friends for a new building He was elected vice-president of the American Association of Colleges of Pharmacy in 1924 He resigned as dean of the New Jersey College of Pharmacy in 1925, spent several months recovering from a breakdown in health and then resumed his consulting practice and continued his editorial activities At this time he also became educational advisor to the Board of Pharmacy of the state of New Jersey In 1926, he was offered and accepted the secretaryship of the Board of Pharmacy of the state of New Jersey, upon the demise of the late Prof Jeannot Hostmann, he was also made chief chemist of the Board, and has held these positions since 1926, making his headquarters in Trenton

The president-elect has been active in association work for many years From 1913 to 1915, he was secretary of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION In 1916, he was secretary of the Section on Commercial Interests, A PH A, and the following year he served as chairman of this section From 1923 to 1925, he served as secretary of the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION and chairman of the Committee on Publications From 1931 to 1933, he was president of the New York Branch, A PH A, was elected first vice-president of the parent ASSOCIATION in 1933 and is now serving in that capacity

Both the Pennsylvania and the New Jersey Pharmaceutical Associations have been served by Dr Fischelis in an executive capacity From 1916 to 1919 he was secretary of the Pennsylvania Pharmaceutical Association, and in 1919 he became its president He founded and edited the *Pennsylvania Pharmacist* while secretary of the Association In 1926, when the late Professor Hostmann, secretary of the New Jersey Pharmaceutical Association, passed away, Dr Fischelis was asked to accept the secretaryship for the unexpired term and was persuaded to continue in that office until 1929, when he resigned because of pressure of his official duties and new work undertaken for the Committee on the Costs of Medical Care While secretary of the New Jersey Pharmaceutical Association, he founded and edited the *New Jersey Journal of Pharmacy* He also served this Association as second vice-president in 1923–1924 and as first vice-president in 1924–1925 At present he is a member of the Board of Trustees of the Association and chairman of several

of its committees Since 1931, he has been vice-president and chairman of District No 2 of the National Association of Boards of Pharmacy From 1920 to 1932 he was editor of the news service of the Drug Trade Bureau of Public Information He has edited the Charter's Report, published under the title "Basic Material for a Pharmaceutical Curriculum"

Dr Fischelis is a member of the American Chemical Society, the American Public Health Association, the American Medical Association, the Chemists' Club of New York, the Rotary Club of Trenton and a fellow of the American Association for the Advancement of Science He was a delegate to the U S P Revision Conventions of 1920 and 1930, and is a member of the A PH A Recipe Book Committee

He is a member of the Kappa Psi fraternity, the Beta Phi Sigma, Phi Lambda Upsilon, honorary Chemical Society, and a member of the American Legion He is a former president of the Alumni Association, Department of Pharmacy, Medico-Chirurgical College and of the Alumni Association of the Philadelphia College of Pharmacy and Science

Since 1926, he has been a cooperating state official of the U S Food and Drug Administration, and he has also taken an active part in the Conference of Pharmaceutical Law Enforcement Officials He gives an annual series of lectures on pharmaceutical journalism and on patents and trade-marks at The Philadelphia College of Pharmacy and Science

As a member of the Research Staff of the Committee on the Costs of Medical Care, Dr Fischelis, in cooperation with Dr C Rufus Rorem, made a survey of the manufacture and distribution of drugs and medicines in the United States and the services of pharmacy in medical care The results of this survey have been published by the University of Chicago Press in book form under the title "The Costs of Medicines" He is a frequent contributor to various pharmaceutical and chemical publications, and is the author of the chapter entitled "Medical Materials Industry" found in Volume X of the Encyclopedia of the Social Sciences Section III of the National Pharmaceutical Syllabus, dealing with State Board examinations, was written by Dr Fischelis, who was also chairman of the sub-committee on cultural and basic subjects of the Syllabus Committee

In 1933, he was appointed a member of the Governor's School Survey Commission which has been engaged in studying the educational program of the state of New Jersey

In 1919, Dr Fischelis married Miss Juanita C Deer of Chicago

Hygiene Exposition Held in Lima—The President of the Republic inaugurated on December 10th for 15 days the First International Hygiene Exposition held in this city under the auspices of the Bureau of Health, Ministry of Fomento (Commercial Attache Julian D Smith, Lima)

Druggists' Exhibit at the Leipzig Sample Fall Fair 1933 Proves Great Attraction—The official figures of the Leipzig sample fall fair of 1933 included also the exhibitors at the "Brown Fair" held on the Fair Grounds where the Association of Leipzig Druggists maintained a collective exhibition for advertising and propaganda purposes While this special exhibit of Leipzig druggists proved a great attraction for the local visitors and those from neighboring cities, its effect on the wholesale and export business was slight (Vice Consul P Mallon Leipzig)

EDITORIAL

E G EBERLE EDITOR 2215 Constitution Ave , WASHINGTON D C

THE PHARMACY EXHIBIT—A CENTURY OF PROGRESS INTERNATIONAL EXPOSITION

THE 1933 Pharmacy Exhibit of the World's Fair will very likely be continued this year, Medicine and Dentistry have decided on doing so Illustrations of the Pharmacy Exhibit are shown in the January (1933) number of the JOURNAL, pages 1 and 4 and in the July issue, pages 592 and 594, and comments appear in the same numbers and also elsewhere in other issues of the year The Committee on Pharmacy Exhibit consisting of H C Christensen, *Chairman*, J H Riemenschneider, *Treasurer*, and Frank B Kirby, *Secretary*, has issued a general letter to the press acknowledging contributions and thanking the contributors and cooperators for their financial help and valuable services, including manufacturers and wholesalers, associations, publications, retailers and individuals

The following is quoted from the letter of appreciation in which the names of the donors are given

> Invaluable aid in planning and building the exhibit material was rendered by sub committees the chairmen of which were as follows Educational C B Jordan Historical, Edward Kremers United States Pharmacopœia E Fullerton Cook Legislation R L Swain Service in Public Health E F Kelly Professional C Leonard O Connell
>
> Special mention for valuable assistance in installation work personnel etc , is also due to R W Terry and E N Gathercoal of the University of Illinois Edward Ireland of the University of Wisconsin H W Heine and C J Zufall, of Purdue University also O U Sisson of Chicago
>
> The Committee is indebted to the pharmaceutical press of the country for the splendid publicity given to the exhibit, to the Century of Progress officials for the donation of the space including electricity, this being the biggest debt as the space had a commerical value of approximately $15 000 to Mrs Lillian H Bowen for handling the correspondence and clerical details of the exhibit to Thaddeus Niemic who had charge of the professional demonstrations and to Miss Esther H Barney Superintendent of the Exhibit goes a large share of the credit for the day to day success of the exhibit in impressing the thousands of visitors both professional and laymen with the importance of pharmacy and pharmaceutical service in the field of public health "

We would repeat what was said in a number of the issues of the JOURNAL regarding the exhibit and express appreciation for the outstanding work of the committee, American pharmacy is indebted to the members for the services rendered by them Acknowledgment was made by resolution at the meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION in Madison, and further expressions of appreciation by individuals, affiliated bodies and other organizations evidenced the importance of the exhibit

While the value of the Exhibit is recognized as a pronounced success the committee feels that a number of improvements can be made and invites suggestions for carrying on the exhibit this year Further comments will be made in succeeding numbers of the JOURNAL with the purpose of giving the members of the committee every possible assistance Pharmacy was given equal recognition with related professions in the Medical Section The exhibit provided a valuable contact with the public and a publicity which greatly benefits pharmacy

PAN-AMERICAN MEDICAL ASSOCIATION

LAST year pharmacists were invited to participate in the program of the pharmacopœial section of the Pan-American Medical Association meeting in Dallas Theodore J Bradley presided over the sessions, at which time many papers bearing on pharmacopœial work were read and the possibilities of "Pan-American Pharmacopœial Uniformity" were presented in a paper by E Fullerton Cook, printed in the May JOURNAL for 1933, page 456

Pharmacists are again invited to participate in the program In the paper referred to it was pointed out that "the establishment of a Section on Pharmacopœias as a regular function of the organization opens a new line of interest and service in Pan-American cooperation which is most gratifying The idea of a Pan-American Pharmacopœia and in fact the effort to develop an 'International Pharmacopœia' is not new, but every earlier effort failed because such an idea is not in conformity with the spirit of strong nationalism which exists in every country We may well benefit from the experience of the international groups who made their first progress by agreeing upon a policy which did not interfere with the continuance of their own national Pharmacopœia but, in principle, obtained practically all of the benefits of an 'International Pharmacopœia' "

This year's conference will be held on the S S Pennsylvania A program has been outlined for the floating Congress to Venezuela, March 14th–30th

Many of the papers will be read during a four-day session at sea, but there will be a session in Venezuela also The physicians will visit Colon, Cartagena, Puerto Cabello, Caracas, La Guayra and San Juan, P R In Venezuela the members of the party will be entertained at Maracay, the home of President Gomez The party will then go to Caracas, returning by way of San Juan the members will be guests of the Governor of Puerto Rico, Dr Morales Otero, president of the Medical Association in Puerto Rico, and Dr George Bachman, director of the School of Tropical Medicine, Columbia University of Puerto Rico

---

HISTORICAL PHARMACIES

THE following resolution was adopted at the Madison meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION

Resolved that the Local Branches of the AMERICAN PHARMACEUTICAL ASSOCIATION, State Pharmaceutical Associations Boards and Colleges of Pharmacy as well as other organizations and individuals interested in the progress and development of pharmacy be urged to supply documents of historical interest, relics and museum material to the museum and library of the Headquarters Building of the AMERICAN PHARMACEUTICAL ASSOCIATION at Washington and be it further

Resolved, that organizations and individuals interested in the progress of pharmacy be urged to prepare papers on matters of historical interest for presentation to the Section on Historical Pharmacy of the AMERICAN PHARMACEUTICAL ASSOCIATION

The purpose of this comment is to bring to the attention of pharmacists the possibilities of preserving historical pharmacies in various localities This was brought to mind by a brief history of Apothecaries Hall, New Haven, Conn, published in connection with the celebration of the 150th anniversary of the New

Haven County Medical Society (1934) and the 113th anniversary of Apothecaries Hall The history of the latter was prepared by the son of Emil A Gessner,[1] long a member of the AMERICAN PHARMACEUTICAL ASSOCIATION and, until his demise, February 3, 1930, proprietor of Apothecaries Hall

A replica of Philo Carpenter's drug store, Chicago, is part of the Pharmacy Exhibit—A Century of Progress—a sketch by William B Day is printed in the September JOURNAL for 1931, pages 922-924 A sketch of General Mercer and his apothecary shop appears in the June number of the JOURNAL for 1926, page 425 The list of pharmacies which have been depicted can be extended, but the purpose is to awaken an interest to preserve historical pharmacies or place plates on the buildings that housed them, which will acquaint the citizens and visitors with related historical data

Recently, the Leadbeater Pharmacy has been purchased for the AMERICAN PHARMACEUTICAL ASSOCIATION It is the intention of the Association for the Preservation of Alexandria Antiquities to restore the interior and open the building as a museum During a recent visit the doors that belonged to the pharmacy in its earliest days were found in the attic Its restoration will make it possible to visit where Washington had his medicines prepared by Edward Stabler, the founder of "Leadbeater Pharmacy"

The Headquarters Building is now prepared to receive historical material for its museum—an historical description should accompany the contribution

CENSUS OF THE DRUG INDUSTRY AND PHARMACY

THE Bureau of Census for the calendar year 1933 is in preparation and the Department is urging all activities to reply promptly in giving the information requested in the circular The importance for doing so is in the fact that the data will be helpful in presenting conditions in the industry on which action may be taken on questions that concern druggists and pharmacists Without such information misunderstandings are bound to occur, without the possibility of presenting necessary details Arguments in attempting to arrive at conclusions regarding the code have shown that officials are not always informed on questions applying to the drug store that are very different from those in other activities

No similar census has been undertaken since 1929 and the Bureau is asking that druggists render complete reports promptly When the reports have been received separate compilations are to be made covering the different divisions of the drug industry This comment is prompted by the belief that this census is of greater importance than those immediately preceding

Cod Liver Oil Steaming Plants in Norway—There are approximately 800 steaming plants in Norway, according to an estimate furnished by the Bureau of Fisheries The total number of producers of raw cod liver oil is unknown, but exporters estimate the total to be around 500 who produce from 2 to 20 barrels each The number of such producers has been decreasing from year to year as fast as new steaming plants have been opened in the various districts (Office of the Consulate Bergen)

[1] See November JOURNAL 1928, page 1071

SCIENTIFIC SECTION

ANTIDOTES III THALLIUM *

BY JAMES C MUNCH, CONSULTING PHARMACOLOGIST, BUREAU OF BIOLOGICAL SURVEY, GLENOLDEN, PA

In 1924 laboratory investigations suggested the value of thallium in the control of various rodents Field tests conducted in the next few years validated our laboratory conclusions (19, 21) Literature did not reveal any definite information regarding antidotes for thallium poisoning, so studies along this line were undertaken These experiments were conducted in the Washington laboratory of the Bureau of Chemistry (now called the Food and Drug Administration) of the United States Department of Agriculture at an elevation of about one hundred feet above sea-level Thallium sulphate solutions were included in the diet, or injected subcutaneously or intravenously into dogs Less extensive studies were made on rabbits, rats, guinea-pigs and cats Dogs used in this work were fed 100 Gm of ground lean meat containing five per cent of dried whole milk powder daily Bones were included in the diet once a week Drinking water was available at all times No evidence of dietary disease was noted among the control animals The development of thallotoxicosis was followed daily and definite symptoms were recognized as characteristic of thallium poisoning (9, 16, 18, 20) In some experiments the protective procedure was commenced at the time poison was administered In other experiments treatment was delayed Chemical studies of thallium elimination under various methods of treatment were contemplated, but were not carried out in detail then because of the lack of suitable analytical methods With the development of quantitative methods, chemical essays are used to control the efficiency of various procedures

TABLE I—CERTAIN LETHAL DOSE OF THALLIUM—MG TL PER KG

Animals	Method of Administration			
	Oral	Subcutaneous	Intraperitoneal	Intravenous
Frogs		2 5–60 (?)		
		150 (3)		
Birds	35–50	40–160		
Mice	25 (5)	70 (2)	70 (2)	
			30 (4)	
Rats	25 (5)	60 (2)	60 (1)	
			40 (2)	20–25
Guinea pigs		70 (2)	70 (1)	
		10 (5)	10 (5)	25
Rabbits	500	20–60		25 (1)
Hedgehogs		36		
Cats	250–500	15		
Dogs	15–100	15–45	13	20–25

Foot note The figures in parentheses represent the day's interval between injection and death

The intravenous administration of 25 mg of thallium per kilo (in the form of thallium sulphate) was followed by death within five to ten days, and this was

* Scientific Section, A PH A, Madison meeting, 1933

selected as the certain lethal dose (L D 100) Smaller doses occasionally killed, although the percentage of recoveries increased as the dose decreased Twenty-five mg of thallium per kilo fed to rats or intravenously injected in the marginal ear vein of rabbits produced death within three to five days (21) Available results upon toxicity to various animals are given in Table I

Based on a knowledge of the chemical behavior and toxicity of thallium compounds, various drugs were administered in attempts to counteract the poisonous effects

(1) *Sodium thiosulphate* had been considered as an antidote in the treatment of heavy metal poisoning, although in 1924 no references to its use in thallotoxicosis were found Our original tests failed to show definite relief following its use Oral administration had very little effect Intravenous injections often increased the severity of thallium symptoms within twenty-four hours The following year Buschke and Peiser (5, 7, 8) published their study on this question and reached the same conclusion

(2) The insolubility of the *halides* of thallium led to the study of the possibility of protecting animals by a course of treatment with the chloride or iodide of sodium or potassium The potassium salts were useful but caused cardiac depression Administration of sodium chloride was somewhat less effective than sodium iodide The elimination of thallium was followed by flame tests on twenty-four hour urine samples to determine the relative intensity of green color Treatment with sodium iodide decreased, and treatment with sodium thiosulphate increased the thallium excretion in the urine

(3) One outstanding feature of thallium poisoning is the general endocrinological depression Various endocrine stimulants were considered and finally *pilocarpine* was adopted because of its low toxicity in effective doses Not only does pilocarpine serve as an endocrine stimulant, but also it stimulates perspiration As thallium is eliminated in the sweat, this was believed to reduce the strain on the kidneys

(4) Thallium poisoning produces hypo- or achlorhydria (13, 14, 15, 21) Therefore, *hydrochloric acid* was given by mouth to dogs with some success, as an adjunct to other methods of treatment

(5) Marked disturbances of *calcium* metabolism have been observed in thallotoxicosis Our studies did not indicate any particular benefit following the administration of calcium salts alone, but in conjunction with iodide-thiosulphate treatment appeared to favor more rapid recovery

(6) Subsequent reports of studies on treatment suggested and denied the value of various *glandular extracts*, more particularly thymus, parathyroid and pituitary gland extracts (1, 2, 3, 6, 8, 9, 10, 11, 14, 15, 17, 21, 22, 23, 24) No laboratory studies were made with glandular extracts in the 1924 investigations The incorporation of various glandular extracts in the treatment of thallium poisoning to dogs in later studies did not appear to be successful

Based on results obtained in the 1924 animal experiments, it was felt that thallium poisoning would be combated most successfully by (*a*) intravenous administration of sodium iodide until thallium had practically disappeared from the twenty-four hour urine, (*b*) sodium thiosulphate intravenously to induce gradual elimination of thallium, (*c*) pilocarpine and calcium salts intravenously, and (*d*)

oral administration of hydrochloric acid This regime based solely upon tests on animals may be inadequate, since there is always a question regarding the efficacy of an antidote *for* humans, unless it is firmly established by experiments *upon* humans Recognized methods of treating strychnine or arsenic poisoning which were developed upon animals have shown somewhat disappointing results when employed upon man, and vice versa The need for extreme caution in advocating any specific course of treatment as "a successful antidote" for any poison is appreciated For this reason this regime was not included in the 1931 report (21) in which reference was made to the use of iodides or chlorides and to sodium thiosulphate intravenously

What results have been obtained in treating human thallotoxicosis? Thallium is commonly, or at least frequently used in medicine Of 8006 children who received thallium acetate as a depilatory, 447 were poisoned and 8 died A number of reports of clinical, cosmetic, rodenticidal and suicidal thallium poisoning have been collected

The extensive survey by Buschke and Peiser (9) contains several reports of attempts to counteract human thallotoxicosis Bogdanov and Lasko (4) relieved pains in the extremities in two cases of thallium poisoning by sodium thiosulphate, Mrongowius and Duchan (18) in 1928, and Caluzzi (12) in 1929, observed a decrease in toxicity of thallium salts to older children by administration of 1 to 1 5 Gm of sodium thiosulphate three times daily Subsequent administration of sodium thiosulphate accelerated recovery following clinical use of thallium For the treatment of thallotoxicosis Mrongowius and Duchan (18) recommended a combination of 5 Gm of sodium thiosulphate and 5 mg of pilocarpine nitrate in 20 cc of distilled water It is of interest, in this connection, that Buschke, Duchan and Joseph (7) were unable to obtain any benefit by using this treatment upon thallium-poisoned animals

Over thirty-one persons were poisoned by thallium in January 1932, near Fresno, California (16, 20), at an elevation of two hundred feet above sea-level Fourteen were hospitalized, one being less seriously poisoned than the others Eight patients who were treated by this regime recovered Six others who were treated with sodium thiosulphate, dextrose and parathyroid extract died It is not certain that these eight patients would have died if this regime had not been followed, however, in the opinion of the attending physicians their clinical condition was as serious as the condition of those who died

CONCLUSIONS

1 Experiments upon animals in 1924 led to the development of a definite method for combating thallotoxicosis treatment with sodium iodide, sodium thiosulphate, pilocarpine, calcium salts and hydrochloric acid

2 This regime was successful in treating eight humans poisoned by thallium, six untreated patients died

CERTAIN POISONOUS PLANTS OF WYOMING ACTIVATED BY SELENIUM AND THEIR ASSOCIATION WITH RESPECT TO SOIL TYPES

BY O A BEATH, J H DRAIZE, H F EPPSON, C S GILBERT AND O C MCCREARY

In 1917, the senior author published a brief treatise[1] on the poisonous properties of the two-grooved milk vetch (*Astragalus bisulcatus*) The toxic principles

[1] Wyoming Experiment Station Bulletin 112

were reported to be soluble in water and not found to be precipitated by basic acetate of lead Studies and observations made since that time led to the publication of an experiment station bulletin[1] in May 1932, on "Three Poisonous Vetches," by Beath, Draize and Eppson The authors pointed out that *A bisulcatus* collected in some areas had an extremely offensive odor, while in other places this feature was lacking entirely It was further stated that this variation was in a degree due to soil and climatic factors From the viewpoint of experimental physiological data it was pointed out that at the "past-seeding stage" *A bisulcatus* plants produced an accumulative type of poisoning accompanied by severe irritation to the gastro-intestinal tract Members of the chemical research staff then set about to determine the reasons for such behavior in *A bisulcatus* and other poisonous plants associated with it in habits of growth

It has now been demonstrated that those *A bisulcatus* plants yielding a decidedly offensive odor are more toxic than plants of this species lacking in this characteristic The only variable factor contributing to this difference, so far determined, is the presence of selenium

With the cooperation of the State Geologist, Dr S H Knight, and his staff, a correlation of some range plants bearing selenium has been made in conjunction with the geological formation upon which the plants grow Three species of Astragali, *A bisulcatus*, *A Grayi* and *A pectinatus*, *Xylorhiza Parryi*, *Oonopsis condensata*, *Stanleya bipinnata* and *Mentzelia decapetala* represent at this point in our investigations definite indicator plants that have shown the constant presence of selenium when collected on one or more of the following formations Niobrara, Steele, Pierre, Morrison, Wasatch (as represented by Cooper Basin), Benton, Hilliard-Cody, Lewis, Bridger, and the dark band of the Dakota These formations are mostly shale The so-called indicator plants are the richest in selenium when they occur on the undecomposed shale The element selenium is distributed throughout the entire makeup of these plants The amount in the above-ground portion of a plant exceeds that found in the root system and quantitatively[2] varies from a trace to a tenth of one per cent selenium (air-dry basis) Poisonous range plants, containing selenium, occurring on the Niobrara, Steele or Pierre shales are more poisonous to live stock, on the average, than the same plants found on the other formations listed above Whether or not, or to what extent *Stanleya bipinnata*, *Mentzelia decapetala*, *Oonopsis condensata*, *Astragalus pectinatus* and *A Grayi* are poisonous to live stock when occurring as selenium-free plants has not been determined *Xylorhiza Parryi* (woody aster) adheres so closely in Wyoming to definite shale zones that the authors have been unable to collect woody aster, selenium-free, in sufficient amounts to conclude feeding trials Out of twenty-five samples collected in various sections of the state twenty-three were found to contain varying amounts of selenium, depending upon the geological formation from which collections were made Selenium in woody aster is presumably combined with a toxic saponaceous[3] compound

---

[1] Wyoming Experiment Station Bulletin 189

Essentially the method of M Taboury, "Sur la presence accidentelle du selenium dans certains vegetaux," *Compt rend*, 195 (1932), 171

[3] A J Ewart, 'The Poisonous Action of Ingested Saponins" Council for Scientific and Industrial Research Melbourne, Australia, 50 (1931), 18

It is known that *Astragalus bisulcatus* free from selenium is poisonous to live stock, although very much less so, as brought out in this experiment Forced feeding trials demonstrated that fifty ounces of green *A bisulcatus* (blooming) selenium-free, per hundredweight of sheep failed to seriously affect an animal, whereas twenty-five ounces per hundredweight of sheep of the same plant, same stage of growth, containing selenium, produced death in a few hours

The toxic principle or principles of five out of seven of the selenium-bearing range plants (*Astragalus bisulcatus, A Grayi, A pectinatus, Oonopsis condensata, Xylorhiza Parryi*) may be extracted freely with water Similar data for *Stanleya bipinnata* and *Mentzelia decapetala* have not been obtained This physical aspect introduces a problem of economic significance because it is evident that through the annual decay of the foliage, seeds and roots of these selenium-bearing plants a considerable amount of this element goes back to the soil in a form readily available to any vegetative growth Water extracts of green *A bisulcatus* mixed with crude undecomposed Niobrara shale in experimentally controlled plats imparted to barley grown on these plats recognizable amounts of selenium Barley grown on the same shale composite without the addition of the vetch extract was found not to contain selenium

Grasses (native) growing in close proximity to type selenium-bearing range plants were found poisonous to guinea pigs when these pigs were allowed to feed on such areas

Vicia linearis, Thermopsis divaricarpa, Solidago mollis, Melilotus sp , *Iris missouriensis, Juncus balticus* and some native grasses represent a partial list of plants that have been found to contain selenium which were apparently influenced by those plants yielding soluble selenium compounds This conclusion is based upon the fact that our tests have failed to detect selenium in this same series of plants taken from uncontaminated shales It is not to be inferred that only the indicator plants listed take up selenium from the original shales The authors, however, wish to point out the unique selectivity for selenium shown by certain native plants Among the Astragali closely allied with *A bisulcatus, A Grayi* and *A pectinatus* ecologically may be mentioned *A carolinianus, A flexuosus* and *A Drummondii*, and yet careful tests have failed in detecting the presence of selenium in these last-named vetches

The following is a partial list of representative plants collected on well-defined shales found to be negative for selenium

Erigeron microlonchus Scirpus sp , Glycyrrhiza sp , Sporobolus sp , Glaux maritima Sarcobatus vermiculatus Medicago sativa, Artemisia frigida Arenaria Hookeri Sium cicutaefolium, Cicuta occidentalis, Delphinium Geyeri, Zygadenus gramineus, Senecio sp , Musineon sp , Oxytropis sp Chrysothamnus sp , Eurotia lanata, Valeriana sp and *Plantago sp*

SELENIUM POISONING

The fact that a selenium-bearing plant like *Astragalus bisulcatus* has, so far as our studies have gone, given a positive reaction for selenium when collected on either the basal, mid or top zone of a representative shale, *e g* , Steele, would sug-

NOTE *Atriplex Nuttallii* (salt bush) occurring in close proximity to the unaltered Niobrara shales has been found to contain selenium in varying amounts irrespective of other plant associations

gest that selenium is not restricted to limited areas in these shales Its original occurrence in such a comparatively few range plants further suggests the firmness with which it must be combined in the soil

There appear to be several manifestations of selenium poisoning of live stock Live stock grazing upon selenium-bearing plants may exhibit slightly different types of poisoning, depending upon the species of such plant ingested Since such variations do occur, it would seem evident that one of two conditions applies *First*, the various selenium-bearing plants may carry the element in different chemical combinations, or *second*, the selenium may be present in all plants in a similar chemical combination but the presence of other toxic substances may account for variations in the manifestations of poisoning

In Wyoming the live stock exhibiting this general type of poisoning reveal the following symptoms and lesions at autopsy The animals, particularly cattle, exhibit early in the stage of poisoning a dullness and a lack of vitality It is evident early in the stage of poisoning that there is a stasis of the gastro-intestinal tract There is considerable abdominal pain, with grunting, grating of teeth and salivation Shortly before the paralytic stage animals exhibit excitement, with a tendency to constantly wander, often aimlessly in circles The animal may or may not show impairment of vision Prior to death the animal exhibits varying degrees of paralysis, which becomes serious when it involves the swallowing mechanism In the cases observed by the authors the immediate cause of death was failure of the respiration

In general the autopsy findings of animals dying on the range of "Blind Staggers" (the term used locally to denote this type of poisoning) or of the experimental animals dying from the administration of small quantities of the sodium salt of selenious acid are in fair agreement The parenchymatous organs exhibit varying degrees of congestion, indicating a failing heart and circulation In cattle the stomachs, particularly the rumen, suggest a rather severe stasis The entire gastro-intestinal tract exhibits varying degrees of irritation, leading in some cases to hemorrhage The liver is often severely congested and the gall bladder distended with bile which may or may not exhibit normal color and consistency The bladder is usually distended with urine Whether the above conditions are due to lack of smooth muscle tone is not known Acutely poisoned animals resulting from one exclusive feeding show no marked pathology

The acute and chronic forms of poisoning mentioned above are responsible for heavy annual live stock losses in Wyoming

In a recent article in *Science* on "Selenium as an Insecticide"[1] a form of selenium poisoning is reported which would appear to be quite a different form than that noted with the selenium-bearing range plants of Wyoming The disease referred to in this article is not known to be common in this state, but where cereals, hay, etc , have produced it there is considerable evidence available which indicates that such selenium-carrying feeds were grown upon geological formations which had previously carried a stand of native selenium-bearing plants or had been contaminated by irrigation waters and rains passing over and through soils contaminated by woody aster, vetches, etc

THE BIOASSAY OF PICROTOXIN AND COCCULUS INDICUS PREPARATIONS *

BY JAMES C MUNCH AND AMELIA M PONCE [1]

Cocculus Indicus and its active principle, picrotoxin, have been used for poisoning fish, for increasing the bitter taste of beer, in "knockout drops" and externally against pediculi (17, 19, 24, 25, 27, 28) Pharmacologically, picrotoxin stimulates the medullary centers producing characteristic convulsions, slowing of the pulse (vagal), and an increase in blood pressure, which is followed by paralysis after large doses (1, 24, 25)

Because of the pharmacological and toxicological interest in picrotoxin, this investigation was undertaken with a view of developing a suitable bioassay

Chemical studies have shown that Cocculus indicus contains between 1 5 and 5 0 per cent of a non-alkaloidal neutral principle, picrotoxin (1, 3, 27) Picrotoxin has been reported to have the formula $C_{30}H_{34}O_{13}$ On dissolving in water it is supposed to split into equal parts of picrotin and picrotoxinin, which are closely related chemically and have similar actions Picrotoxinin is believed to be somewhat more potent, and some experiments suggest that picrotin, $C_{15}H_{11}O_7$ is inert on cold- and warm-blooded animals (4, 7, 14 15) The available literature has not given any definite information regarding the relative toxicity of these three products The data regarding toxicity have been compiled in Table I (1, 2, 3, 4, 5, 6, 8, 9, 12, 13, 14, 18, 20, 23, 26, 27) It is believed that when administered by mouth picrotin is eliminated partly unchanged in the urine, whereas picrotoxinin is decomposed (4) Picrotoxin is soluble in about 8 parts of alcohol or 240 parts of water (19, 25) In our experience some difficulty has been encountered in obtaining this strong a solution and our findings are in agreement with the statement that picrotoxin is slightly soluble in cold water and more soluble in hot water (19)

Chemical and toxicological studies on picrotoxin and its preparations are under way, and will be reported subsequently This communication deals only with a method of physiological assay which has been developed

BIOLOGICAL ASSAYS

(*1*) *Fish* —The use of picrotoxin as a fish poison suggests the possibility of developing a method for the bioassay of these preparations on fish However, the data reported in the literature showed so wide a range of effectiveness, and the symptoms reported did not appear to be characteristic, so no quantitative methods have been developed on fish (1, 5, 6, 9, 11, 24)

(*2*) *Crabs* —*Carcinas maenas* a European sea crab is reported to be very susceptible showing convulsions after a dose of 10 *gamma* of picrotoxin Other crustaceæ are also believed to be susceptible None of these animals were readily available and have not been studied in this connection The symptoms reported did not appear to be characteristic of picrotoxin (20, 24, 27, 29)

(*3*) *Frogs* —Qualitative tests may be conducted with picrotoxin The injection of 0 5 to 1 0 mg of picrotoxin to a 30 Gm *Rana pipiens* produced a characteristic convulsion Unfortunately cicutoxin produces a similar effect, although somewhat larger doses are required The front legs are often folded across the breast, the hind legs extended with the web of the foot tightly stretched A peculiar convulsant shriek is often heard Death does not ensue for several hours

---

* Scientific Section, A PH A , Madison meeting, 1933

[1] Department of Pharmacology, Sharp and Dohme Philadelphia Pa

The susceptibility of frogs has been found to depend on the temperature, season and species Frogs may be suitable for qualitative testing but did not appear useful for quantitative bioassays of picrotoxin and its preparations (1, 9, 10, 16, 24, 27)

(4) *Mice*—In connection with studies on the potency of soporifics, Wieland and Pulewka found that the injection of 2 4 mg of picrotoxin subcutaneously to male white mice was withstood, but that larger doses caused convulsions They injected 4 mg of picrotoxin per Kg twenty minutes after the injection of the soporific or hypnotic studied (30) Rassers (22) found that picrotoxin subcutaneously injected into mice produced an S curve response of the tail similar to that produced by morphine Our studies on the toxicity of picrotoxin subcutaneously injected into the mice were in reasonable agreement among themselves, but the absolute lethal dose varied from day to day We have therefore, studied various factors believed to affect these results

Although much of this work has been done with freshly prepared solutions, which were usually made to contain 1 mg of picrotoxin per cc in recently distilled water, solutions several months old have not been found to show any different toxicity It would appear, therefore, that aqueous solutions are stable for several months

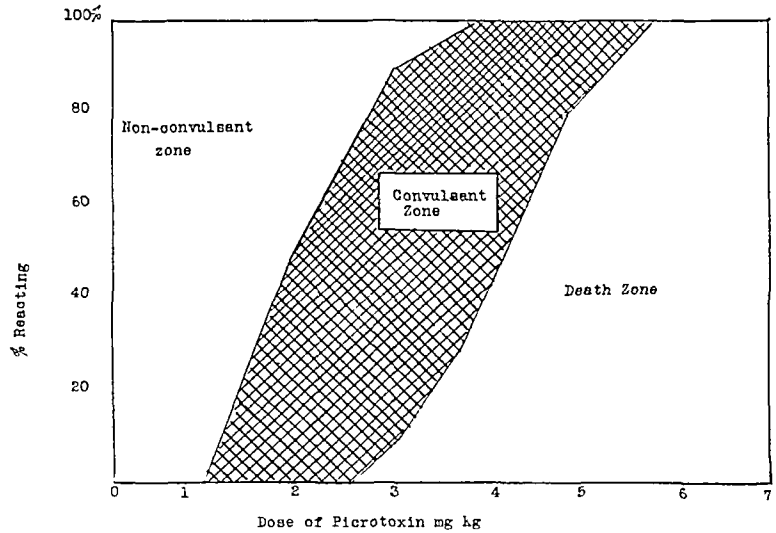

Fig 1—Effect of subcutaneous injections of Picrotoxin on mice

To avoid individual differences in mice, several hundred animals were purchased at a time from different breeders Mice were weighed to 0 5 Gm and a measured volume of solution injected under the skin of the abdomen Care was taken to prevent any loss of solution The animals were placed in cages and kept under observation for several hours to note the appearance of symptoms Very soon after injection the animals become quiet Following this, convulsions develop which are very similar to, but readily differentiated from those produced by strychnine No consistent relationship was found between the interval until the development of convulsions the period until death, and the dose administered Many mice convulse but recover The tail may show various types of curvature but does not give the characteristic S curve of morphine

In a preliminary assay, doses of 4 5 6 and 7 mg of picrotoxin per kilo and doses of 8 to 14 cc per kilo of 1 20 dilution of fluidextract (or similar dilutions of other galenicals) are injected subcutaneously into groups of five mice each The number of convulsions and of deaths are determined over a period of several hours Under certain conditions, convulsions and deaths have developed within one hour under other conditions three or four hours may be required It is difficult to specify a specific time interval, although it appears that one hour would be advisable Because of the peculiar variations in test animals both the convulsant and killing doses are considered in reaching a preliminary conclusion A desirable end point is the production of convulsions or deaths in sixty to eighty per cent of the injected animals (Fig 1)

Based upon the results of this preliminary assay, subsequent trials are made injecting groups of five mice each, in an effort to determine the dose of picrotoxin and of the unknown product which produce death in approximately eighty per cent of the injected mice within one hour ($_5LD_{80\%}$) The activity of the unknown product is then estimated in terms of picrotoxin

The results obtained in testing several samples of tincture and fluidextract of fishberries are given in Tables II and III

TABLE I —TOXICITY OF PICROTOXIN AND PICROTOXININ

Animal	Subcutaneous		Intramuscular		Oral	
	Picrotoxin	Picrotoxinin	Picrotoxin	Picrotoxinin	Picrotoxin	Picrotoxinin
Rana esculenta		1 1–2	2–10			
Doves			1 4	1 6		
Mice	2 5–6	1 6–2 0				
Guinea pigs	0 3–0 8

Cats	2 0				3 5	
Dogs	1 5–2 2	1 1	1 0			
Man					1 0–1 5	

TABLE II —CONVULSANT ACTION OF PICROTOXIN ON MICE—SUBCUTANEOUS INJECTIONS

Date	Dose Mg /Kg				
	1 0 to 1 5	2 0	2 5	3 0	3 5 to 10 0
12/27/32	0/3	1/1		1/1	5/5
1/9/33					2/2
1/16/33					1/1
1/17/33				2/2	4/4
1/18/33					1/1
1/20/33		1/1		1/1	1/1
1/24/33		0/2		1/2	4/4
1/27/33		0/2		1/2	8/8
1/30/33		2/2		2/2	2/2
1/31/33		1/1		2/2	1/1
2/1/33		0/1		1/1	2/2
2/5/33		0/1		1/1	1/1
2/6/33		0/2		2/2	3/3
		0/1		1/1	2/2
2/14/33		1/1		1/1	2/2
2/15/33		0/1		1/1	2/2
2/17/33		1/1		1/1	2/2
2/20/33		1/1		1/1	1/1
2/21/33		1/1		1/1	1/1
2/23/33		1/1		1/1	2/2
2/24/33					1/1
2/27/33		1/1		1/1	2/2
3/1/33		1/1		1/1	7/7
3/3/33	0/5		8/10	23/23	76/76
Total	0/8	12/22	8/10	46/48	133/133

This method appears promising for quantitative bioassays of picrotoxin and fishberries preparations

(5) *Rats* —A similar procedure was used in giving subcutaneous injections of picrotoxin and fishberries solution to white rats weighing between fifty and three hundred and fifty Gm although most of the test animals weighed about one hundred and fifty Gm The convulsant and lethal responses were much more erratic than those obtained in using mice Results obtained with picrotoxin injected into rats are shown in Table IV

Because of the variability of response, rats did not appear suitable for the bioassay of these products

TABLE III —THE TOXICITY OF PICROTOXIN TO MICE—SUBCUTANEOUS INJECTIONS

Date	Dose Mg /Kg 1 to 2 5	3 0	3 5	4 0	4 5	5 0	5 5	6 0 to 10
12/27/32	0/6	0/1		0/2		1/2

2/7/33	0/1	0/1				0/1		1/1
2/10/33	0/1	0/1				1/1		1/1
2/14/33	0/1	0/1				1/1		1/1
2/15/33	0/1	0/1				1/1		1/1
2/20/33	0/1	0/1				1/1		
2/21/33	0/1	0/1				1/1		
2/23/33	0/1	0/1				1/1		1/1
2/24/33						1/1		
2/27/33	0/1	0/1				1/1		1/1
3/3/33	0/1	0/1				1/1		1/1
3/6/33	0/15	16/21	5/23	6/15	7/30	4/4	6/6	5/6
8/7/33				4/10		5/10		
8/10/33				0/5		3/5		
Total	0/40	16/46	5/23	10/35	7/30	33/48	6/6	18/19

(6) *Man* —It is stated that picrotoxin has been added to beer on account of its bitter taste, and the threshold concentration reported to be bitter is 1 80 000, corresponding to 12 5 mg per liter (1 21) The results obtained in testing various concentrations are given in Table V

TABLE VI —THRESHOLD LIMEN FOR PICROTOXIN TASTE TESTS

Concentration Mg /L	Bitterness Subject 1	2	3	4	5	Remarks
5	0	0	0	0	0	
8	0	0	—	+	—	
10	0	0	0	++	0	Slightly astringent
12	0	0	—	—	—	Astringent
15	0	0	—	—	—	
20	0	0	—	—	—	
40	±	±	—	—	—	
50	+	+	—	—	—	
100	++	++	—	—	—	

In our tests on five subjects, one believed the product was definitely "bitter," whereas the other four obtained a taste which was characterized as "astringent" A peculiar numbing of the tongue develops, with various aberrations of sweet and salt tastes The taste does not appear sufficiently characteristic to justify the use of this method for bioassay

DISCUSSION

As a result of our literature studies and of our laboratory tests, we have developed the following bioassay on mice

TABLE IV —TOXICITY OF FISHBERRY PREPARATIONS TO MICE

Sample No	Product	Test	Dose Injected as 10% Tincture Cc /Kg 2 0	2 4	3 0	4 0	5 0	6 0	7 0	8 0	Picrotoxin Mg /Kg 4 0	4 5	5 0	6 0	Conclusion	Mg Picrotoxin per Cc
1	F E	1			0/2	0/3	0/2	1/4	1/2	4/4		5/10		10/10	0 8 cc = 6 mg	7 5
2	F E	1			1/5	3/5	7/10	4/5	4/5	4/5	1/2		1/2	1/1		
	F E	2				2/5	3/5				2/5		3/5		0 5 cc = 5 mg	10 0
3	F E	1			0/2	0/2	1/2	2/2			0/2		0/2	1/2		
	F E	2				1/5	5/10	8/10			4/10		6/10	5/5		
	F E	3				3/5	4/5				2/5		4/5		0 5 cc = 5 mg	10 0
4	33% Tr	1

	33% Tr	3	0/5	0/5							2/5		3/5			
											0/5		3/5		1 cc more than 5 mg	5 5
															0 8 cc less than 5 mg	
5	10% Tr	1	0/5		0/5	2/5	3/5				0/5		3/5		5 cc Tr = 5 mg	1 0

TABLE V —THE TOXICITY OF PICROTOXIN TO RATS—SUBCUTANEOUS INJECTION

Date	Dose Mg /Kg 1–2	3	4	5	6	7–10
12/27/32	0/4	1/2	2/2	2/2		4/4
4/17/33		0/5	0/5	2/5	2/3	
4/17/33			2/4	5/5		
		2/5	3/5			
Total	0/4	3/12	7/16	9/12	2/3	4/4

A large number of mice are stored under identical conditions for a sufficient time to insure uniformity Groups of five mice each are weighed to 0 5 Gm and injected subcutaneously under the skin of the abdomen with solutions of picrotoxin and of the unknown fishberry product Typical picrotoxin convulsions and/or death should develop within one hour

In a preliminary trial, doses of 4, 5, 6 and 7 mg of picrotoxin per kilo may be administered, and quantities of the fishberry product estimated to be equivalent in picrotoxin content Subsequent assays should be made, based on the results of this preliminary trial, to determine the amounts of picrotoxin and of the unknown product simultaneously injected which produce death in about eighty per cent of the injected mice As a suggested standard, 5 mg of picrotoxin is recommended

CONCLUSIONS

1 Great variations in the response of individual animals have been observed following the administration of picrotoxin and of its galenical preparations

2 By the simultaneous injection of standard picrotoxin and of a galenical subcutaneously to mice, a feasible bioassay has been developed

NATIONAL STANDARDS FOR TINCTURE DIGITALIS* WITH SPECIAL REFERENCE TO U S P X AND B P 1932 STANDARDS [1]

BY L W ROWE

A few years ago (1) experimental data were submitted showing the relation among five of the better known methods of bioassay of digitalis and the various standards proposed for these methods At that time the powdered digitalis leaf standard of the Geneva Conference had not been available long enough to permit of more than a very few comparative tests and it was only then being seriously considered by various foreign countries as a national standard for digitalis assay Since then Canada, in the Food and Drugs Act Regulations of 1928, and England, in the 1932 revision of the British Pharmacopœia, have definitely made the international powdered digitalis leaves their standard for the bioassay of digitalis Meanwhile Ouabain has continued as the U S Pharmacopœia standard for digitalis and in spite of its being illogical from the standpoint of relative degree of absorption in the short time period (one hour), as previously pointed out, the majority opinion favors its retention in the U S P XI Very recently Defandorf (2) has advocated revision of the present U S P "One-Hour Frog Method" to permit of a longer time period for more complete absorption and action of the diluted digitalis preparation which would be a valuable step forward He failed, however, to observe that a difference in degree of absorption between Ouabain and digitalis in any given time and particularly in different frogs may also influence the accuracy of the assay method

The assay methods which are official in the present U S P and B P are sufficiently different to make a comparison of the official tinctures quite difficult and added to this, the marked difference between the standards, Ouabain and International Standard Digitalis Leaves, makes a series of experimental tests the only basis of comparison This short paper presents such data accumulated since 1930 and permits a conclusion based on averages which should be approximately correct It should be stated before the assay results are tabulated that both the official B P 1932 tincture of digitalis and the standard extract of the international powdered digitalis leaves are made without defatting the drug while the U S P X tincture is made from defatted drug For some unknown reason the assay results

---

* Scientific Section, A PH A, Madison meeting 1933

[1] From the Research Laboratories of Parke Davis & Company, Detroit, Michigan

are more definite and in general the drug is found to be somewhat more active when not defatted, though tests have failed to show any appreciable activity in the fats after removal It is to be hoped that the U S P XI will not require the drug to be defatted, as it has been clearly shown that the nausea frequently caused by active digitalis preparations is of central origin, and also the presence of the fats does not contribute to the instability of the tincture with any degree of uniformity

The details of the methods of assay used in this series are available in the U S P X and the B P 1932 The Ouabain standard was the official No 626 obtained from the Food and Drug Administration in Washington The Canadian Standard digitalis leaves No 428 was obtained from Ottawa and certified that 0 85 Gm is equivalent to 1 0 Gm of International Standard digitalis leaves This correction was always made in preparing the standard extract The lot of International Standard used in this series was labeled "Standard Digitalis 1928" and was obtained from the National Institute for Medical Research, London, N W 3

SUMMARY OF ASSAYS

Method	Date	M L D or M S D	Relative Potency
		Sample International Standard Digitalis	
Lethal Frog	Sept 1932	0 0075 cc at 0 0075 cc	100% of Canad Std
Lethal Frog	Jan 1933	0 0040 cc at 0 0055 cc	137 5% of Canad Std
4 Hr Frog	Nov 1931	0 0060 cc at 0 0050 cc	83% of Canad Std
4-Hr Frog	Feb 1932	0 0040 cc at 0 0045 cc	112% of Canad Std
4-Hr Frog	Apr 1932	0 0040 cc at 0 0045 cc	112% of Canad Std
4 Hr Frog	Dec 1932	0 0060 cc at 0 0060 cc	100% of Canad Std
M S D Frog	Mar 1929	0 0080 cc at 0 0000006 Gm	110% of U S P Std
M S D Frog	Oct 1931	0 0050 cc at 0 0000005 Gm	120% of U S P Std
M S D Frog	Oct 1932	0 0060 cc at 0 00000070 Gm	140% of U S P Std
M S D Frog	Jan 1933	0 0060 cc at 0 00000070 Gm	140% of U S P Std
M S D Frog	July 1933	0 0070 cc at 0 00000060 Gm	103% of U S P Std

Cat Method	1933	Av M L D 1 19 cc /Kg	86% Hatcher Std
		Sample Ouabain U S P	
Cat Method	1929	Av M L D 0 105 mg /Kg	95% Hatcher Std
		Sample 1932 Digitalis	
Lethal Frog	Oct 1932	0 007 cc at 0 00000033 Gm	160% for Ouabain U S P
M S D Frog	Oct 1932	0 006 cc at 0 00000070 Gm	140% of U S P Std
M S D Frog	Oct 1932	0 006 cc at 0 006 (Inter Std)	100% of Inter Std
		Sample Canadian Standard Digitalis	
Lethal Frog	Aug 1928	0 0088 cc at 0 00000039 Gm	115% for Ouabain
Lethal Frog	Sept 1932	0 0075 cc at 0 0075 cc	100% of B P
Lethal Frog	Jan 1933	0 0055 cc at 0 0040 cc	73% of B P
4 Hr Frog	Nov 1931	0 0050 cc at 0 0060 cc	120% of Inter Std
4 Hr Frog	Feb 1932	0 0045 cc at 0 0040 cc	90% of Inter Std
4 Hr Frog	Apr 1932	0 0045 cc at 0 0040 cc	90% of Inter Std
4 Hr Frog	Dec 1932	0 0060 cc at 0 0060 cc	100% of Inter Std
M S D Frog	Apr 1932	0 0060 cc at 0 0000006 Gm	120% of U S P Std
M S D Frog	Apr 1932	0 0060 cc at 0 0000006 Gm	120% of U S P Std
M S D Frog	Jan 1933	0 0055 cc at 0 0000007 Gm	152% of U S P Std
M S D Frog	July 1933	0 0060 cc at 0 0000006 Gm	120% of U S P Std

DISCUSSION

Assay results by the lethal frog method, which includes also the four-hour method, show that the International Standard digitalis leaves and the Canadian Standard leaves are very nearly equal to each other in activity, as they should be An average of six tests shows the International Standard to be 107% of the Canadian Standard or that the latter is 93 5% of the former This is a close enough agreement experimentally to consider them equal

By the U S P X one-hour method and against the official Ouabain standard the International Standard tincture averages 123% of the U S P in five tests and the Canadian Standard tincture averages 128% of the U S P or nearly the same as the B P Since each of these averages contains one or two high results obtained on winter frogs (Jan 1933) it would seem that the B P and Canadian Standard tinctures of digitalis are from 20% to 25% more active than the U S P Standard tincture and that conservatively the difference might be considered as being fully 20%

By the cat method (two tests) the International Standard seems to be fully 90% of the standard proposed by Hatcher for Tincture of Digitalis but this series of tests is not large enough to prove much except that the B P 1932 Standard Tincture of Digitalis is about equal to the Hatcher Standard

CONCLUSIONS

1 The standard tincture of digitalis of the British Pharmacopœia, 1932 revision, is fully 20% more active than the U S P X Standard This difference is significant and is difficult to determine because of the recommended use of different standards and methods of bioassay

2 The B P 1932 Standard tincture and the Canadian Standard, 1928 regulations, Food and Drugs Act are equal, within the limits of experimental error of the methods of assay, as they should be

PHYTOCHEMICAL NOTES *

No 110 The Sterols from Stramonium Seed [1]

BY OLE GISVOLD

The unsaponifiable material obtained by Ralph Clark in his study of the fatty acids of stramonium seed (1) was heated under a vacuum on a water-bath for a half day It was then allowed to stand for several days in a vacuum desiccator in order to remove any traces of moisture present Ten grams of this material (2) were dissolved in sufficient alcohol to make 150 cc of solution Two and one-half grams of digitonin, Merck, were dissolved in 250 cc 90 per cent alcohol Both

* From the laboratory of Edward Kremers

[1] Scientific Section, A Ph A , Toronto meeting, 1932

solutions were heated to 65° and the digitonin solution was added to the solution of the unsaponifiable material An immediate separation of the digitonide took place The mixture was allowed to stand over night and filtered by means of suction The precipitate was suspended in alcohol, filtered off again and the precipitate washed several times with alcohol and ether

A test made with the first mother liquor gave a precipitate with digitonin Therefore, 200 cc of 1 per cent digitonin solution were added to the mother liquor in the manner previously described There was no immediate precipitate, but upon cooling the digitonide crystallized out After standing over night the precipitate was treated as previously described It is a distinct advantage to thoroughly wash the digitonide as previously described, otherwise oil will be encountered in the crystallization of the sterol As the solubility of the digitonide is only 0 014 (3) Gm in 100 cc alcohol at 18°, the loss of sterol cannot be appreciable The second mother liquor was concentrated to half its volume, when upon cooling, a third though small quantity of digitonide settled out

Dried in a desiccator the following weights of the precipitates were determined

I	2 9809 Gm	
II	1 9030 Gm	
III	0 4014 Gm	
Total	5 2853 Gm	corresponding to 1 321 Gm of sterol or 13 21 per cent of the unsaponifiable material

Precipitate No I, placed in a thimble, was extracted for ten hours with xylene by continuous percolation The xylene of the resulting solution was evaporated on a water-bath under reduced pressure The residue left in the flask was then dissolved in ether, alcohol added to the solution and the ether boiled off A small quantity of charcoal was added to the alcoholic solution and the mixture boiled gently for a few moments with continuous agitation, and then filtered The alcoholic filtrate of the sterol was reheated and just enough water added until the temporary turbidity thus produced threatened to become permanent Upon cooling beautiful opaque leaflets were obtained which upon recrystallization, melted at 134° to 135° The mother liquor yielded crystals m p at 127° to 128° The first crop of crystals was acetylated by boiling gently for one hour with an excess of acetic acid anhydride Upon recrystallization the acetate melted at 131° to 132° The acetate was saponified (4) and upon recrystallization the regenerated sterol melted at 137° to 138°

When treated according to Windaus u Hauth, the acetate gave no precipitate, indicating the absence of stigmasterol (7)

Burian's sitosterol (5) melts at 137° to 138°, its acetate at 127° to 128°

Anderson and Shriner (6) have shown that the sterol obtained from corn oil m p 137° to 138° can be resolved into γ, β and α sitosterol

Anderson and Nabenhauer (8), report a highly purified sitosterol m p 138° to 139°, the acetate melting at 130° to 131°

Digitonide precipitates II and III were combined and were subjected to the same treatment as No I The recovered sterol crystals were combined with those that had previously been obtained as a second drop of the first batch with a m p

127° to 128° because of similarity of m p The acetate obtained upon recrystallization melted at 120° to 121°

The material marked "III A" by Clark was recrystallized Beautiful almost transparent leaflets were obtained which melted at 135° Even after drying at 100° over P_2O_5 in a vacuum the melting point was not changed

The remainder of the unsaponifiable material which amounted to 53 Gm was treated with digitonin in the manner previously described The sterol thus obtained exhibited the same physical properties as that obtained before, *i e*, the free sterol melted at 138°, and the acetate melted at 131° to 132°

A mixed melting point was made with the sterol obtained from digitalis seed and no change in the melting point could be noticed Evidently the two sterols are identical

The sterol acetate was saponified with alcoholic potassium hydroxide (half normal) by refluxing for one and one-half hours The excess alkali was back titrated with half normal hydrochloric acid The values thus obtained indicate that the sterol has the composition $C_{26}H_{43}OH$

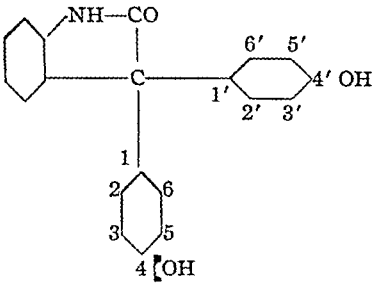
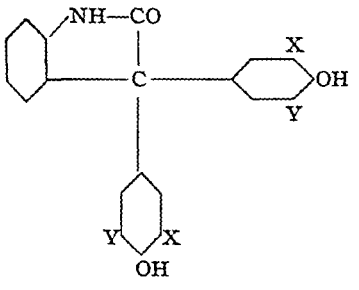
MERCURATED SUBSTITUTION PRODUCTS OF DIPHENOL ISATIN *

BY S E HARRIS AND W G CHRISTIANSEN

The results obtained during our study of mercury derivatives of phthaleins derived from *o*-hydroxy diphenyl (1) suggested that therapeutically valuable mercury compounds should be found among compounds of similar general structure Diphenol isatin (I) was selected as the parent substance for the investigation and a number of mercury derivatives of the substituted products (II) (Y = NO_2 or Br, X = H, C_6H_5, CH_3, NO_2 or Br) were prepared



(I)



(II)

* Scientific Section, A PH A Toronto meeting 1932

All of the compounds studied possessed considerable bactericidal properties and the results obtained when they were tested against *B Typhosus* in aqueous alkaline solution are shown in Table I

TABLE I

Diphenol Isatin Derivative	Highest Dilution Which Kills *B Typhosus* in 5 Minutes
Acetoxy mercuri 3,3′, 5 5′ tetrabromo	1–10,000
Diacetoxy mercuri 3 3′ dibromo	1–500
Acetoxy mercuri 3,3′ dinitro-	1–30,000
Diacetoxy mercuri 3,3′ dinitro	1–10,000
Acetoxy mercuri 3,3′ dibromo 5,5′ dimethyl	1–500
Diacetoxy mercuri 3,3′ dinitro 5 5′ dimethyl-	1–1,000
Acetoxy mercuri 3,3′ dibromo 5,5′ diphenyl-	1–1,500
Diacetoxy mercuri 3,3′ dibromo 5,5′ diphenyl	1–1,500
Diacetoxy mercuri 3,3′ dinitro 5,5′ diphenyl	1–1,000
Diacetoxy mercuri 3,3′ dibromo diresorcin isatin	1–500
Hydroxy mercuri 3,3′ dinitro diresorcin isatin	1–1,000

The preparation of the intermediates was carried out by introducing the substituent into diphenol isatin prepared by the method of Baeyer and Lazarus (2), in which one molecule of isatin is condensed with two molecules of phenol by adding a small quantity of concentrated H_2SO_4 to a mixture of the two compounds 5,5′-dimethyl- and 5,5′-diphenyl-diphenol isatin were prepared in the same manner by condensing, respectively, *o*-cresol and 2-hydroxy diphenyl with isatin It was found that diresorcin isatin could not be prepared in this way, since the high temperature required to melt the resorcin led to an extremely violent reaction with formation of tars Condensation proceeded smoothly in glacial acetic acid solution, the product being formed without the usual elimination of water between two hydroxyl groups It was subsequently observed that substitution under mild conditions, *e g*, in glacial acetic acid, bromination could be effected without closing the oxonium ring at positions 6 and 2′, whereas nitration in concentrated sulphuric acid led to the elimination of water

Mercuration was in general effected by the method previously described (1), but in a number of cases this led to the formation of mixtures of mono, di- and trimercury derivatives which we were unable to separate, the compounds being characterized by complete insolubility in organic solvents Other means of mercuration were adopted in such cases The compounds obtained were all readily soluble in a slight excess of aqueous alkali In no case was a melting point observed, the compounds decomposing without melting when heated The position of the mercury has not been determined There is ground for belief, however, that in some cases the mercury enters the isatin residue while in others it enters the phenol residue This, as in the case of the phthalein, is based on the readiness with which disubstitution occurs in certain nitro derivatives, while we have been unable to introduce a second mercury into 3,3′,5,5′-tetrabromo diphenol isatin This indicates that in acetoxy tetrabromo diphenol isatin a single mercury enters the isatin residue, and that in diacetoxy mercuri 3,3′-dinitro diphenol isatin we have mercury substitution at the 5 and 5′ positions The high-mercury analyses reported in the experimental part indicates that in the latter compound there is some formation of the triacetoxy mercuri derivative, with the third mercury entering the isatin residue

Analysis for mercury was carried out by the method of Whitmore (3), but with somewhat unsatisfactory results As stated elsewhere (1) the method of Tabern and Shelberg (4) is now used in this laboratory

EXPERIMENTAL

3,3'-Dibromo Diphenol Isatin —3 17 Gm diphenol isatin (2) was suspended in 40 cc glacial acetic acid and a solution of 3 2 Gm bromine in 10 cc glacial acetic acid added dropwise with stirring The reaction product was isolated by dilution with water, and recrystallized from benzene as a fine white powder

Melting point—144–145° C
Yield—88%
Analysis (Parr bomb) Br—Found 33 92%, 33.24% Calc for $C_{20}H_{13}NO_3Br_2$—33 83%

Diacetoxy Mercuri 3,3'-Dibromo Diphenol Isatin —General method of mercuration in alcohol solution 3 5 Gm of dibromo diphenol isatin was dissolved in 35 cc alcohol and the boiling solution treated with a solution of 4 7 Gm of mercuric acetate in 15 cc water acidified with acetic acid Stirring and boiling was continued until a side test with NaOH showed absence of ionic mercury The precipitated mercury derivative was then filtered off and washed with alcohol and ether It formed a pale yellow sandy powder insoluble in the common organic solvents, readily soluble in dilute alkalies

Yield—Quantitative
Hg—Found 41 3% Calc for $C_{24}H_{17}NO_7Br_2Hg$—42 5%

3,3',5,5'-Tetrabromo Diphenol Isatin —48 Gm diphenol isatin was suspended in 480 cc glacial acetic acid and 97 Gm bromine added dropwise with stirring The mixture was allowed to stand for an hour and then poured into 3 liters of water A fine greenish precipitate formed which was filtered off, washed with water and recrystallized from alcohol

Yield—Quantitative M p decomposes above 275° C
Br (Parr bomb)—Found 50 82%, 50 87% Calc for $C_{20}H_{13}NO_3Br_4$—50 56%

Acetoxy Mercuri 3,3',5,5'-Tetrabromo Diphenol Isatin —91 Gm tetrabromo diphenol isatin was dissolved in 144 cc 2 *N* NaOH and 150 cc of water To the boiling solution a hot solution of 46 Gm mercuric acetate in 20 cc *N* acetic acid and 150 cc of water were added, and heating and stirring continued for a few minutes after the addition was complete The mercury derivative was precipitated as a bluish gelatinous mass, to which 2 liters of water and sufficient NaOH to dissolve the product were added After filtering off a small insoluble impurity the mercury derivative was regenerated, by the addition of acetic acid, as a thick gelatinous mass, very difficult to filter and wash

Yield—Quantitative
Hg—Found 24 3% Calc for $C_{22}H_{15}NO_5Br_4Hg$—22 5%

3,3'-Dinitro Diphenol Isatin —3 17 Gm diphenol isatin was suspended in 25 cc glacial acetic acid and 1 5 cc HNO_3 (Sp Gr 1 4) was added dropwise with stirring After warming a short time on the water-bath to complete the reaction, the solution was poured into 400 cc water and the precipitate recrystallized from dilute alcohol

Yield—3 Gm M p decomposes at 225° C
N—Found 10 54%, 10 86% Calc for $C_{20}H_{18}N_3O_7$—10 37%

Diacetoxy Mercuri 3,3'-Dinitro Diphenol Isatin—Mercuration was carried out by the general method The product was a bright yellow powder

Yield—Quantitative
Hg—Found 47 1%, 48 1% Calc for $C_{24}H_{17}N_3O_{11}Hg_2$—43 5%

All methods of preparation gave products with a high and variable mercury content

Diresorcin Isatin—5 6 Gm isatin and 8 2 Gm resorcin were suspended in 50 cc glacial acetic acid, and conc H_2SO_4 added drop by drop with good stirring till the isatin color disappeared and a homogeneous solution resulted On pouring into 500 cc water and standing, a fine white powder was precipitated A suitable solvent for recrystallization was not found

Yield—6 Gm M p decomposes above 270° C						
Found	C	68 9	H	4 2	N	3 89
		68 8		4 5		4 08
Calc for $C_{20}H_{18}NO_6$	C	68 8	H	4 3	N	4 01%

3,3'-Dibromo Diresorcin Isatin—7 Gm diresorcin isatin in 50 cc glacial acetic acid was treated with 6 3 Gm bromine dissolved in 10 cc glacial acetic acid The product was isolated by dilution with water, and recrystallized from alcohol

M p 250–255° with decomposition

Diacetoxy Mercuri 3,3'-Dibromo Diresorcin Isatin—2 Gm of the dibromo compound was mercurated by the general method with 2 5 Gm mercuric acetate

Yield—90%
Hg—Found 38 4% Calc for $C_{24}H_{16}NO_6Br_2Hg_2$—39 2%

3,3'-Dinitro Diresorcin Isatin—5 Gm diresorcin isatin was dissolved in 30 cc conc H_2SO_4 and cooled to 0° C To this solution a mixture of 2 8 cc HNO_3 and 3 cc H_2SO_4 was added drop by drop, keeping the temperature at 0° C After stirring for a further period of 30 minutes the reaction mixture was diluted with 5 volumes of water, the precipitate filtered off and washed The brown reaction product was very soluble in alcohol and glacial acetic acid but did not separate in a crystalline form on evaporation or dilution It was insoluble in ether, benzene and chloroform Decomposed without melting at 220° C

Yield—Practically quantitative
N—Found 10 16%, 10 65% Calc for $C_{20}H_{12}N_4O_8$ 9 97%

Hydroxymercuri 3,3'-Dinitro Diresorcin Isatin—4 2 Gm 3,3'-dinitro diresorcin isatin was dissolved in 50 cc *N* NaOH and a hot solution of 6 Gm mercuric acetate in 25 cc water acidified with acetic acid added After standing a short time the mercury derivative was precipitated by adding dilute H_2SO_4, filtered off and washed with water, alcohol and ether

Hg—Found 32 8%, 32 0% Calc for $C_{20}H_{10}N_2O_9Hg$ 31 5%
Yield—Practically quantitative

3,3'-Diphenyl-Diphenol Isatin—20 Gm 2-hydroxy diphenyl was melted and 5 Gm isatin suspended in the molten mass, maintaining the temperature at about

60° C 2 cc conc H_2SO_4 was added dropwise and stirring continued until the reaction mixture set to a solid cake This was then broken up and boiled with water to remove traces of 2-hydroxy diphenyl The product was purified by recrystallization from alcohol and water or by solution in NaOH and reprecipitation with dilute acid It forms a white powder, m p 183–185° C

Found	C 82 3	H 4 95	N 2 87, 2 95
Calc for $C_3H_3NO_3$	C 81 9	H 4 90	N 3 00%

3,3'-Diphenyl 5,5'-Dibromo Diphenol Isatin —31 Gm 3,3'-diphenyl diphenol isatin, dissolved in 300 cc alcohol or glacial acetic acid, was treated with 20 5 Gm bromine dropwise After standing for a short time the product was isolated by dilution with 1 5 liters water, and recrystallized from dilute acetic acid

Yield—96% M p 115° C
Br—Found 27 49% Calc for $C_{30}H_{17}NO_3Br$ 26 69%

Acetoxy Mercuri 3,3'-Diphenyl 5,5'-Dibromo Diphenol Isatin —The dibromo compound on mercuration by the general method gave a brownish sandy powder in quantitative yield

Hg—Found 22 4% Calc for $C_{34}H_{23}NO_5Br\,Hg$ 22 7%

Diacetoxy Mercuri 3,3'-Dibromo 5,5'-Diphenyl Diphenol Isatin —The bromo compound was mercurated by the general method using two equivalents of mercuric acetate The properties resembled those of the mono-mercury derivative

Hg—Found 36 0% Calc for $C_{36}H_{26}NO_7Br\,Hg$ 35 1%

3,3'-Diphenyl 5,5'-Dinitro Diphenol Isatin —4 7 Gm 3,3'-diphenyl diphenol isatin was dissolved in glacial acetic acid and treated with 1 5 cc HNO_3 (Sp Gr 1 4) The product was isolated by dilution with water, and recrystallized from alcohol Yellow needles m p 148° C

Yield—Practically quantitative
N—Found 7 34% Calc for $C_{32}H_{21}N_3O_7$ 7 51%

Diacetoxy Mercuri 3,3'-Diphenyl 5,5'-Dinitro Diphenol Isatin —Mercuration by the general method gave a brown sandy powder assaying rather high for mercury

Hg—Found 44 6%, 44 0% Calc for $C_{36}H_{25}N_3O_{11}Hg$ 37 3%

As in the case of dinitro diphenol isatin, all attempts to prepare pure dimercury derivatives gave a partially trimercurated mixture

3,3'-Dimethyl 5,5'-Dibromo Diphenol Isatin —13 Gm di-*o*-cresol isatin (5) prepared in the same manner as diphenol isatin, was dissolved in 125 cc glacial acetic acid and treated with 13 Gm bromine About 30% of the product was precipitated as a micro-crystalline powder while the remainder was obtained on dilution with water Recrystallized from glacial acetic acid, it formed needles

Yield—90% M p decomposes 250° C
N—Found 2 78% Calc for $C_{32}H_{17}NO_3Br$ 2 79%

Acetoxy Mercuri 3,3'-Dimethyl 5,5'-Dibromo Diphenol Isatin —On mercuration in alcohol solution by the general method the reaction appeared to be reversible since long boiling failed to give a negative test for inorganic mercury The crude

product was freed from the unchanged isatin derivative by repeated extraction with boiling alcohol

Hg—Found 26 0% Calc for $C_{14}H_{19}NO_6Br_2Hg$ 26 4%

3,3'-Dinitro 5,5'-Dimethyl Diphenol Isatin—24 Gm di-*o*-cresol isatin (5) was dissolved in 25 cc glacial acetic acid and treated with 10 cc HNO_3 (Sp Gr 1 4) After warming on the water-bath for 15 minutes the product was precipitated by adding water and recrystallized from alcohol Yellow micro-crystalline powder m p 238–240° C

N—Found 9 68% Calc for C $H_{18}N_3O_7$ 9 65%

Diacetoxy Mercuri 3,3'-Dinitro-5,5'-Dimethyl-Diphenyl Isatin—The nitro compound when mercurated in alcohol by the general method gave a partially trimercurated product, as in the case of the other nitro derivatives

Hg—Found 44 7% Calc for $C_{14}H_{18}N_3O_9Hg_2$ 43 3%

SUMMARY

A number of new derivatives of diphenol isatin have been prepared The mercury derivatives of these compounds have been prepared and their bactericidal properties investigated

THE VALUE OF SENECIO IN MEDICINE *[1]

BY EDGAR A KELLY AND E V LYNN

In a preliminary report two years ago (3) we recorded a partial examination of senecio Since then we have completed the study and extended it to include the pharmacology

CHEMICAL

The material employed was obtained in the open market and was entirely within the official requirements, but we have no knowledge of place or time of gathering

Proximate analysis of various samples gave results as follows moisture 6 49 to 10 92 per cent, ash 8 33 to 11 85 per cent, starch, by diastase 7 85, by acid hydrolysis 10 20 per cent, tannin 6 14 per cent

---

* Scientific Section, A PH A Madison meeting 1933

[1] Research conducted under the grant of the National Conference on Pharmaceutical Research

For the purpose of complete examination, 13 Kg of the ground drug was exhausted with hot alcohol After removal of the greater part of the solvent, there was obtained 2 67 Kg of a dark, viscid mass

Volatile Oil—By steam distillation of this extract there was produced 13 6 Gm , or 0 1 per cent, of an essential oil which was acid to litmus and possessed the characteristic, aromatic and spicy odor of the drug It was light amber in color when first obtained but darkened on standing to a reddish brown color, thus exhibiting the presence of unstable compounds The oil thus changed had the following constants d_{25} 1 0072, n_D^{20} 1 4942, $[\alpha]_D$ + 27 91°, acid number 52 47, ester value 89 63 It gave no test for nitrogen or sulphur when submitted to the sodium-fusion method, the former report of finding sulphur was probably due to contaminated steam The previous refraction (1 4511) was obtained with only a few drops of oil

After rectification by steam, the oil had the following constants d_{25} 0 9862, n_D^{20} 1 4921, $[\alpha]_D$ + 40 74°, acid number 25 33, ester value 60 47 These indicated unsaturated or aromatic compounds with comparatively large amounts of free acids and some esters

Aqueous Residue—The residual, dark brown, aqueous liquid was separated from the resins and evaporated to a convenient volume under reduced pressure Repeated extraction with ether gave 25 Gm of semi-solid, from which ammonium carbonate withdrew 16 4 Gm (0 12 per cent) of oil representing free, non-volatile acids Sodium carbonate solution extracted 1 15 Gm (0 01 per cent), more than half of which crystallized in long needles melting at 129–130° C and which was probably a lactone It was soluble in benzene, ether, chloroform or hot water, but insoluble in petroleum ether or cold water, and was acid to litmus From the original ethereal extract sodium hydroxide solution removed 0 41 Gm (0 003 per cent) of phenols

From the aqueous concentrate amyl alcohol extracted 32 Gm (0 25 per cent) of a syrupy material Most of this remained liquid even after standing for several months, but there separated 0 6 Gm of a brown, amorphous powder which was apparently an anthraquinone derivative

In the remaining aqueous product, which represented chiefly sugars, nothing else beside sugars was found At no time was there any indication of glucosides and no characteristics of a saponin

The Resins—The solid portion from distillation amounted to 950 Gm or about 7 per cent of the original drug Of this black tarry mass, representing the fixed oil, phytosterol, resin, wax, etc , 18 per cent was removed by petroleum ether and subsequently 15 per cent by ether, both extracts being dark green and unctuous Chloroform extracted from the residue 14 per cent of a black, brittle solid and alcohol then removed 9 per cent of black semi-solid, these probably being chiefly wax and resin Nearly half of the original remained as a black mass

Alkaloid—In our previous report the presence of alkaloid was indicated In order to determine this more carefully a large quantity of drug was exhausted with alcohol and the latter was largely removed by distillation The residue was extracted with 2 per cent hydrochloric acid, producing a brown solution which gave copious precipitates with Wagner's or Mayer's reagents and with phosphotung-

stic acid, phosphomolybdic acid or picric acid, but none with tannic acid, Dragendorff's or Marme's reagents, platinic chloride or gold chloride

The acid solution was made alkaline and extracted with a mixture of three parts ether and one part chloroform The dried extracts were combined and evaporated to dryness, leaving a green, mobile oil corresponding to 0 006 per cent of the dried plant It was acid to litmus and possessed a bitter and burning taste

Weighed portions of the residue were tested for nitrogen by the sodium-fusion method Amounts representing as much as 600 Gm of the crude drug failed to give a positive test Since, in our hands, as little as 4 mg of strychnine will give the characteristic blue, and assuming that the proportion of nitrogen is about the same, we conclude that alkaloids are not present in senecio in amounts greater than 1 150,000

At the time this work was being conducted, Manske (4) was also testing senecio for the presence of alkaloid His results, which did not include a test for nitrogen, led him to draw doubtful conclusions

Inulin—Precipitated calcium carbonate was mixed with 600 Gm of the crude drug in order to neutralize plant acids and the mixture was introduced into an equal volume of boiling water and heated on the steam-bath After about four hours it was strained through muslin and expressed These processes were repeated three times, when the liquid was filtered until clear and the tannins, colors, etc, were precipitated with neutral lead acetate Basic lead acetate produced no more precipitate After removing the lead with sodium phosphate the filtrate was reduced to one-third its volume by evaporation under reduced pressure

Addition of an equal volume of alcohol caused precipitation of a white amorphous substance which was filtered and washed with alcohol and ether The tasteless substance, resembling starch in appearance, was insoluble in cold water and organic substances but, unlike starch, gave a clear solution in hot water After purification its solution was neutral to litmus, produced no change with iodine and did not reduce Fehling's solution After hydrolysis by boiling with dilute hydrochloric acid for one minute, however, it produced an immediate reduction of hot Fehling's solution A hydrolyzed solution gave a deep red color and a red precipitate when boiled with resorcinol in hydrochloric acid, thus proving the hydrolytic product to be a ketone sugar The specific rotation was −38 6°, of pure inulin −39 5°, of soluble starch +169 1° The hydrolytic product had a specific rotation of −95 7°, comparable to the −98 8° of levulose The original substance is thus proved to be inulin, which is present to the extent of about 7 85 per cent

While inulin is quite prevalent in plants of the composite family, this is the first instance we can find that it has been found in a senecio

The liquid from which the inulin had been precipitated was evaporated to a small volume under reduced pressure and was then allowed to stand for several weeks, being subject to some evaporation in the meantime Nothing crystalline was thus obtained and other properties of the residue would seem to indicate that glucosides are either absent or present only in very small quantities

PHARMACOLOGICAL

Attempts to isolate and identify compounds to which the reputed value could be attributed having failed, attention was next turned to the pharmacology

For the purpose of complete examination, 13 Kg of the ground drug was exhausted with hot alcohol After removal of the greater part of the solvent, there was obtained 2 67 Kg of a dark, viscid mass

Volatile Oil—By steam distillation of this extract there was produced 13 6 Gm , or 0 1 per cent, of an essential oil which was acid to litmus and possessed the characteristic, aromatic and spicy odor of the drug It was light amber in color when first obtained but darkened on standing to a reddish brown color, thus exhibiting the presence of unstable compounds The oil thus changed had the following constants d_{25} 1 0072, n_D^{20} 1 4942, $[\alpha]_D$ + 27 91°, acid number 52 47, ester value 89 63 It gave no test for nitrogen or sulphur when submitted to the sodium-fusion method, the former report of finding sulphur was probably due to contaminated steam The previous refraction (1 4511) was obtained with only a few drops of oil

After rectification by steam, the oil had the following constants d_{25} 0 9862, n_D^{20} 1 4921, $[\alpha]_D$ + 40 74°, acid number 25 33, ester value 60 47 These indicated unsaturated or aromatic compounds with comparatively large amounts of free acids and some esters

Aqueous Residue—The residual, dark brown, aqueous liquid was separated from the resins and evaporated to a convenient volume under reduced pressure Repeated extraction with ether gave 25 Gm of semi-solid, from which ammonium carbonate withdrew 16 4 Gm (0 12 per cent) of oil representing free, non-volatile acids Sodium carbonate solution extracted 1 15 Gm (0 01 per cent), more than half of which crystallized in long needles melting at 129–130° C and which was probably a lactone It was soluble in benzene, ether, chloroform or hot water, but insoluble in petroleum ether or cold water, and was acid to litmus From the original ethereal extract sodium hydroxide solution removed 0 41 Gm (0 003 per cent) of phenols

From the aqueous concentrate amyl alcohol extracted 32 Gm (0 25 per cent) of a syrupy material Most of this remained liquid even after standing for several months, but there separated 0 6 Gm of a brown, amorphous powder which was apparently an anthraquinone derivative

Alkaloid—In our previous report the presence of alkaloid was indicated In order to determine this more carefully a large quantity of drug was exhausted with alcohol and the latter was largely removed by distillation The residue was extracted with 2 per cent hydrochloric acid, producing a brown solution which gave copious precipitates with Wagner's or Mayer's reagents and with phosphotung-

stic acid, phosphomolybdic acid or picric acid, but none with tannic acid, Dragendorff's or Marme's reagents, platinic chloride or gold chloride

The acid solution was made alkaline and extracted with a mixture of three parts ether and one part chloroform The dried extracts were combined and evaporated to dryness, leaving a green, mobile oil corresponding to 0 006 per cent of the dried plant It was acid to litmus and possessed a bitter and burning taste

Weighed portions of the residue were tested for nitrogen by the sodium-fusion method Amounts representing as much as 600 Gm of the crude drug failed to give a positive test Since, in our hands, as little as 4 mg of strychnine will give the characteristic blue, and assuming that the proportion of nitrogen is about the same, we conclude that alkaloids are not present in senecio in amounts greater than 1 150,000

At the time this work was being conducted, Manske (4) was also testing senecio for the presence of alkaloid His results, which did not include a test for nitrogen, led him to draw doubtful conclusions

Inulin.—Precipitated calcium carbonate was mixed with 600 Gm of the crude drug in order to neutralize plant acids and the mixture was introduced into an equal volume of boiling water and heated on the steam-bath After about four hours it was strained through muslin and expressed These processes were repeated three times, when the liquid was filtered until clear and the tannins, colors, etc, were precipitated with neutral lead acetate Basic lead acetate produced no more precipitate After removing the lead with sodium phosphate the filtrate was reduced to one-third its volume by evaporation under reduced pressure

Addition of an equal volume of alcohol caused precipitation of a white amorphous substance which was filtered and washed with alcohol and ether The tasteless substance, resembling starch in appearance, was insoluble in cold water and organic substances but, unlike starch, gave a clear solution in hot water After purification its solution was neutral to litmus, produced no change with iodine and did not reduce Fehling's solution After hydrolysis by boiling with dilute hydrochloric acid for one minute, however, it produced an immediate reduction of hot Fehling's solution A hydrolyzed solution gave a deep red color and a red precipitate when boiled with resorcinol in hydrochloric acid, thus proving the hydrolytic product to be a ketone sugar The specific rotation was −38 6°, of pure inulin −39 5°, of soluble starch +169 1° The hydrolytic product had a specific rotation of −95 7°, comparable to the −98 8° of levulose The original substance is thus proved to be inulin, which is present to the extent of about 7 85 per cent

While inulin is quite prevalent in plants of the composite family, this is the first instance we can find that it has been found in a senecio

The liquid from which the inulin had been precipitated was evaporated to a small volume under reduced pressure and was then allowed to stand for several weeks, being subject to some evaporation in the meantime Nothing crystalline was thus obtained and other properties of the residue would seem to indicate that glucosides are either absent or present only in very small quantities

PHARMACOLOGICAL

Attempts to isolate and identify compounds to which the reputed value could be attributed having failed, attention was next turned to the pharmacology

This involved determination of toxicity, action on the excised uterus and on the uterus in a living animal

Toxicity—The animals used were two fully grown, healthy, white rats, one male and one female The fluidextract, administered orally by means of a medicine dropper, was given in increasing doses at intervals of one or two days in order that there would be no accumulation No effects were noted at any time Since the largest dose corresponded to 100 times the average for man, the fluidextract can be considered non-toxic to rats

Weighed quantities of the crude drug were mixed with glucose, rolled into pills and administered to a rabbit weighing 2406 Gm Three doses were given at intervals of two days The first, 4 Gm of senecio, corresponded to 0 17 per cent of the body weight, the second of 12 Gm to 0 5 per cent and the third of 24 Gm to 1 0 per cent In order to get the same amount of drug per Kg, the average adult person would need to ingest 700 Gm None of these enormous doses produced any outwardly evident effects and it can be concluded that senecio is entirely non-toxic

Isolated Uterine Strip—The only previous investigation of this nature on senecio was made by Pilcher in 1916 (2), who finally concluded that the fluidextract gives no constant action on the excised uterus of guinea pigs In high concentration, however, there was an indication that the drug is depressant

The animals used were adult, non-pregnant rabbits and cats The rabbit was killed by a blow on the head, the vessels in the neck were cut and the animal was rapidly bled The abdomen was opened and the entire uterus, including the ovaries and a part of the vagina, was removed to a beaker containing Ringer-Dale solution The cats were anesthetized by ether instead of being killed before bleeding

On a warm, moistened tile, one horn of the uterus was cut longitudinally with sharp scissors and, with the muscle laid flat, a segment was made 1 5 cm long and 0 5 cm wide Holes were pierced in each end to receive pieces of silk thread which were tied securely, one being attached to a muscle lever, the other to a writing lever The uterine strip, with its attached muscle lever, was then placed in a Harvard warmer containing 50 cc of Ringer-Dale solution, which was well oxygenated and maintained at about 38° C by means of an outer water-bath The jacket of the latter was a galvanized pail in the bottom of which was a hole to receive a rubber stopper A short glass tube was passed through this stopper and connected by means of a rubber tube to the muscle chamber The outer end of the glass tube was attached to a T-tube, one arm of which served as a washout for the chamber, the other being connected to a second T-tube The second arm of the latter led to the oxygen tank and the third to a reservoir of fresh saline kept at 38° C Thus, by regulating various screw clamps, the solution surrounding the muscle was kept well oxygenated and could be washed out and renewed with fresh, warm saline in a fraction of a minute The thread from the upper end of the uterine strip was attached to the short arm of a counterbalanced lever which recorded contractions by an upstroke of the writing point on a slowly moving kymograph drum

After obtaining a satisfactory normal tracing, free from spontaneous and erratic movements, the drug was added at the top of the chamber and away from the

strip by means of a graduated capillary pipette It was allowed to act for ten minutes or longer The preparation used was the official fluidextract prepared by Eli Lilly & Co containing 55 per cent of alcohol, control experiments being run with the evaporated fluidextract, with 55 per cent alcohol and with fluidextract of ergot (Lilly) The results with the evaporated preparation did not differ materially from those of the official one, while the tests with alcohol showed that this ingredient has little effect on the uterine strip The fluidextract of ergot caused the usual pronounced stimulation in all controls

The concentrations used were much higher than those which could be produced in the body If we assume that the average dose, 4 cc , be completely and rapidly absorbed, there would be about 1 17000 in the blood of an adult man In our experiments the concentrations employed were 1 1000 and 1 500

Out of a total of ten experiments using a dilution of 1 1000, rate and amplitude were increased in one and remained constant in nine The tonus was raised in two and was unchanged in eight In the three cases the rises were very small Out of nineteen experiments using the dilution 1 500, the rate was raised in five and lowered in two and the amplitude and tonus were increased in five and decreased in three Each change, however, was relatively insignificant, being in no case more than a small fraction of the alterations produced by ergot We may justifiably conclude that even very high concentrations of senecio have no action on the excised uterus

Intact Uterus —Since it is impossible to simulate outside the body the conditions which are so rigidly controlled inside the organism, the preceding experiments on excised tissue do not represent the normal effect of the drug The mode of administration and absorption of the drug, temperature control and oxygen supply and consumption are necessarily greatly changed when the organ is removed The injury involved in severing the organ from the body and from the nervous mechanism supplying it is a factor not met in studying the activity in the intact animal

The method of investigation was that of Barbour (1), using fully grown, non-pregnant cats About one hour was allowed to elapse after the operation had been completed and the apparatus had been adjusted, in order to afford sufficient time for the establishment of regular uterine movements, which were in all cases small After obtaining a satisfactory record of the normal contractions, the fluidextract was injected in doses of 0 5 cc through the cannula in the left jugular vein A control injection of 0 5 cc of fluidextract of ergot was made at the end of each experiment In all, five experiments were performed using as many animals In each fluidextract of senecio failed to change the character of the uterine movements in any respect, while fluidextract of ergot produced the characteristic stimulating action

CONCLUSIONS

Although senecio has been used in medicine for many years, chiefly in uterine disorders, we find no published evidence of any value The drug is official probably because of some considerable usage, but certainly this cannot be because of scientific proof Since immense doses of the drug give no demonstrable effects on animals, since local application to the uterus gives no action on the rate, amplitude or tone

of the uterine muscle, we are forced to the conclusion that the drug is valueless in the conditions for which it is prescribed We offer the suggestion that it be eliminated from our materia medica As long as certain physicians prescribe it, deletion from the formulary may not be deemed advisable, but it would seem logical to urge strongly abandonment of any administration

SUMMARY

A proximate analysis of senecio was made, including moisture, ash, tannins, resins, etc There was found 0 1 per cent of volatile oil whose constants are given, also about 8 per cent of inulin and no starch No evidence could be found for the presence of alkaloids or glucosides

Even with enormous doses, senecio caused no untoward effects in rats or rabbits Numerous experiments on isolated uterine muscle and on normal uterine movements in intact animals clearly demonstrated the absence of any effect on the tone, rate or amplitude of this muscle

THE ASSAY OF CAFFEINE SODIO SALICYLATE AND ELIXIR OF SODIUM SALICYLATE

BY EDWARD M HOSHALL, DONALD C GROVE AND GLENN L JENKINS

CAFFEINE SODIO-SALICYLATE

This preparation has been recommended for admission into the National Formulary VI A method of assay is proposed

Assay for Caffeine —Transfer 2 0 Gm of caffeine sodio salicylate, previously dried to constant weight at 80° C, and accurately weighed, to a 100 cc volumetric flask and make to volume with distilled water Transfer a 10 cc aliquot to a separatory funnel, add 5 cc sodium hydroxide T S and extract the caffeine with successive portions of chloroform until the residue gives no test for alkaloids with iodine (T S) Pass the chloroform solutions through a filter which has previously been moistened with chloroform and wash the stem of the funnel and filter with a few cc of the solvent to remove any adhering caffeine Evaporate the combined chloroform solutions on a water bath, and dry the residue of anhydrous caffeine to constant weight at 80° C

Assay for Sodium Salicylate —Transfer the aqueous liquid from which the caffeine has been removed by the above assay for caffeine to a 500 cc glass stoppered Erlenmeyer flask rinsing the separatory funnel with small portions of distilled water Also wash the filter and funnel used in the caffeine determination with small portions of water adding the washings to the 500-cc flask Add sufficient distilled water to make the volume in the flask about 100 cc Add 50 cc 0 1*N* Bromine solution, 10 cc of hydrochloric acid, then stopper and shake for one minute, then at intervals for thirty minutes Add 10 cc of 15 per cent potassium iodide solution, stopper and shake for five minutes Titrate the liberated iodine with 0 1*N* sodium thiosulphate solution, using starch T S as indicator

Each cc of 0 1*N* bromine is equivalent to 0 002668 Gm $NaC\ H_5O_3$

Experimental —According to National Formulary VI *Bulletin*, page 325 the formula and

directions for the preparation of caffeine sodio salicylate will be the same in the National Formulary VI, as they now are in the National Formulary V Due to the efflorescent nature of hydrated caffeine, the water content will be extremely variable as shown by W W White [1] Because of this fact it is recommended that the stable anhydrous caffeine (dried at 80° C) be used for this preparation

Accordingly the preparation was compounded by following the method as in the National Formulary *Bulletin*, page 525, substituting caffeine dried to constant weight at 80° C , for the hydrated caffeine The same sodium salicylate as used in the elixir of sodium salicylate was used The analysis appears in Table II

The preparation was then assayed by the method given above, with the following results

TABLE I

	Analyst	Amount Present Per Cent	Amount Found Per Cent.		Error Per Cent
Sodium Salicylate	A	49 82	49 71	49 74	−0 2
	B	49 82	49 64	49 67	−0 2
Caffeine (dried at 80° C)	A	50 00	50 01	49 79	−0 2
	B	50 00	49 84	49 77	−0 4

CONCLUSION

1 Suitable methods of assay for caffeine sodio-salicylate have been developed It is recommended that the assay be adopted as official in the National Formulary VI

2 It is recommended that caffeine (dried to constant weight at 80° C), be substituted for caffeine hydrated, in this preparation

3 It is recommended that the following tolerances be adopted

The preparation shall contain not less than 47 5 per cent or more than 52 5 per cent of sodium salicylate

The preparation shall contain not less than 47 5 per cent or more than 52 5 per cent of caffeine dried to constant weight at 80° C

ELIXIR SODIUM SALICYLATE

This preparation has been recommended for admission into the National Formulary VI A method of assay is proposed

Assay for Sodium Salicylate —Transfer 10 cc of the preparation to a 250 cc volumetric flask and make to volume with distilled water Transfer a 10 cc aliquot to a 500-cc glass stoppered Erlenmeyer flask, add 100 cc of distilled water, 50 cc of 0 1*N* bromine solution and 10 cc of hydrochloric acid Stopper and shake for one minute, then at intervals for thirty minutes Add 10 cc of 15 per cent potassium iodide solution, stopper and shake for 5 minutes Titrate the liberated iodine with 0 1*N* sodium thiosulphate solution, using starch T S as indicator

Each cc of 0 1*N* bromine = $(0\ 002668 \times \frac{250}{10} \times 10) = 0\ 667$ Gm NaC H_5O_3 per 100 cc of solution

Experimental —Sodium salicylate (a C P quality salt), was assayed by the above method, and also by the extraction and determination of the salicylic acid content The results are given in the following table

TABLE II

	Analyst	Assay by Proposed Method Per Cent		Assay by Determination of Salicylic Acid Per Cent.	
Sodium Salicylate	A	99 62	99 62	99 65	99 38
	B	99 76	99 52	99 66	99 57
	Average	99 63%		99 57%

Using the assayed salt and following the method of preparation of Elixir Sodium Salicylate as in the National Formulary VI *Bulletin*, the product was compounded and assayed by the method as presented above The results appear in Table III

TABLE III

	Analyst	Amount Present Gm /100 cc	Amount Found Gm /100 cc	Error Per Cent
Sodium Salicylate	A		24 77	−0 6
		24 908	24 75	
	B		24 73	−0 6
			24 74	

CONCLUSIONS

1 A suitable method of assay for Elixir of Sodium Salicylate has been developed It is recommended that the method of assay herein proposed be adopted as official in the National Formulary VI

2 It is recommended that the following tolerance be adopted for this preparation 100 cc of Elixir of Sodium Salicylate contains not less than 24 5 Gm or more than 25 5 Gm of sodium salicylate

AROMATIC ELIXIR *

BY L D HAVENHILL AND M G SMOLT

Aromatic Elixir, U S P X is an excellent vehicle and masking agent, one of the best in use to-day The junior author became interested in the study of this vehicle when large quantities of it were required by the Bell Memorial Hospital in Kansas City, Kansas, and the Watkins Memorial Hospital in Lawrence, Kansas

The difficulty in preparing this elixir is to secure a clear product The official process is long and tedious and often disappointing to the busy hospital pharmacist Several writers, Shiflett (1), Silver (2) and Burlage (3) and others have given the matter of a rapid method of preparing this elixir considerable attention, but their methods in our hands have not been entirely satisfactory

The volatile oils used in the preparation of the Compound Spirit of Orange from which the Elixir is prepared are shown in Gildemeister and Hoffman (5) to consist, with the exception of Oil of Anise, largely of terpenes which are not readily soluble in a dilute alcohol These are almost completely precipitated in the preparation of the elixir and are the chief cause of the difficulties encountered

The oxygenated principles of these oils are the desirable ones They are also not the ones which cause the cloudiness The problem resolves itself into the following

First to determine a strength of alcohol that can be used in preparing Compound Spirit of Orange that will extract sufficient oxygenated principles from the volatile oils used, but not enough of the terpenes to precipitate on dilution when preparing the aromatic elixir

Second to establish the strength of this new spirit as compared with the one now official regarding oxygenated principles

Third to ascertain the relative amounts of oxygenated principles present in Aromatic Elixir

Fourth to calculate the amount of this 'soluble Spirit necessary to make an Elixir similar in flavoring strength to the one at present official

A search through the literature yielded very little of value The articles for the most part were concerned with improving the methods of filtering or with changing the proportions of ingredients used Krantz and Carr (6) (7), in two articles recorded results using filtering agents other than talc In actual experience talc has been found to be the most satisfactory filtering medium

It is reasonable to expect that if a mixture of volatile oils is added to a diluted alcohol, two phases will result Since the mixture of oils contains oxygenated principles which are also soluble in the diluted alcohol used, an equilibrium will be established in the aldehyde strength of the two immiscible liquids The amount of oxygenated principles present in the alcoholic phase will depend on both the volume of the solution and the strength of alcohol used The amount of oxygenated principles remaining in the oil phase is lost in all methods of preparation because this phase is removed through filtration

Shiflett (1) and Silver (2) claim the products obtained by their methods are identical in strength with Aromatic Elixir, U S P because the same amounts of ingredients have been used, although both processes involve a preliminary pre-

* Section on Practical Pharmacy and Dispensing, Madison meeting 1933

cipitation of the hydrocarbon principles of the volatile oils, which are filtered out before adding the remainder of the ingredients This would lead one to think that the "order of mixing" made no difference in the strength of the finished product

Experiments were carried out which showed that the amount of oxygenated principles removed by the alcoholic liquid varies considerably with the procedure used It would seem essential, therefore, when suggesting modifications of the official process, that the quantity of oxygenated principles in the finished elixir be comparable to that in the official elixir This can only be done by assay Extensive experiments were made in an effort to get a "soluble" Compound Spirit of Orange

The method used follows

Varying amounts of Compound Spirit of Orange were introduced into a 50 cc volumetric flask and diluted to the mark with distilled water Each portion was then filtered, using talc, and portions of the filtrate used in compounding small amounts of aromatic elixir It was found that if 32 cc of Compound Spirit of Orange U S P be diluted with distilled water to 50 cc , the resulting mixture thoroughly shaken and filtered, using 10 Gm of talc, portions of the filtrate could be compounded into Aromatic Elixir giving a clear product of superior fragrance and taste, which does not require a final filtration The entire operation of compounding, using the "soluble" Compound Spirit of Orange, takes less than 5 minutes

The next step was to ascertain the strength of the oxygenated principles of the filtrate as compared with the original spirit

The method of aldehyde assay proposed by Gfeller (4) was rejected because the terpene constituents are determined as well as the oxygenated principles The method of Klebler (5) with several variations was tried and rejected because of the difficulty in securing a definite end-point in the residual titration The colorimetric methods of the A O A C (8) were also tried The sulphite-fuchsin method was rejected because the alcohol used gave a color varying with the strength of the alcohol The method using *M*-phenylene-diamine proved to be suitable and the following modification was used throughout in the subsequent determinations

Freshly prepared alcoholic solutions of *M*-phenylene-diamine hydrochloride produce no color with the minute amount of aldehydes present in ethyl alcohol (This reagent must be freshly prepared, for in a few hours it becomes badly discolored and is unfit for use) The method of comparison used was to pipette 10 cc of the alcoholic solution to be tested into a 25-cc volumetric flask and dilute to the mark with a one per cent alcoholic solution of *M*-phenylene-diamine hydrochloride The color developed was compared, using a colorimeter, with a standard solution similarly prepared To compare the amount of oxygenated principles in the Compound Spirit of Orange used, with that present in the aromatic elixir made from it, the following method was used

One and two-tenths cc of Compound Spirit of Orange were diluted to 100 cc with 95% alcohol Another portion of 1 2 cc of Compound Spirit of Orange with enough alcohol added to make 25 cc , was diluted to 100 cc with water (Procedure of the U S P X for Aromatic Elixir, minus the syrup which would cause complications with the aldehyde reagent It is believed that the presence of sugar does not materially affect the solubility of the oxygenated principles of the volatile oils) Talc was then added and the product filtered The aldehyde strengths of the two solutions were then compared by the method given Comparison was also made of the aldehyde strength of the Compound Spirit of Orange of the U S P X and the

Soluble Compound Spirit of Orange Since the amount of the Soluble Compound Spirit of Orange used in making the elixir is the amount present in the finished product, as none is lost by filtration, the volume of the "soluble" Compound Spirit of Orange required will be that which contains the same amount of oxygenated principles as is found in 1 liter of Aromatic Elixir, U S P X Careful comparisons showed that the approximately 25% alcohol dilution of the Compound Spirit of Orange, representing Aromatic Elixir, retained but 44% of the aldehyde strength of the Compound Spirit of Orange used, and that the "soluble" Compound Spirit of Orange had an aldehyde content of but 33% of that of the Compound Spirit of Orange By simple calculation it is evident that approximately 16 cc per liter of the soluble Compound Spirit of Orange must be used to duplicate the aldehyde strength of the present official aromatic elixir

The following formulas are offered for preparing a "soluble" Compound Spirit of Orange from the official spirit, for use in making aromatic elixir

SOLUBLE COMPOUND SPIRIT OF ORANGE

Compound Spirit of Orange U S P X	640 cc
Talc	30 Gm
Distilled water	365 cc

Mix the liquids in a large separatory funnel Shake thoroughly and allow to stand one half hour Draw off the cloudy lower liquid, thoroughly mix it with the talc and filter in the approved manner to secure a clear filtrate and to restrict evaporation

If the use of the oils is preferred to the Compound Spirit of Orange, the following formula is suggested for making the "soluble" Compound Spirit of Orange

SOLUBLE COMPOUND SPIRIT OF ORANGE

Oil of Orange	128 cc
Oil of Lemon	32 cc
Oil of Coriander	12 8 cc
Oil of Anise	3 2 cc
Alcohol	465 cc
Water	370 cc
Talc	30 Gm
To make about	750 cc of "soluble" Compound Spirit of Orange

Mix the liquids thoroughly in a separatory funnel of suitable size Allow to stand for one half hour Draw off the cloudy lower liquid, mix it with the talc and filter in the approved manner to secure a clear filtrate and to restrict evaporation

The chief use of Compound Spirit of Orange is for preparing Aromatic Elixir In a few instances it is used in prescription compounding for flavoring It is believed that this "soluble" compound spirit of orange will prove to be an unobjectionable substitute and much more suitable for use in flavoring medicinals which are low in alcoholic strength

The following formula is offered for an aromatic elixir which meets the U S P X requirements, using the "soluble" Compound Spirit of Orange

AROMATIC ELIXIR

Compound Spirit of Orange, soluble	16 cc
Syrup	375 cc
Alcohol	250 cc
Distilled water	380 cc
To make about	1000 cc

Mix the soluble compound spirit of orange with the alcohol Add the syrup in small portions, mixing well after each addition, then in like manner add the distilled water (The product at this stage is full of minute bubbles, but clears in a few minutes)

A STUDY OF VEHICLES FOR MEDICINES *

BY BERNARD FANTUS, H A DYNIEWICZ AND J M DYNIEWICZ

III ELIXIR OF PHENOBARBITAL

If the slogan "Every N F preparation a pharmaceutic masterpiece" be adopted, it ought to add immeasurably to the prestige and popularity of its formulas with the medical profession It may take quite some time to rectify the errors of omission in this respect in the old formulas of this Book, many of which, all will agree, could be improved We should, however, scrutinize all new formulas that seek admission to this publication from that standpoint Without pretending to crown the formula we are about to propose as "a masterpiece,"—it is not for us to pronounce it as such—we would like to submit it in competition with other formulas for consideration, most especially, from the standpoint of palatability

The principle underlying the elaboration of this formula is best illustrated by the following experiment

1 0 030 Gm of Phenobarbital dissolved in 15 cc of alcohol (95%)
2 0 030 Gm of Phenobarbital dissolved in 15 cc of dilute alcohol (50%)
3 0 030 Gm of Phenobarbital dissolved in 15 cc of 25% alcohol

It will be found that the taste of Solution 3 is much more bitter than that of Solutions 2 and 1 Of course, Solution 1 is unpleasantly strong in alcohol, and, therefore, one does not hesitate in deciding that Solution 2 gives the best result The reason for the lower degree of bitterness of the stronger alcoholic solution over the weaker, evidently lies in the physical fact that *a substance will not exchange a good solvent for a poor solvent* Inasmuch as phenobarbital is so much more soluble

* From the Laboratory of Pharmacology of the University of Illinois

alcohol than in water, the 50% alcohol is a much better solvent than is the 25% alcohol and the saliva-saturated mucosa of the tongue and palate is a still poorer solvent If one desires to test in this case, the validity of the proposition that "*the best solvent is the best vehicle*" all one needs to do is to dilute the solution resulting from Experiment 2 with water, which immediately brings out a great bitterness Therefore, when the dose is given in this way, it should not be diluted with water

We secured a rather "delicious" preparation, tasting more like a "liqueur" than medicine, by dissolving a 0 015 Gm dose of phenobarbital per teaspoonful of 2 parts of "aqueous elixir" to 1 part of "alcoholic elixir " This mixture of solvent would carry even 0 03 Gm per teaspoonful, but the resulting solution becomes quite bitter It might be prepared extemporaneously by dissolving the active agent in a mixture of aqueous and alcoholic elixirs, the formulas for which have been previously submitted (article II of this series) It might seem best, however, to present the following formula for its direct preparation

ELIXIR PHENOBARBITAL

Elixir of Phenobarbital

Elix Phenobarb

Phenobarbital	3 75 Gm
Gluside	1 5 Gm
Compound Spirit of Orange	7 0 cc
Alcohol	300 0 cc
Glycerin	200 0 cc
Water	410 0 cc
Sucrose	170 0 Gm
Tincture of Cudbear	6 0 cc

Add the compound spirit of orange to the previously mixed solvents Agitate and permit to stand for 24 hours, with occasional agitation Filter through a hard filter and dissolve the phenobarbital, gluside and tincture of cudbear in the filtrate and finally the sucrose either by solution or percolation and add enough of the mixed solvents to make the product measure 1000 cc

CONCLUSIONS

1 An elixir of phenobarbital should be of rather high alcoholic strength, approximately 30%

2 The dose should not be diluted before taking, as dilution brings out the bitterness

3 A formula is offered for comparison with others submitted

4 If the formula be adopted, it might be prepared either directly as stated, or else indirectly by dissolving the required dose in a mixture of 2 parts of the "aqueous" to 1 part of the "alcoholic elixir," the formulas for which have been previously submitted

IV — ELIXIR OF AMIDOPYRINE

In constructing a formula for an Elixir of Amidopyrine that might be as palatable as possible, we have tried the following vehicles, dissolving 0 150 Gm ($2^1/_2$ gr) of amidopyrine per teaspoonful, which is one-half of the official average dose

Aromatic Elixir
Iso alcoholic Elixir, 50%
Compound Elixir of Taraxacum
Elixir of Glycyrrhiza
Elixir Bitter Almond Comp —made with 50% alcohol
An Alkaline Elixir of Eriodictyon—made with 50% alcohol
Syrup of Glycyrrhiza
Aromatic Syrup of Eriodictyon

In comparing the tastes of these preparations it seems evident to us that the alcoholic vehicles are better than the aqueous vehicles, and that the stronger alcoholic vehicles are superior to those weaker in alcohol This is as might be expected from the fact that the amidopyrine is much more soluble in alcohol than in water, and it might serve as another illustration of the proposition that "the best solvent is the best vehicle "

In comparing elixirs of analogous alcohol concentration, we find that an alkaline elixir of eriodictyon made with 50% alcohol provides by far the best disguise, subduing the bitterness to a greater extent than any of the others That this is not merely due to solvent power is evidenced from the fact that the bitterness is not brought out by dilution, as does occur when the previously proposed Elixir of Phenobarbital (4th Communication) is diluted with water It must, therefore, be due to specific adsorption of the amidopyrine by the eriodictyon resin

We have proof, by test-tube experiments, that such adsorption actually occurs When we add 1 cc of fluidextract of eriodictyon to portions of 5 cc and 10 cc of a solution of 1 1000 of amidopyrine, we obtain a colloidal precipitate which is very difficult to remove from the liquid After clarification with dilute sulphuric acid, it is readily demonstrated by means of Mayer's Reagent that about nine-tenths of the amidopyrine has been taken out of solution We therefore know that eriodictyon resin combines with amidopyrine That this combination will be active in the system is made evident by the fact that the precipitate dissolves in *N*/100 HCl, which is about one-fifth the hydrochloric acid strength of the average gastric juice

We, therefore, respectfully submit the following formula for consideration for possible admission to the National Formulary

ELIXIR AMIDOPYRINÆ

Elixir of Amidopyrine

Elix Amidopyrin

Oil of Bitter Almond	0 5 cc
Vanillin	1 0 Gm
Gluside	1 5 Gm
Amidopyrine	37 5 Gm
Fluidextract of Eriodictyon	30 0 cc
Solution of Potassium Hydroxide	27 5 cc
Alcohol	500 0 cc
Syrup	350 0 cc
Orange Flower Water, a sufficient quantity,	
To make	1000.0 cc

Dissolve the oil of bitter almond, the vanillin and the gluside in the alcohol, then add the syrup Mix Dissolve the amidopyrine in the above solution

Mix the fluidextract of eriodictyon and the potassium hydroxide solution, add it to the amidopyrine solution and mix Finally add enough orange flower water to make 1000 cc

The above given formula has been constructed with the N F Elixir of Bitter Almond as a basis, this having been selected because bitter almond is in itself a good disguise for the bitter taste We have fortified the elixir by the addition of fluidextract of eriodictyon because of its power of disguising alkaloids and similar bodies, such as amidopyrine The quantity of fluidextract of eriodictyon has been chosen at the maximum that will still be pleasant A greater proportion would develop the inherently unpleasant taste of the yerba santa to an offensive degree The addition of the potassium hydroxide is necessary to secure a clear solution

We believe that an elixir of the composition elaborated for the disguise of the amidopyrine might also be useful for other similar medicines We, therefore, would like to submit the following formula for consideration as a possibly useful strongly alcoholic vehicle for alkaloids

ELIXIR ERIODICTYI ALKALINUM

Alkaline Elixir of Eriodictyon

Elix Eriodict Alkal

Oil of Bitter Almond	0 5 cc
Vanillin	1 0 Gm
Gluside	1 5 Gm
Fluidextract of Eriodictyon	30 0 cc
Solution of Potassium Hydroxide	27 5 cc
Alcohol	500 0 cc
Syrup	350 0 cc
Orange Flower Water, a sufficient quantity	
To make	1000 0 cc

Dissolve the oil of bitter almond the vanillin and the gluside in the alcohol, then add the syrup Mix

Mix the fluidextract of eriodictyon and the potassium hydroxide solution and add to the above solution Finally, add enough orange flower water to make 1000 cc

In suggesting the desirability of introducing this elixir of eriodictyon, we would like to point out that we have not reversed our opinion regarding the desirability of deleting the now official elixir We recommend this deletion because the "Aromatic Elixir of Eriodictyon" is practically not prescribed at all It is a most unstable preparation in that it precipitates continually It is an irrational preparation in that a considerable and undeterminable proportion of the active disguising principle of eriodictyon, the resin, is unceremoniously filtered out It also suffers from a redundancy of ingredients, containing as many as thirteen, several of them without any good and sufficient reason or advantage We found that the official elixir contains neither enough alcohol nor of the resin of eriodictyon to give nearly as satisfactory a result in disguising of amidopyrine as the above

proposed elixir, for which the name "Alkaline Elixir of Eriodictyon" might be suggested in order to distinguish it from the elixir at present official

CONCLUSIONS

1 An elixir of amidopyrine should be a strongly alcoholic elixir, about 50%, because amidopyrine is more soluble in alcohol than in water

2 The presence of eriodictyon resin in alkaline solution greatly increases, by adsorption of the amidopyrine, the disguising power of an elixir intended to carry it

3 An elixir of eriodictyon which serves so admirably as a vehicle for this alkaloid-like body, might also be useful as a vehicle for other similar agents, and its consideration for possible inclusion in the National Formulary, under the title "Alkaline Elixir of Eriodictyon," is suggested

THE NEW YORK STATE PHARMACY SYLLABUS *

BY C W BALLARD, PHAR D , PH D

The Pharmacy Law of New York State provides for the granting of four degrees in pharmacy The graduate in pharmacy, Ph G , is conferred upon the completion of a three-year course with a minimum of 750 hours yearly, the pharmaceutical chemist, Ph Ch , a three-year course of 1000 hours yearly, the bachelor of science in pharmacy, B S Phar , was originally a four-year course of 1000 hours yearly but is now on a semester-hour basis with a minimum of 3600 clock hours, the doctor of pharmacy, Phar D , representing two years of graduate study subsequent to the attainment of the bachelor's degree Graduates of both three-year courses are eligible for licensing before the Board of Pharmacy

The recently issued Pharmaceutical Syllabus IV contemplates a four-year course and is manifestly not applicable to a course of three years' duration In view of this situation the New York State Education Department has prepared a three-year schedule and syllabus which represents a modification of the Pharmaceutical Syllabus IV The four-year course, in operation for several years in New York State, is retained and the National Syllabus might have been adopted for this course if it had fulfilled the requirements of the Education Department for the bachelor's degree The specifications adopted for this four-year course may be briefly stated as follows 1 It must include all the subjects and hour allotments of the three-year course, 2 It must include a minimum of 3600 clock hours instruction over four calendar years, 3 The division of subjects shall approximately represent fifty per cent each of professional and nonprofessional work, 4 The course shall extend over five days weekly in each calendar year These requirements, especially the second, necessitated the preparation of a statement of the hours and subjects to be required in both the three- and four-year courses This syllabus

* Section on Education and Legislation A PH A Madison meeting, 1933

has now been published and will presumably be in effect with classes entering in September 1933

There are naturally many points of similarity in the two syllabi and the major points of difference are due to the specifications previously mentioned The New York Syllabus adopts three primary divisions of subjects—professional, required academic and required electives as contrasted with the professional or applied and basic groups of the National Syllabus Certain subjects included in the basic group of the National Syllabus and therefore without detailed statements of the content of the course, are considered as professional subjects in the New York Syllabus and teaching outlines are provided The subjects are botany, physiology and first aid and elementary physics together with general, inorganic, qualitative, quantitative and organic chemistry In the New York Syllabus there is a frequent grouping or bulking of time for several related subjects thereby permitting the instructor to apportion the time for each as he sees fit Every subject listed in the New York Syllabus is required but in the history and elective science groups maximum and minimum limits are stated In the New York Syllabus the requirements are stated in terms of didactic, laboratory and semester hours excepting in zoology, college physics, bacteriology and elective science which are stated in terms of semester hours or points As regards total time for the courses, the National Syllabus provides for a four-year course with a minimum of 3000 hours, 2336 of required subjects and 664 of optional subjects while the New York Syllabus for the corresponding course requires a minimum of 168 5 semester hours and states a maximum of 183 5 semester hours Obviously the conversion of semester hours to clock hours depends upon the amounts of didactic and laboratory instruction, but the minimum of 168 5 semester hours is to be equivalent to 3600 clock hours

The requirements of these two Syllabi, as regards subjects and time allotments, are presented in the following tabulation It has not been possible to follow the arrangement of either syllabus in compiling this data but it will serve for general purposes of comparison

JOHN TENNENT AND SENECA RATTLESNAKE ROOT *

BY RALPH BIENFANG [1]

"Traduced, circumvented and at last betrayed bereft of every consolation, save that of conscious integrity, and a distant hope derived therefrom I take this method of submitting myself to the determination of the public, in confidence of

* Section on Historical Pharmacy, A PH A, Madison meeting, 1933

[1] From a thesis submitted in partial fulfilment of the requirements for the Ph D degree, Univ of Wisconsin, 1929

obtaining a sentence agreeable to its usual candour, and suitable to my own deservings, as they shall occur in the subsequent narrative "

Truly a sad statement, but one to be expected since the author was in jail, awaiting trial for bigamy It was written by John Tennent, discoverer of the use of Seneca rattlesnake root in the cure of pleurisy, as he sat behind bars in the Old Bailey in London in 1742 Jail was not new to Tennent at this time, but let us take up his life where we have the first notice of him

He bobbed up in Virginia about the year 1728, purporting to have come from Scotland In the colony, he engaged in the practice of medicine without, however, being in possession of a medical degree Apparently, he lived a rather unobtrusive life there until 1736 In that year he published in Williamsburg an "Essay on the Pleurisy," announcing his discovery of the use of Seneca rattlesnake root in the cure of pleurisy, and giving at great length the reasons for his coming to the conclusion of its value in that disease Up to this time, Seneca rattlesnake root had been known only as an Indian remedy for snake bite, it being a very common practice for Braves to carry some of the powdered root in a pouch at the waist for emergency use Tennent noticed, as he says, a similarity in the symptoms caused by snake bite and by pleurisy, and was actuated by these observations to make use of the root in his pleuritic cases

His own words were

> Again as I have observed before, since we are to infer the sameness of causes from the likeness of effects, there is another reason why it should be done in this case, and that is that those who have the misfortune to be bit by a rattlesnake, do spit up blood and cough like pleuritic patients therefore it is beyond all controversy, that the blood of a pleuritic patient, and that of one bit by a rattlesnake is in the same state or very near it Upon this certainty of reasoning, I gave the rattlesnake root to several patients in a pleurisy or peripneumony, and its effects were extraordinary I found it to exceed the volatile salt of vipers, or anything that I ever knew given in that disease In short it may justly be deemed a *Certain Remedy* "

Tennent also made use of the columns of the *Virginia Gazette*, a weekly of that time, in the furthering of his discovery This, however, seemed to be too great an affront to the regular physicians of the colony, who proceeded to ridicule his reasoning under a pseudonym in the same paper This went on for about two years, during which time, Tennent made several trips to London

On his first, he took the "Dorsetshire," leaving June 26, 1737 Through recommendations from friends in Virginia, he was able to get an interview with Doctors Tho Pellet, R Mead and Jo Monro These men after hearing his story, recommended him for the degree of Doctor in Physic at the University of Edinburgh This degree he never received, but we have it in his own words that the worth of the practitioner is of the greater importance

Tennent seems to have been a little overzealous in putting up a front in London for soon he was involved in debt He returned to Virginia and petitioned the House of Burgesses for a reward for having made public his discovery This body's first action was refusal, but later it reconsidered, and Tennent was voted the sum of £100 He had expected at least £1000 and was quite disappointed Real disappointment came when two of his American creditors, Charles Carter and Messrs Hanner & King, appealed to the House for the reward and got it

Tennent then managed to return to London There he proceeded to become

more deeply involved in debt, and during this time had as his common law wife, Elizabeth Cary Seeking a way out of his financial difficulties, he appealed to Lord Cathcart for the appointment as Physician General to His Majesties Forces in the West Indies He recommended himself on the strength of his knowledge of the diseases of the country He failed in this, and his offer to go as assistant to the Physician General was likewise refused

Now, Tennent had arrived at a position where he would either have to go to jail or leave England, and it was at this crucial time that a friend, Mr Christian, suggested to him that he marry a lady of fortune, and thus recover his position Tennent took to this suggestion gladly The desired woman was found in Mrs Hanger, a widow of some circumstance, who possessed among other things, an annuity of £50 The marriage was arranged for and took place at St James Church on Sunday, November 8, 1741, the service being read by Reverend Mr Fisher

Three weeks after the marriage, Tennent was lodged in jail for non-payment of debts He managed to borrow enough to satisfy his creditors, and so was released Soon after, he was incarcerated again, and this time after getting out, he made an unsuccessful attempt to sell Mrs Tennent's annuity Again arrested, for not paying a debt of £12, and again released, he found upon returning home that his wife had left him, quite probably on the advice of one of her brothers, Mr Parrat, an attorney-at-law, who couldn't stomach among other things, the attempted sale of his sister's annuity

Distracted, Tennent fled to Scotland, but Mr Parrat apparently had not finished with him The facts of his common law marriage were uncovered, and on June 8, 1742, a warrant was granted for the seizure of Tennent wherever he resided Consequently, he was brought back, and it was after he had been indicted, and was awaiting trial in his cell in the Old Bailey, that he aired his case in a printed pamphlet

Here the picture dims, and then it ends, with a simple notice in the *Gentleman's Magazine* of Tennent's death in London, on October 27, 1748

HISTORICAL PHARMACY IN MINNESOTA *

BY FREDERICK J WULLING

In its seventy-five years of statehood Minnesota has done very well in the recording of historic matters The Territorial Pioneers organized themselves long ago and the Minnesota Historical Society came into being in territorial days way back in 1849 Later with state aid a half million dollar building for collecting and preserving authentic records of historic interest and value was erected for the

* Section on Historical Pharmacy, A PH A , Madison meeting, 1933

Society Histories of many of the cities and counties of the state have been written and some published, not a few in book form, and recently Dr William Watts Folwell, the first president of the University of Minnesota, in the period during which he enjoyed the honor of the *Emeritus* presidency wrote an exhaustive four-volume history of the state, which no doubt will always remain an authoritative historical reference for the period it covers Much could be said of the work and accomplishments of the State Historical Society, but it is my purpose only to convey the fact that Minnesota is fairly well off in recorded historical material

For many years now I have made periodical researches into this material and although I often searched especially for facts of pharmaceutical interest, the field was found almost barren Here and there a local historian mentions a drug store Until very recently I have not found a pharmacist among those who have written historical articles or records relating to Minnesota

This fact and my long association with pharmacists, physicians, dentists and scientists in other fields, led me to the conclusion that the type of mind represented by scientists is not greatly interested in history and that as far as pharmacy is concerned a wider interest in history, at least in its pharmaceutical aspect, should be aroused

As a result of this conviction the Historical Committee of the Minnesota State Pharmaceutical Association was created a few years ago, that is, the members did not object to the addition of another committee to the list of other practically inactive committees The next endeavor was to make the committee effective Charles T Heller, well-known pharmacist of St Paul, who was the committee chairman, was the only productive member However, the seed was sown to arouse a history consciousness among pharmacists Now after several years of preliminary and preparatory work this committee has been enlarged to represent the various divisions of the state Possibly to reward or punish me, neither of which I deserve for my persistency in the matter, I have been made chairman of the committee

It is now certain the committee will do some worth-while work It will be organized toward that end While I have some definite plans to produce effective results, suggestions likely to increase the efficiency of such a committee are invited from my hearers or readers

It would take too much space to repeat all of the instruction and advice given to committee members, but the essential things every member is especially asked to do are to connect events with exact dates, names and localities, get corroborative evidence wherever possible and write down every detail available concerning any event, item or thing of pharmaceutic interest, leaving it to the skilled historian to decide what is essential to select for a representative record

The committee already has the promise of cooperation of the Minnesota Historical Society and one of the joint objectives is the reproduction of a pioneer drug store in the Historical Building

The College of Pharmacy already possesses the nucleus of a pharmaceutical museum, which is slowly developing through acquisition of items purchased out of the proceeds of the Wulling Fund established for that purpose The College, too, will cooperate with the Historical Society and with the Association committee The museum recently acquired what was represented as the counter scale used in

the first or in one of the first pioneer drug stores in Minnesota The scale is still in fairly good condition and may be placed in the proposed pioneer drug store reproduction There are also available in the museum old medicine saddle bags used over a hundred years ago, a blood letting instrument, old wooden iron and brass mortars, plaster irons, four very old show globes, drug and spice grinders, infusion pots, drug jars, old engravings, etc The museum has just acquired a Chinese medicine cooker over three hundred years old and now very rare Negotiations are under way for the acquisition of an old sailing vessel's medicine chest

Work of this sort is no doubt being done in other states or sections of the country If similar agencies could be organized and be made to work in every state, coming historians would feel grateful, not to speak of the real service that would thus be assured pharmacy in general It could well come within the province of this Historical Section of the A PH A to advocate and stimulate such activities in every state

Lithuania —In towns pharmacies must be kept open until 9 00 P M , and if there are several pharmacies in a locality the night service is fixed by rota from 9 00 P M to 9 00 A M Country pharmacies must be open from 9 00 A M to 1 00 P M , and from 3 00 P M to 7 00 P M When a pharmacy is closed, a notice must be affixed to the door to indicate the nearest pharmacy which is open

---

PHARMACOPŒIAL SECTION OF THE PAN-AMERICAN MEDICAL ASSOCIATION

BY LEWIS W FETZGER, PH D , M D *

In the past several years there have been a number of serious attempts to get up some enthusiasm on certain methods for rehabilitating the spirit of coöperation which prevailed between the medical and pharmaceutical fraternities in years gone by

Last year a number of forward-looking leaders in pharmacy and medicine met during the Congress of the Pan-American Medical Association, in the city of Dallas, Texas, in an effort to bring about a frank expression of opinion as to the need and feasibility of a section devoted to drugs, with especial reference to the kinds which are in use in the North American and Latin American countries This was done in the hope that by starting persons thinking about the matter there may be something actually accomplished in the perpetuation of an organization that may eventually be a permanent and distinctly helpful enterprise

These discussions served to show how little attention had been paid to the relationship of the pharmacists' problems to those of the medical fraternity Each profession made a cult out of its respective endeavors, and has treated it as a sacred and highly protected constituency The discussions, to say the least, opened the way for a line of inquiry that would be most interesting and productive

The gap between the medical and pharmaceutical professions is more a spurious one than real When present the gap is a very narrow one and shows itself chiefly in the attitude of mind due to a lack of a suitable vehicle for the interchange of thought

The Pan American Medical Association expresses the idea of the mutual relationship and the interdependence of the professions which aid medicine in pushing forward the boundaries for more exact knowledge Its effort in that field is a give and take process in which any one of the participants may often receive quite as much as it gives

Commensality will be the rule for the next Congress It will be a "Floating Congress" aboard the S S Pennsylvania The itinerary, requiring sixteen days, March 14 to 30 1934 will include Havana, Colon, Cartagena, Puerto Cabello, La Guaira and San Juan The idea is novel in many respects, and it is reciprocal in that it brings the Congress to the very doorsteps of our Latin-American brethren

This represents the finest type of correlation, and we need have no fear of the outcome

Theodore J Bradley was in charge of the Section on Pharmacopœias at the Dallas meeting

* Chairman, Section on Pharmacopœias, Pan-American Medical Association

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P EDITOR OF THIS DEPARTMENT

Editor's Note The following paper by Prof Edward P Claus presents a method of teaching microscopical pharmacognosy that will make a subject that, to some, is dry, uninteresting and impractical, become interesting, instructive and enjoyable I am fully aware of the fact that botanists will not agree with me that microscopical pharmacognosy may be what I have implied, but personal experience tinges my views I am also aware of the fact that I have no authority to criticize the teaching of subjects outside of my field, but if all students including those that may have special interest for the subject, must take certain courses, then it is our duty to make them as interesting as possible A dry subject may become intensely interesting in the hands of a good teacher and a live one may lose all interest in the hands of a poor teacher The paper by Prof Claus will be helpful to teachers of pharmacognosy —C B JORDAN, *Editor*

MICROSCOPICAL PHARMACOGNOSY

BY EDWARD P CLAUS *

Dr L K Darbaker has not given me his original paper on this subject, but since his ideas embody our teaching plan, I shall try to relay to you some of his thoughts

In the Pittsburgh College of Pharmacy, School of Pharmacy, University of Pittsburgh, the student in the freshman year studies biology, in the second year microscopy and in the third year, histological pharmacognosy He has a distinct advantage in these studies by performing practical work in the same laboratory for these subjects under the guidance of the same group of instructors The work has been correlated in such a manner that one course is related directly to the next

The members of our department feel that when the average student enters college, in no matter which field, he is more or less ill at ease, nervous and easily discouraged due to the extreme change in environment In consideration of these factors, we believe that the best method of beginning instruction in biology is the laboratory study of plant specimens with which the student is familiar, particularly, members of the spermatophytes which he sees practically every day This procedure is in direct contrast to the usual method of study from the taxonomical viewpoint, from the lowest to the highest forms However, we feel that, given something he can identify and examine easily, the student's first few days are made more pleasant, and his attention and interest are stimulated A field aster, a morning glory flower, bean seedlings and corn seedlings, for the first few laboratory hours, followed by more complex spermatophyte forms, then members of the pteridophytes, bryophytes and thallophytes, interspersed with simple experiments on growing plants constitute the first semester's work Living material is used whenever possible Microscopical work is not considered except if important structures or tissues are to be seen, and then the microscopical slides are under the direct supervision of the instructor in charge During the freshman year, the student is directed in the proper method of collecting, drying and mounting of botanical speci

* Bacteriology and Pharmacognosy, School of Pharmacy, University of Pittsburgh

mens, particularly of plant drugs, is encouraged to start an herbarium, and is given opportunity to enlarge this collection throughout his school career Last year a number of our students displayed such mounts of medicinal plants in drug store windows during pharmacy week The second half of the biology course is devoted to zoology in the same anatomical manner, from the higher, more familiar forms to the lower forms, macroscopic work only being considered Field work, museum trips and trips to the medicinal plant garden are essential parts of the biology course

The second year microscopy work first considers the microscopical animals, completing the zoology course, and then microscopical plants, of the algæ and fungi groups Hence, this particular part of the work might be termed microbiology, with the exception that bacteriology proper is not touched upon in laboratory until the student's senior year After the student has completed the microscopical botany course, observing single-celled plants as gleocapsa, pleurococcus and the like, the next natural step is the simplest cell of the higher plants, the parenchyma cell This relationship is stressed, comparisons being made in the manner of structure, functions, reproduction, etc From this point on through, the sophomore year might be termed elementary histological pharmacognosy, since in each laboratory period, the student learns of new cells and tissues, and of official plant drugs in which these cells and tissues are found Instruction is given in the preparing, sectioning, staining and mounting of plant drugs A study of starches, crystals, cell contents and fibrovascular bundles is also considered

The third year histological pharmacognosy course enables the student to study how the various combinations of cells and tissues constitute the various plant parts He studies the official plant drugs in groups *i e*, barks, woods, roots, rhizomes, leaves, flowers, seeds, fruits, etc Then, since he has a thorough knowledge of each individual cell, he can readily identify the plant part and tissues present in, for instance, a section of Apocynum cannabinum or in a powder of the same drug Also he can identify powdered drugs and upon examination of a powder, he can state whether it is adulterated or not by the mere presence of a number of cells foreign to the plant part in question His microchemical tests would enable him in some cases to name the adulterant Since such products as talcum powders, artificial foods, infant foods, spices and condiments are commonly sold in the retail pharmacy, microscopical examination and microchemical tests for these products form an important part of the student's training

All of the laboratory work is supplemented with lectures, recitations, displays, lantern slides, motion pictures and demonstrations as well as field work By means of this orderly arrangement and obvious relationship of courses, we are convinced that the average student is encouraged to do better work, and is able to grasp the subject matter more easily and in a more coördinated form

SHALL THE RELATIONSHIP OF BOTANY TO PHARMACOGNOSY BE MAINTAINED?

BY C W BALLARD, PHAR D , PH D *

Editor's Note The old question as to whether basic subjects should be taught by men trained in pharmacy is presented by Dr Ballard in so far as it applies to botany His arguments

* New York College of Pharmacy, Columbia University

are excellent and no one will gainsay that it is not better to have these subjects taught by men trained in pharmacy *provided* they are specialists in their fields Such teachers can make the application to pharmacy much better than can a teacher who is not so trained However, we must recognize the fact that it is exceedingly difficult to secure well-trained specialists in general sub jects who are also well trained in the professional subjects that are based upon them Dr Bal lard's paper is worthy of careful reading by all interested in teaching pharmacognosy —C B JORDAN *Editor*

The procedure of the current Pharmaceutical Syllabus in its division of subjects into basic and professional groups is excellent However, owing to the close relationships between botany and phamacognosy, it is unfortunate that the content of the basic botany is not definitely stated The subject matter of pharmaceutical botany in previous editions was manifestly too restricted to give the student a general knowledge of plants but it was a clear-cut statement of what the pharmacy student should have covered in his course It diminished the difficulties of drawing a line of demarcation between botany and pharmacognosy as regards content

The policy of extreme generalization is just as objectionable as that of specialization in planning any professional curriculum This is especially true in pharmaceutical education because of the varied nature of the subjects included in the course It is entirely possible in a university maintaining schools or divisions of business, chemistry, medicine, botany and the usual academic or collegiate courses to cover all the subjects of the outlined pharmacy curriculum, with the exceptions of pharmacy and pharmacognosy Economic conditions are perhaps increasing the frequency of this procedure It is desirable that purely academic subjects as English, languages and mathematics be taught by those qualified in these branches and not by pharmacy school instructors However, in subjects of the science group it is desirable that the instructor consider both the general aspects of the subject and its relations to pharmacy In this manner we can better further the claims of pharmacy as a vocation requiring a thoroughly integrated course of professional education

The advisability of securing contact between botany as a basic subject and its specialization, pharmacognosy, has been frequently commented upon The general tenor of these comments is reiterated in a paper, "The Teaching of Pharmacognosy," by Prof Bacon (JOUR A PH A , Nov 1930), in which the following statements occur "The nature of the botany courses offered to pharmacy students should be carefully considered pharmacy students as well as students of other schools should be given in their first courses sound, working fundamentals to serve as a basis in specialized study " That this advisability of a proper coordination between basic and professional work applies equally well in other subjects, is evidenced by the following quotations from the current syllabus

Page 32 (*Applied Bacteriology*) ' When laboratory courses in Bacteriology are given to pharmacy students in medical, biologic or other departments, the attention of instructors should be called to the specific pharmaceutical applications listed below "

Page 51 (*Inorganic Pharmaceutical Chemistry*) ' Experience has proven that it is unwise to rely too much upon an understanding of subjects previously studied "

Page 128 (*Pharmacognosy*) ' Terms which students have supposedly learned in botany are not repeated but these terms should be used and applied "

I am not unmindful that the adoption of the blanket statement "standard college grade" for botany presents the following possible advantages—it checks tendencies to narrow the botanical teaching to those portions applicable to pharmacognosy, thus limiting its general educational features, it favors a mingling of the pharmacy men and the students of other schools, it relieves the pharmacy school of the labor and expense of a division of botany, it is a convenience in schools where the bulk of the general education is segregated as a pre-pharmacy year, it facilitates transfer of students to or from a pharmacy school to other schools of a university But against all these possible advantages is the question of what constitutes standard college grade, particularly in botany, and the interpretations which individuals and colleges may place upon this term A statement of hours does not remedy the situation There is probably a greater diversity of opinion as regards content of the courses in the botanical subjects than there is in pharmacy and chemistry Hence, there is a greater necessity for definite statements as to the content of the botany course Furthermore, the statement in the Syllabus of the reason for the omission of syllabi for the basic subjects is perhaps the strongest argument for their inclusion If the emphasis on integral parts of a given basic subject varies so appreciably in different colleges, it would appear advisable to establish some guide as to where, in the opinion of pharmaceutical educators, the emphasis should be placed Notwithstanding the general statement that basic subjects are not applied, I hardly think there will be a difference of opinion among us as to the applications of botany in the teaching of pharmacognosy

Failure on the part of the teachers in pharmacy colleges to at least attempt to influence the trends of teaching in the basic subjects may be construed as due to lack of necessity, lack of interest or, what is worse for pharmaceutical education, incompetency and I do not believe that these conditions prevail Formerly in many instances, the instruction in botany and pharmacognosy in the pharmacy school was given by men whose sole botanical training was received in the pharmacy course Frequently this specialization, together with lack of time, resulted in a restriction of the course in botany to its strictly pharmaceutical applications At present, in a goodly number of schools, pharmacognosy and botany are taught by men who have not only been pharmaceutically trained but in addition have studied botany in other institutions and in some instances have majored in this subject for an academic degree Their viewpoint is broadened and they are as capable of teaching general botanical science as the instructor in an academic college I believe that these men can outline a course in botany which will be acceptable to our universities as of standard college grade and which will serve as a better foundation for pharmacognosy than the usual academic course

The construction of a syllabus in botany to meet our requirements, both general and specialized, offers no serious difficulty Undoubtedly each of us would find that the introductory course in botany in our respective universities is considered a course of standard college grade With this as a working basis, the planning of a course to maintain the integrity of botany as a basic or cultural subject and at the same time place the proper emphasis on its relations to pharmacognosy, is entirely feasible The syllabus for botany submitted by Prof H R Totten in the preliminary draft of the present Syllabus, is an excellent example of the coordinating of botany with pharmacognosy without sacrificing the interests of either In our

university class, for the past eight years, we have been giving a course along similar lines The basis for our course is Botany 1–2 of Columbia College in an amplified and supplemented form to better meet our needs as a preparation for pharmacognosy Pharmacy men who subsequently enter other schools in the university receive 6 points of credit for the botany of the pharmacy school The time allotted is 240 hours, 96 didactic and 144 laboratory

Our foundation course in botany must also be considered as related to microscopic pharmacognosy and here the desirability of correlation is even greater than in macroscopic pharmacognosy Many of the academic courses in botany very properly present the topics of cellular structure and cell contents merely as incidental factors in plant organization and function This plan fits the needs of the college freshman rather than those of the pharmacy student as the former may or may not apply his knowledge of botany in subsequent work, whereas the pharmacy man must do so in pharmacognosy Where school organization compels a separation of botany and pharmacognosy, the content of the latter course must be increased and duplication is almost unavoidable The difficulties of maintaining correlation between separated courses are known to all teachers If the student receives part of the instruction on fibres, trichomes and starch grains in the botany course and another part in pharmacognosy, it is more than likely that duplication will be necessary The instructor in pharmacognosy must review the previous work or rest under the uncertainty as to how well it has been retained by members of a class His uncertainty is materially increased if the teaching in botany is without specification as to content

It is to be regretted that microscopic pharmacognosy has been classed as an optional subject The legal standards for drugs require familiarity with the microscopic as well as the macroscopic characters In the pharmacy curriculum the purpose of our instruction in pharmacognosy is to enable the pharmacist to intelligently read the official descriptions Giving microscopic pharmacognosy a secondary classification not only permits the elimination of a necessary professional subject but one which gives promise of ready recognition in academic botanical circles

We are all familiar with the tendency on the part of other educational institutions to minimize the work of the pharmacy college Of all the subjects in our curriculum, pharmacognosy is perhaps the one upon which we can rest our strongest claims for academic recognition It is a type of work which is not duplicated in any other part of a university Its scope and research angles are sufficiently broad as to warrant it being included with graduate courses in the division of botany in any university To further this recognition we must assume responsibility for the botanical courses which are the foundation for pharmacognosy We must not concede that an introductory course in botany without qualification as to content, constitutes an adequate preparation for pharmacognosy

COLLEGE OF PHARMACY,
COLUMBIA UNIVERSITY

Hungary—Pharmacies must always be open to the public An edict of 1919 fixes the opening hours from 8 00 A M to 7 00 P M For night service, Sundays, holidays, the authorities arrange a rota with the pharmacists for opening from 1 00 P M

RELATION OF CAFFEINE AND COFFEE TO HUMAN EFFICIENCY *

BY RALPH HOLT CHENEY

Efficiency and diet occupy a more prominent position in the public mind to day than in all previous history At the moment, caffeine beverages, especially coffee, are lauded or berated vigorously regarding their value in the diet in relation to human efficiency

Based upon "whims and guesses," coffee has been praised or condemned for centuries What is the scientific evidence "pro" and "con?" Historically, we find a prohibition edict by Khaine Beg, Governor of Mecca in 1511, who started a campaign which condemned coffee as an inebriating beverage forbidden by the Koran because the people frequented coffee houses rather than the mosques Coffee and coffee houses were taxed by European governments as a source of revenue Later, coffee houses were prohibited by Charles II of England as "Seminaries of Sedition" Coffee houses have served as gathering places for public discussions of governmental affairs They were the predecessors of the boulevard cafés of Paris and the coffee-house taverns of England This English prototype appeared in the United States where the coffee houses of Boston and New York harbored the instigators of the Boston Tea Party and revolutionary propaganda

In spite of six hundred years of agitation associated with coffee, its consumption has increased constantly from an insignificant amount to three billion pounds annually, and its use has spread from the Abyssinian hillsides to world wide consumption Mocha coffee from the original home of the plant now supplies less than 3% of the seeds (coffee beans) of this sweet-pulped, cherry-like fruit which was introduced in America in 1717 Its cultivation has changed the economic map of several countries Brazil has two billion coffee trees, Colombia a quarter billion, and the success or failure of the crop is the chief factor in the economic situation in these countries Eighty per cent of the total gold value of Salvadorean exports is coffee Although the plant is foreign to American soil, no better coffee is marketed to day than the Colombian or Brazilian Santos from the Uplands where it is prepared by the most modern methods

The United States consumes over one-half of all the coffee exported from the cultivated areas New York City requirements annually total seventy million pounds, for which we pay thirty million dollars Space limitation causes me to refer you to a book, "Coffee" (1), published by the New York University Press, for botanical characteristics, and also, for further details of the interesting, romantic history and economics of the plant and its beverage

Undoubtedly, more scientific experimentation on the subject of caffeine and coffee effects has been conducted during the last twenty-five years than in all previous time The results of such investigations are the only justifiable bases from which we may make our deductions regarding the physiological effects of the coffee as such, and of its individual ingredients

Many investigators have reported that caffeine and caffeine beverages are undesirable for young children neurotics, sufferers from severe arteriosclerosis, gastric hyperacidity, and other abnormal conditions Likewise, the administration of caffeine for therapeutic purposes, such as stimulation of the coronary circulation in cardiac deficiency, are well known May I make it perfectly clear, however, that the data presented in this paper is not concerned with the allergic effects of caffeine nor of the coffee beverage upon pathological conditions This paper does not deal with its therapeutic value All statements and figures refer entirely to *normal* physiology The experimental animals and human subjects employed in the investigations were selected purposely from individuals of as nearly average good health as could be determined readily In the caffeine work, the Merck product was used, and in the coffee work, the beverage was prepared by a rapid method (drip or vacuum) from recently torrified Colombian and Brazilian high-grade beans

Isotonic and isometric records of striated muscle fatigue curves of homologous muscles were made under non-treated and caffeine treated conditions The method and period of treatment were maintained uniformly throughout the series Detailed discussions may be found in the writer's earlier papers, especially on the animal gastrocnemius behavior (2, 3)

Although Herxheimer (4) found that caffeine was of no benefit to the athelete and P T Osborne states that caffeine actually interferes with the best muscular effects, the experimental data in this paper are more in agreement with H C Wood Jr, (5) and others whose results offer definite evidence of improved muscular function

* New York Branch, A PH A —See page 70, January JOURNAL

An extended series indicated that better physiological coordination of the motor mechanism was obtained in the striated muscle action of the frog under the influence of low concentration of caffeine According to the data presented in the August 1932, issue of the *Journal of Pharmacology and Experimental Therapeutics*, the optimum dosage (3) for these muscles for delaying fatigue was 0 1 mg per Gm body weight Similar studies using the coffee beverage as such, in lieu of the purified caffeine showed a parallel response for the gastrocnemius muscle

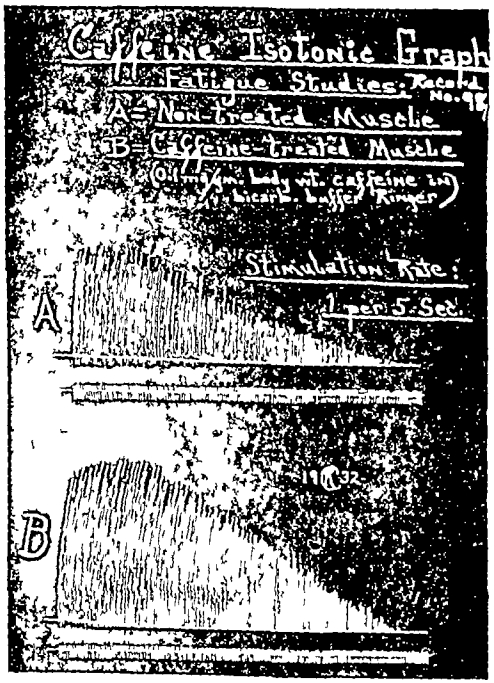

Fig 1 —Caffeine isotonic graph

A mathematical analysis of these fatigue curves in computing the XY values (Time *to* one half fatigue × Height *at* one half fatigue) demonstrated a greater XY value in both the caffeine and coffee curves as compared with the normal, non treated result

Under uniformly controlled circumstances a study of the physical fatigue in human male subjects was attempted The variable factor was the treatment, namely, the consumption of equal volumes of hot water, black coffee or hot water plus caffeine (equivalent to the amount in the coffee) prior to the fatigue test involving a weight-lifting exercise every ten seconds to complete fatigue Additional non treated, starch capsule plus hot water, or plain hot water days were completed in order to correct for any practice, accommodation or experience factor which may have developed during the experimental tests The Work Done was computed by the simple formula WD = Weight (Gm) × Height lifted (cm) × Number of lifts The result in gram-centimeters showed a sequence of an increasing amount of Work Done in the order of the non treated or hot water day (least), coffee day, caffeine day (most) Attention was given primarily to the following physiological factors

1 Blood pressure variations Systolic and diastolic

2 Respiration Rate and depth by pneumographic record

3 Time required for a complete recovery of all factors after fatigue

As compared with the non treated fatigue values, the blood pressure and pulse variations were negligible, that is, their variation under the treated conditions was similar to their variation under the non-treated conditions The increased respiratory rate and depth in the coffee instance indicated an increased oxygen consumption

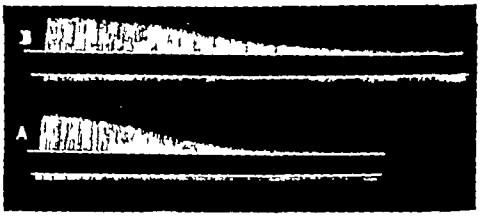

Fig 2 —Caffeine isometric graph

Fatigue Studies Record No 888
A = *Non treated* muscle, B = *Caffeine treated* muscle (0 1 mg /Gm body weight caffeine in bi carb buffer-Ringer) stimulation rate 1 per 5 sec

Several years ago (6), I conducted a series of tests to determine blood-pressure variations *without fatigue*, as influenced by caffeine and by coffee in comparison with normal behavior This work has been repeated recently as an additional series Similar and additional substantiating data were obtained The accompanying graph separates the primary and secondary coffee effects

and indicates the fact that other substances are involved besides caffeine in the total coffee effects Note that the caffeine or coffee increased the blood pressure only a few millimeters in excess of the ordinary luncheon (food) effect

Although caffeine has been reported as a vaso dilator of cerebral vessels, investigations (7) by Dr P G Denker of Bellevue Hospital caused him to conclude that caffeine definitely lowers the cerebrospinal pressure for half an hour This fact is suggested by some workers as a possible explanation of the recognized relief induced by coffee in instances of mild hypertensive or nervous headaches cerebral concussion fractured skull and brain tumor Sollman and Pilcher (8) reported in 1911 that caffeine causes vaso dilation of the cerebral vessels Wiechowski (9) had reported similar results in 1902 and claimed the dilation was due to a direct decrease in the tonus of the intracranial vessels Such action with a rigid cranium would force out the cerebrospinal fluid and increase its pressure Denker obtained the reverse results With reference to the decreased cerebrospinal pressure it is significant that caffeine diuresis through glomerular action, involves primarily only an increase in the water content of the urine This water loss must be lost necessarily from the body tissues through the lymph and blood It must accomplish

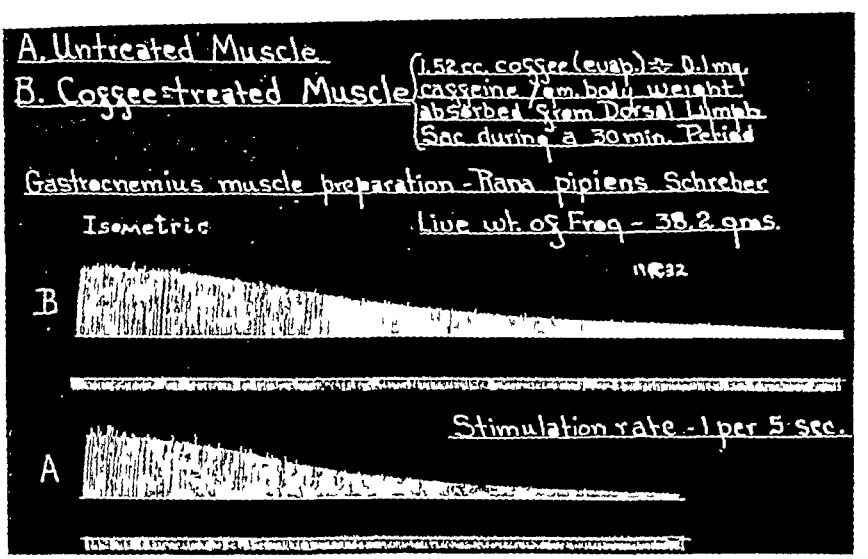

Fig 3 —Coffee effect on muscular fatigue

automatically a reduction in brain volume with a consequent decrease in cerebrospinal fluid pressure

The increased respiratory rate and depth, referred to earlier in connection with the fatigue as influenced by caffeine and coffee, is related also to an intercranial pressure In 1913, Dixon and Halliburton (10) noted that reduction of carbon dioxide in the blood decreases the rate of cerebrospinal fluid secretion Therefore, respiratory stimulation by caffeine or coffee, resulting in increased rate of carbon dioxide ventilation from the lungs, would decrease the rate of cerebrospinal fluid secretion Apparently, caffeine lowers intracranial pressure by means of its combined pharmacologic actions rather than by any specific, single effect

Dr A L Winsor (11) of Cornell University reported last October that coffee increases the salivary secretions in volume per unit of time Such stimulation automatically improves digestion by making a greater enzymic mass available

Professor Hollingworth's experimental series (12 13) on the mental effects of caffeine and coffee are the best available studies on this phase of the subject He reports a clearly distinguishable mental stimulation as evidenced by greater accuracy in the performance of work done

Recently at Long Island University, a simplified psychodometer was devised to measure the reaction time in man with a visual mental-physical coordination test Quantitative data on

the relationship of caffeine and coffee separately to the normal reaction time were compiled The subject was required to recognize a visual stimulus (light color), interpret it, and perform a muscular act in accordance with the color of the particular stimulus involved Caffeine and coffee were each more effective in reducing the total reaction time in women than in men The sequence in both sexes was as follows

1 Non treated tests required the longest reaction time
2 Coffee—intermediate
3 Caffeine-treated tests required the shortest reaction time

In various physiological effects studied regarding muscular action, fatigue delay, respiration pulse and mental effects, the sequence of minimum to maximum physiological stimulation is generally non treated, coffee treated caffeine treated The absence of injurious effects in the majority of cases suggests the importance of optimum consumption Excessive stimulation can be produced but was not apparent in the amounts administered in the experiments upon normal animals and man, although the quantities given were in excess of average consumption The absence of after effects and accumulative effects is associated doubtlessly with the two primary facts

1 Caffeine is combined with other chemical substances in coffee
2 Caffeine itself loses CH_3 groups in the body and is excreted within a few hours in the urine as mono- and dimethyl xanthine

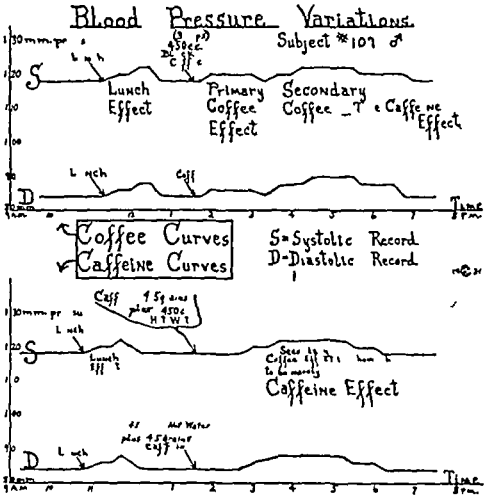

Fig 4 —Blood-pressure variations caffeine *vs* coffee effects

Likewise, Gutman (14), in agreement with this conception, observed that caffeine and coffee effects are not the same in abnormal persons (patients) showing allergic manifestations to coffee Whereas caffeine may cause definite physiological disturbances, coffee may be well tolerated Moreover, the action of coffee is not due solely to caffeine, but to the many compounds organized during the roasting process, and which are present in both decaffeinated and ordinary coffees

Caffeine and coffee increase blood pressure very few millimeters, respiration and oxygen consumption slightly, and stimulates the brain and other parts of the central nervous system These stimulants also delay fatigue and lower the cerebrospinal pressure Caffeine is less effective in the coffee beverage than separately Neither complex, caffeine nor the coffee beverage as such, can replace nutritive metabolism in the normal health of the tissues It has been reported that both complexes increase basal metabolism, hence, food should always be taken regularly at the customary periods if the reserve forces of the body, which are reduced by increased metabolism, are to be replenished properly Nevertheless, many people labor under the misconception that coffee has the ability to replace food merely because its stimulating action persists for several hours after consumption It is an aid to functional efficiency, not a substitute for body fuel

The variations from the normal due to coffee stimulation are slight and, in the reasonable amounts consumed ordinarily, are far below the maximum physiological disturbances, for the correction of which the body is equipped by nature to adjust itself without injurious effects

Apparently, the delicate correlation between the increased blood flow and the increased respiratory rate accomplishes, in a fortunate sequence, *both* the more rapid removal of fatigue products from the body tissues to the blood, and, the greater purification (oxidation) of the blood

volume per unit time in the lungs Fatigue, due to the accumulation of waste products in the tissues, is correspondingly delayed Caffeine separately or in the coffee beverage, stimulates the circulation and respiration The increased activity of one of these systems without a parallel response by the other, would be injurious The stimulation of both synchronously, produces or "sets" the body metabolism at a higher level of physiological efficiency That the body readily adjusts itself to the level of performance without injury is evidenced by the fact that the recovery time of the fatigue is practically identical with conditions subsequent to normal fatigue

The bulk of available experimental data seems to indicate that the majority of the population may take advantage of this beneficial aid to body metabolism Every debatable question has its ' pro" and "con " Each of us has a caffeine and coffee tolerance which must be determined individually, and our consumption governed accordingly

HOSPITAL SALES EXEMPTED FROM CODE RESTRICTIONS

Hugh S Johnson Administrator for Industrial Recovery, has issued the following order effective from February 2nd

"Pursuant to authority delegated to me by executive orders of the President, including Executive Order No 6543-A, dated December 30, 1933, it is hereby ordered that those members of industries subject to codes of fair competition who sell or may sell supplies or materials to hospitals of the United States which are supported by public subscription or endowment, and not operated for profit, within the limitations hereinafter provided, be and they are hereby exempted from compliance with provisions of such codes governing sales, provided, however, that the exemption hereby granted shall be limited to and operative only in connection with such sales made by such members to such institutions, that nothing in this order contained shall relieve any such member at any time from the duty of complying with all other provisions of such codes, and that this order shall not become effective for a period of ten days in order that consideration may be given to the objections, if any, of interested parties thereto At the expiration of such period this order shall become effective unless I, by my further order, otherwise determine "

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council" —Part of Chapter VI, Article VI of the By Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association"

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association holding not less than six meetings annually with an attendance of not less than 9 members at each meeting and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates"

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

CHICAGO

The monthly meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held January 16, 1934, at the University of Illinois College of Medicine

President Terry opened the meeting and called for the report of the nominating committee for officers of the Branch for the ensuing year Dean Day chairman of the committee, presented the following nominations

President G L Webster
First Vice-President, S W Morrison
Second Vice-President R A G Linke
Third Vice-President, H M Emig
Secretary Treasurer, L Templeton
Delegate to the House of Delegates, R E Terry
Committee Chairmen

Membership, Thomas P Rylands, Legislation, J Riemenschneider, Practice I A Becker, Medical Relations Dr Bernard Fantus, Publicity A E Ormes

By a unanimous vote the nominees were declared elected

Secretary Treasurer L Templeton was called upon to give a financial report of the past year The report showed a balance of $1 15 in the treasury

Dr Muehlberger, chemist for the County Coroner, was introduced as the speaker of the evening His subject was "The Toxicology of Common Drugs" He stated that due to the nature of his position he was experienced primarily with fatal poisonings A summary was made of the types of fatal poisonings that he was called upon to investigate, such as accidental, suicidal or with criminal intent Mention was made that fashions were found in suicides due to the publicity that follows in the newspapers

Common poisons and their detection by (1) odor, (2) chemical analysis, (3) biological analysis, (4) quantitative analysis were discussed at some length There must be proof beyond doubt for criminal court procedure

Dr Muehlberger pointed out that quantitative results were very hard to obtain in the case of mercury or arsenic poisoning due to the fact that the organic preparations of these two elements will show large amounts of the element in the body, which means nothing so far as a fatal dose is concerned

Lye as found in sink and drain cleaners, was mentioned as being one of the worst poisons to combat, as scar tissue is produced that fails to heal quickly The lye seems to eat deeper into the tissues as time goes on The acids do not produce an insidious scar tissue

Dr Muehlberger stated that he had not used Methylene Blue as an antidote for cyanide or carbon monoxide poisoning, but had read much of the literature that was being published lately regarding its use He had found amyl nitrite, sodium nitrite and sodium thiosulphate to be beneficial in the treatment of these poisonings

The discussion was followed with an open question and answer period which was thoroughly enjoyed by the large group assembled

The meeting was closed by the newly elected president, G L Webster

L TEMPLETON *Secretary*

NEW YORK

The January meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on January 8 1934, in the College of Pharmacy, Columbia University President Bilhuber was in the chair and about fifty-five members and guests attended

The report of the secretary was read and accepted Following this Mr Currens, treasurer, reported

Chairman Lehman, of the Committee on Legislation and Education, reported that the State Board of Pharmacy was gathering samples in cosmetic shops to see if their drug products met Pharmacopœial requirements

Chairman Kidder, of the Professional Relations Committee, reported that the Physicians' and Pharmacists' Dinner Committee was still functioning Dr Wimmer reported a physicians' and pharmacists' meeting to be held by the Academy of Pharmacy in February Dr Ballard called attention to the meeting of the Bronx County Medical Society on January 17th, for which a display of U S P and N F preparations was being arranged

The chairman of the Membership Committee, Dr Kassner, reported applications for Branch membership from Frank Pokorny, John Torigian and Richard G Keller All were voted to membership in the Branch

Chairman Lehman of the Nominating Committee, reported the following nominations for Branch officers during 1934

President, Charles W Ballard
Vice President Frederick C A Schaefer
Treasurer, Turner F Currens
Secretary, Rudolf O Hauck
Chairmen of Committees
Audit, Ernst A Bilhuber
Professional Relations, Herbert C Kassner
Legislation & Education, Robert S Lehman
Progress of Pharmacy Morris Dauer
Membership, George J Simpson
Secretary Remington Medal Committee and Delegate to House of Delegates, Hugo H Schaefer

Mr Lehman also reported that the Nominating Committee recommended that the chairmen of the respective committees should appoint members who could report at the meetings should the chairman find it impossible to attend

On a motion made by Dr Schaefer and duly seconded by Dr Kidder the secretary was requested to cast one ballot electing the new officers unanimously Dr Schaefer included in his motion the recommendation of the Nominating Committee pertaining to appointed members for the several committees

Following the election of officers Dr Bilhuber thanked the members of the Branch for their coöperation and turned the meeting over to President Ballard The new president expressed his appreciation to the Branch for the honor bestowed upon him and proceeded to briefly outline plans for future meetings

After some brief introductory remarks, Dr Ballard presented the first speaker of the evening Mr James F Hoge who spoke on the Tugwell Bill, the Black Bill and the Copeland Bill Mr Hoge's discussion was from the viewpoint of the lawyer Brief abstracts of his comprehensive address follow It will be understood that it is difficult to do justice to the speakers, whose well prepared addresses are based on careful studies of the legislation

FOOD AND DRUG LEGISLATION

ABSTRACT OF AN ADDRESS BY JAMES F HOGE OF THE NEW YORK BAR

Mr Hoge introduced his remarks by stating that the food and drugs legislation involved the question as to whether the legislation shall be by Congress an enforcement by the courts as now, or legislation and enforcement by a government officer in the Department of Agriculture

The speaker outlined some of the activities of the present drug law which was enacted in 1906 He stated that dissatisfaction with the present law is usually asserted in four principle respects *First* to establish a violation of the law the Government must prove that statements regarding curative effects of drugs are not only false but are also fraudulent He said that there is reasonable argument for the suggestion that the Government should be relieved of the burden, and added that where an honest mistake is made through error or inadvertence it seems harsh to inflict criminal punishment, but the public health is involved *Second*, criticism of the existing law is, that it does not apply to advertising *Third*, the present law does not apply to cosmetics *Fourth*, the general complaint is that the law needs improvement in definitions and administrative detail

He referred to the fact that the Tugwell bill as first formulated would vest in the

Secretary of Agriculture broad and almost unsupervised legislative, executive and judicial powers Mr Hoge spoke at length regarding the latter provision in discussing the Copeland bill

The speaker gave a history of the various bills which have been introduced and analyzed, the Copeland draft, which he said evidenced that criticisms made of the Tugwell bill were valid In his opinion, the Copeland bill shows the sincerity, fairness and intelligence of the Senator This proposed legislation is a revision of the Tugwell bill which it follows section by section and in some sections its language is retained the speaker gave a careful analysis of the draft and an explanation of the changes which have been made

He stated that the general administrative provisions of the Tugwell bill have been deleted and in their place a new section has been inserted which authorizes the secretary to promulgate regulations with the aid and advice of a committee on Foods and a committee on Drugs each to consist of five members appointed by the President of the United States The bill provides for court review of regulations vesting the courts with jurisdiction to restrain by injunction enforcement of any regulation shown to be unreasonable and not in accordance with law or that will cause the petitioner substantial damage by reason of this enforcement

After further discussing the Copeland legislation the speaker analyzed the bill in the House of Representatives by Congressman Black which carries in its provisions the amendments suggested by James H Beal He said that to accomplish the objectives it is largely a matter of choice whether the new bill is enacted or the present law amended For amending the law the bill by Congressman Black will accomplish the purpose and Senator Copeland's measure will do so in an entirely new law Neither of these bills are subject to the criticisms and valid objections which were made to the Tugwell bill

The speaker discussed the power of seizure vested in the Secretary of Agriculture The former bill modifies this power and the Copeland bill retains substantially the Tugwell provisions He discussed at some length the advertising provisions and wording of labels He said that speakers for the Tugwell bill referred frequently to the regulations being subject to review by the courts and violations of the prohibitions of the bill can be established by trial He said this was neither theoretically nor practically true under the bill as drawn He spoke at length regarding multiple seizures and the effects and referred to the fact that the Government has seized, for instance in New York, Pittsburgh, Philadelphia, Baltimore, Oakland, Calif, Portland, Me, Miami and elsewhere, simultaneously with the threat implied in the situation that if an adjustment of the controversy satisfactory to the Department is not promptly made more seizures will follow The speaker gave a very complete explanation of the effect of such seizures He said that as a legal matter and as proper law-making the seizures should be limited to adulterated poisons, putrid or filthy goods and misbranding should be punished by indictment and prosecution with a hearing at which the differences may be reconciled He said, "it is conceivable that misbranding of a flagrant nature representing an article to be a cancer cure might be imminently dangerous to public health and the public should be protected" To protect the public against that and also to afford the defendant an opportunity to be heard a proceeding in equity by the Government for injunction would be appropriate Provision for this is made in the Black bill and a simple amendment to the Copeland draft would make a similar provision

The speaker concluded his remarks by saying that we should have legislation which will not violate American principles of law-making and law enforcement, a law that is fair to the public and to the people who try to do business with the public The legislation should, as far as possible, stamp out fakes and frauds and he thought that such legislation could be had without discarding our legislative and judicial institutions, and both the Black and the Copeland bills are evidences of it

The laws which contain blanks to be filled in by a bureau chief are open to definite possibilities of abuse He stated that the advocates of the Tugwell bill had the protection of the public at heart, and referred to possibilities with the change of officials, their viewpoints may be radically different Mr Hoge concluded by saying "In the final analysis more than a food and drugs law is involved in this question The objection is not primarily an objection to any particular legislation, but to an attitude of mind and the theories of immature idealogists upon which this legislation seems to be based This attitude of

mind disdains the legislative and judicial machinery I concede readily the existence of abuses, defects and miscarriages in our legislative and judicial institutions As a lawyer I deplore them But, I call all to witness that these institutions afford security and safeguards which are inherently necessary if this country is to remain free "

The second speaker for the evening was Mr S L Mayham who spoke about the new food and drug legislation from the standpoint of the cosmetic industry A brief abstract of his address follows

Food and Drug Legislation from the Standpoint of the Cosmetic Industry

ABSTRACT OF AN ADDRESS BY S L MAYHAM

The speaker stated that the Tugwell bill had ceased to be of interest, having been replaced by the Copeland bill, S 2000, and another bill by Congressman Black has been introduced He said that the latter was formulated along the lines of the argument presented by Dr James H Beal at a hearing some time ago He stated that Senator Copeland had failed to make certain changes in which the cosmetic industry is deeply interested The first is a definition of the term "drug " The cosmetic industry is ready to accept regulation but does not want to have its products classified as drugs except where curative claims are made Under the Copeland bill many of the cosmetic products are included The industry also objects to certain definitions applied to an advertisement, being too broad The advertising regulations include all representations of facts or opinion disseminated in any manner by any means This would include house to house canvassers

The speaker said the Copeland bill provides that the name and the place of business of the manufacturer, seller or distributor must appear on every package, but if all this information is necessary there are some packages on which the type of labels would have to be very small He stated that if the definition for antiseptics is required, practically every preparation of that class would have to be provided with a new label The cosmetic industry objects to the licensing provision in the Food and Drugs Act Under publicity, the Copeland bill provides that information shall be disseminated regarding the dangers of certain cosmetics There is a provision in this draft that no person who is a member of the Department of Agriculture or who has a financial interest in the manufacturers' advertising the sale of any food, drug or cosmetics shall be eligible to appointment on the committee provided by the law The speaker contended that under its provisions scientists in the cosmetic and pharmaceutical fields could not serve on the committee, nor any of the technical advertisers serving in that capacity at the present time

The cosmetic industry objects to the definition which includes all substances and preparations other than foods and all diseases to affect a structure or any function of the body of man or animals, also to the provision of the bill which considers cosmetics adulterated if they contain poisonous or deleterious ingredients, likely to be *imminently* dangerous to the user under the condition or use prescribed in the labeling It is the opinion of the cosmetic industry that the word ' imminently" could lead to a great amount of litigation

The speaker stated that the industry had no fear of any trouble arising from restricting dangerous poisons or deleterious ingredients and are interested in seeing such legislation enacted He considered that some changes in the Beal draft should be made The cosmetic industry would prefer to be entirely divorced from the Food and Drugs Act He favored a measure that is fair and satisfactorily protects alike the interests of the consumer and those of the manufacturer

Dr Wharton, of the local Department of Agriculture office, complimented both speakers on their fair and adequate discussion of the proposed legislation, and he expressed regret that Department policy made it impossible for him to take part in the discussion

Dr Fischelis called attention to the fact that the speakers actually brought forward some points in favor of the Tugwell bill He also went on to explain that the power to regulate advertising should be vested in some competent authority Advertising goes before a public not educated in law nor technical points, and many of these statements have a different lay interpretation which is not infrequently misleading Dr Fischelis also pointed out that greater flexibility was required in the law due to rapid changes which take place He especially pointed out the need for controlling radio advertising which reaches so many people at once and so quickly And finally he criticized the industry for not

admitting the inadequacy of the present law when the new was proposed

Since there was no further discussion the meeting adjourned following a rising vote of thanks accorded all speakers

RUDOLF O HAUCK *Secretary*

NORTHERN NEW JERSEY

The Northern New Jersey Branch, of the AMERICAN PHARMACEUTICAL ASSOCIATION, met for its first meeting of the new year on January 15th, in the main building of the Rutgers University College of Pharmacy

After the reading of the minutes, President Little introduced two of our newest members, Albert Hawes and Milton Kahn, who were participating in their first meeting

The Membership Committee then proposed the following individuals for inclusion on our roll Ralph Nacca, James A Bauman, William J Ohland Milton Jungling and George Mitterman They were duly elected

Plans are rapidly being consummated for the joint meetings between the physicians, dentists and the Branch It is hoped that many pharmacists who are not members will attend these sessions and bring their medical and dental friends Mr Mecca, who is in charge of the programs assures us that every minute will be taken up with topics and demonstrations of real interest

Norman Silsby, the first speaker on the new series of 10 minute talks concerning some phase of the profession, read some of the absurd advertising claims made by a manufacturer relative to a product being detailed to physicians He thus illustrated how the doctor is oftentimes made to accept and prescribe inferior medicines solely on the strength of falsely advertised virtues 'The pharmacist should work in closer cooperation with the physician," said Mr Silsby "and forestall these false prophets of therapeutics"

He also compared the cost of detailing to a pharmaceutical house with personal visitations by pharmacists and the relative success of each It would appear, he felt, that the pharmacist has a decided advantage in every way

This entertaining and instructive talk was closed with a reference to the high desirability of a good library of journals and reference texts in the prescription room of every pharmacy

Prof C L Cox, in his report for the committee on the Science and Practice of Pharmacy, touched upon the completion and occupation of the headquarters building in Washington, the work of the new Prescription Protective Bureau, recent explanations of the alcohol regulations, proposed survey of open prescription departments, and the revised Tugwell Bill R W Rodman added a few comments about the various substitute bills which have just been introduced into the two houses of Congress, pointing out as he did so, *the futility of intelligent abstracting of the bills for purposes of brief discussions* such as we were permitted in committee reports This was forcibly driven home by the fact that proponents and opponents in congressional committee sessions, spoke for 4 to 5 hours at a time on the bills

The speaker of the evening James A Bauman, of the State Board of Pharmacy, was then introduced by President Little He discussed the recent State legislation pertaining to the sale of hypnotic drugs, the new prescription laws, and the Board of Pharmacy regulations resulting therefrom

He brought out the fact that some of the Board regulations relative to the prescription law were forerunners of legislation planned to strengthen the professional standing of the pharmacists of New Jersey

The formal discussion finished, Mr Bauman answered many questions of procedure which had been bothering pharmacists since the enactment of the new laws C Graham McCloskey, also a member of the State Board, was present and gladly coöperated with Mr Bauman in handling the flood of questions

We greatly appreciated the presence of these two men and hope that they will bring their colleagues and meet with us often

The meeting adjourned after Mr Rodman had announced that Dr James C Munch of Sharp and Dohme would be the speaker at our next gathering

L W RISING, *Secretary*

NORTHERN OHIO

The regular monthly meeting of the Northern Ohio Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on February 9, 1934 Featured as a dinner meeting in the dining room of the Western Reserve University Faculty Club, it proved to be a very profitable affair for the score or so of prescription pharmacists who were present, besides the faculty members of Western Reserve School of Pharmacy

The first half of the business meeting was taken up by a review of the literature dealing with iron medication Prescription suggestions were approved for use in the makeup type prescriptions to be distributed among the 1400 physicians of the Cleveland Academy of Medicine

The second half of the meeting was given over to reports by members on their recent efforts in detailing physicians The various viewpoints and criticisms of both physicians and pharmacists were made to serve a very useful purpose in the formulation of additional methods of approach

All the members present were highly gratified with the results so far attained Evidence that the initiative shown by the members in detailing physicians will bring results is indicated by the active coöperation of the Cleveland Academy of Medicine and the recent applications for membership to the Northern Ohio Branch of the A Ph A

NEIL T CHAMBERLIN, *Secretary*

NORTHWESTERN BRANCH A PH A

In connection with the Golden Anniversary Meeting of Minnesota Pharmaceutical Association there was held a joint session of the Scientific and Practical Section and the Northwestern Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION

A condensed program of the session follows

Address of chairman, Dean Frederick J Wulling Reports of the following committees College of Pharmacy J L Fitzgerald chairman, Drug Plant Culture G J DeMars, chairman, Practical Pharmacy, J B Slocumb chairman, Professional Standards by A R F Johnson Interprofessional Relationships H H Gregg, Jr , chairman, Research Dr Charles H Rogers, chairman, Hospital Pharmacists Sister St George, chairman U S P and N F Revision, F A Upsher Smith, chairman Adulterations, Rugnar Almin chairman, Public Health, H O Tiegen chairman Fellowship, C T Heller chairman, Rho Chi George Crossen, Historical, Dean F J Wulling, chairman Report of Minnesota Pharmaceutical Educational Conference, F J Wulling College of Pharmacy, University of Minnesota Annual Historical Report F J Wulling Paper on Professional Pharmacy, Theodore A Arneson Iodine Standards Oscar F Muesing Fifty Years of Personal Observation in the Advance of Pharmacy, George Countryman Report on N F Revision Work Gustav Bachman The Pharmacist and the NRA, N Vere Sanders A Paper, George T Kermott The Art of Compounding, David F Jones The Significance of Business History, Willoughby Babcock Another Patent Medicine Era, Joseph Vadheim Report on M S Ph A Fellowship, Karl Goldner A New Deal for American Pharmacy, Anton Hogstad, Jr Biennial Report, College of Pharmacy, University of Minnesota, F J Wulling Historical Pharmacy in Minnesota, F J Wulling Presentation of M S Ph A Scholarship Token, President Anderson The Pharmacognosy of Animal Drugs—A New Field of Pharmacognostical Study, E B Fischer A Paper, Edward Brecht The Influence of Standardizing Agencies in Education, F J Wulling The M S Ph A High Spots—Semi Centennial, F J Wulling Pharmacognostical Investigations of Chrysanthemum Balsamita var Tanacetoides and Chrysanthemum Balsamita (Balsamita vulgaris), E B Fischer A Brief Paper John Connell

A conference of the National Association of Boards of Pharmacy and the American Association of Colleges of Pharmacy was held on the same day February 15th

PHILADELPHIA

The January meeting of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Temple University School of Pharmacy, on Tuesday evening, January 9th

President Eby called the meeting to order and announced the program as a Symposium on the new Hormone—Tissue Extract

Dr James C Munch, Associate Professor of Pharmacology at the School of Pharmacy Temple University, was introduced, and began a discussion of the preparation and pharmacology of Tissue Extract The following information was brought out in Dr Munch's talk

Tissue Extract is found in the pancreas, liver and kidneys, and is excreted in the urine Before the discovery of this hormone, insulin was sometimes used in the treatment of hypertension but it was found that in extraction of the pancreas an impure insulin was obtained containing some Tissue Extract, and that this, and not the insulin was responsible for the fall in blood pressure

The active principle of Tissue Extract is a vasodilator, and a direct antagonist to epinephrine Its unit value is determined by its

epinephrine-neutralizing effect When epinephrine is injected it produces a constriction of the arteries and a rise in blood-pressure Tissue Extract counteracts this effect One cc of Tissue Extract is standardized to counteract the effect of 0 01 mg of epinephrine

Dr Munch's assistants prepared an anæsthetized dog, its blood-pressure being recorded on a kymograph Epinephrine was injected and the rise in blood-pressure noted Then injections of Tissue Extract were made and the counter effect was apparent on the recording device

President Eby then introduced Dr Joseph B Wolffe Associate Professor of Medicine at the Temple University School of Medicine Dr Wolffe's discussion concerned the clinical phases of the Tissue Extract He spoke of the considerable interest at the present time in various forms of heart disease, especially angina pectoris, or the construction of the coronary artery High blood-pressure comes on gradually, and the arteries are often hardened and blocked before serious symptoms are apparent Angina pectoris is caused by indiscretions in dietary habits, excessive use of tobacco, etc Dr Wolffe has successfully treated causes of angina pectoris with Tissue Extract, and finds that in 55% of the cases clinical relief was obtained, 30% were partially relieved and 15% were failures The hormone is injected intramuscularly or subcutaneously in doses of 2 to 5 cc , each cc representing 10 units

Special diets are used in conjunction with the Tissue Extract, depending upon the type of patient Dr Wolffe's talk was illustrated with a series of lantern slides

The following resolution was presented and adopted

RESOLUTION ON THE DEATH OF JOSEPH W ENGLAND

WHEREAS it has pleased Almighty God to remove by death our Beloved Co-worker and Fellow member, Joseph W England, who died December second, and WHEREAS Mr England served the profession of Pharmacy in many positions of responsibility in both state and national associations, over a period of fifty years, and in his death Pharmacy has lost one who had contributed in many ways to the furtherance of its highest ideals He was a man esteemed professionally by all who knew him He graduated from the Philadelphia College of Pharmacy and Science in 1883 In 1886, he was appointed Chief Pharmacist in the *Philadelphia General Hospital* and in 1900, he became head of the Pharmaceutical Department of the H K Mulford Company He left that position in 1902 to become Scientific Director of Smith, Kline and French Laboratories, Philadelphia He was widely known for his researches in Pharmacy, and was the author of hundreds of original articles of scientific character and many of an historical nature At one time he was a member of the Revision Committee of both the U S P and the N F He served as curator of the Museum of the Philadelphia College of Pharmacy and Science from 1887 to 1920 and had been a trustee of the institution since 1892, and the chairman of the Board since 1924 In 1903 his *Alma Mater* conferred upon him the degree of Master in Pharmacy, *honoris causa* From 1893 until his death, he had served as a member of the Publication Committee of the Philadelphia College of Pharmacy and Science and since 1904 had been recording secretary of its Alumni Association He served as its president in 1891–1892 Other services included the Acting Editorship of the AMERICAN PHARMACEUTICAL ASSOCIATION *Bulletin* in 1910 and 1911, and the chairmanship of the same Association's Committee on Publications He also had been secretary of the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION He was the Editor of "The First Century of the Philadelphia College of Pharmacy," a volume widely acclaimed for its accurate and fascinating portrayal of the first one hundred years of this college In 1926, he was president of the Pennsylvania Pharmaceutical Association and in 1921–1922 held the presidency of the Philadelphia Branch A PH A

Resolved, that we express our deep sorrow at his death and extend to his widow and daughter our sincere sympathy in their hour of bereavement

Resolved, that a copy of this resolution be sent to the family, be spread upon our minutes and be sent to the Editor of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

E H MACLAUGHLIN, *Secretary*

PITTSBURGH

The Pittsburgh Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION held a well attended meeting Tuesday evening, January 16, 1934 in the main lecture room of the Falk

Clinic The group had the pleasure of hearing John Russell, X-ray technician of the Falk Clinic, Dr W Harry Archer, lecturer in Anesthesia and Exodontia of the School of Dentistry, University of Pittsburgh, and Dr Paul Walker, associate professor of Exodontia and Anesthesia, School of Dentistry, University of Pittsburgh

Clarence T Van Meter presided

John Russell, X ray technician of the Falk Clinic, presented a very interesting and practical demonstration of X ray and Fluoroscopic Technique He showed an instructive film on the manufacture of X ray plates In summarizing his presentation Mr Russell indicated to the group how very important to health is the necessary cooperation between patient and physician when an X ray or fluoroscopic examination is needed The pharmacist can serve in breaking down the idea that there is something mystic or fantastic about X ray and fluoroscopic diagnosis The patient must be brought to the realization that it is a very necessary part of complete medical service when it is ordered by the practitioner

President Van Meter introduced Dr W Harry Archer member of the teaching staff of the School of Dentistry, University of Pittsburgh Dr Archer presented a paper entitled 'A Discussion of Dentifrices and Mouth Antiseptics ' The speaker elected to present the good and bad qualities of certain proprietary articles sold as dentifrices and mouth antiseptics He stated that many dentifrices on the market to day are unnecessarily and irrationally complex in composition The sole function of a dentifrice is to aid in keeping the teeth clean by the removal of food debris by the mechanical use of the tooth brush He cited instances where 'the claim for therapeutic or bacteriostatic virtue of some of the dentifrices on the market to day borders on the ridiculous " He then indicated the formulated provisions of the council of therapeutics of the American Dental Association for the inclusion of dentifrices in Accepted Dental Remedies " Mention was made that, The labors of the council of therapeutics are at present directed toward a control of irresponsible claims made in dentifrice advertising together with the exposure of misbranded and injurious dental nostrums " Dr Archer said

I was pleased to note that the code of ethics of the AMERICAN PHARMACEUTICAL ASSOCIATION deals with the subject of nostrums as follows The pharmacist should uphold the approved legal standards of the United States Pharmacopœia and National Formulary and should as far as possible encourage the use of these drugs and preparations and discourage the use of objectionable nostrums He should not accept agencies for objectionable nostrums nor allow his name to be used in connection with advertisements or correspondence furthering their sale ' A number of agents used to whiten teeth are sold directly to the public at drug stores and department stores In order to make this discussion interesting to you, I made a survey of twenty-five drug stores throughout Metropolitan Pittsburgh, to ascertain what dentifrices were stocked The results were tabulated and I found that, in spite of all publicity given the harmful products six out of every twenty-five, or approximately 25%, stocked one or two of the worst dental nostrums on the market to day I was gratified to learn that the majority when asked what they had for pyorrhea, advised the individual to have the condition treated by a dentist '

The speaker considered the fact that one drug store stocked 28 different kinds of tooth pastes and powders and 13 mouth washes Now it isn't my purpose to tell you how to conduct your business " said Dr Archer but it seemed to me that this pharmacist had a lot of money tied up in seldom called for articles Now where can he start to eliminate and what can he tell his customers when they ask for certain preparations? Obviously he could not use the classical excuse, We do not have that but we do have something better ' I suggest for instance that he could tell a customer who called for a nostrum that he did not stock this product as it has been proved to be injurious to the tooth enamel by authorities and that this code of ethics prohibited him from stocking injurious products " Two benefits would be derived from such a procedure whereby the most glaring nostrums are eliminated from his stock

First His stock of non-essential preparations would be greatly reduced allowing him a larger stock of essential preparations

Second He would be putting into effect the principles of his code of ethics ' At this point the speaker presented the results and findings of investigators of the American Dental Association and cited instances of over medication with such medicaments as Sodium perborate and alkalies

It is disgusting to read in a magazine, or

hear on the radio the wild, exorbitant claims made for some dentifrice, knowing that they are not the result of conscientious, careful research, but the abortive product of some high pressure advertising manager, whose knowledge of dentistry is obtained from a text book on dental diseases

'The leading Dental Schools to day give their students a course in Dental Medicine and Pharmacology At the School of Dentistry, University of Pittsburgh this course covers fully all remedial agents that properly belong to the field of Dental Medicine, includes prescription writing and discusses briefly the most important general remedies available in dental diseases and emergencies The course causes the student to familiarize himself with the dental preparations of the National Formulary During the Junior and Senior years when the clinical work is done in the infirmary these students write prescriptions for their patients which are countersigned by the instructor, and the patient has the prescriptions filled at the school's pharmacy When the students graduate they are equipped with sufficient knowledge to enable them to cooperate intelligently with members of the pharmaceutical profession

The next speaker, Dr W Paul Walker, associate professor of Exodontia University of Pittsburgh School of Dentistry, considered the use of Analgesics Anodynes and Sedatives in Dentistry

Quoting from Dr Walker s paper

'One of the large commercial houses manufacturing a brand of procaine hydrochloride used in local dental anesthesia, quotes from Hippocrates for its advertising slogan 'The Alleviation of Pain is a Sublime Task' We are willing and ready to recognize not only the professional idealism but also the economic value of such an intensely worth while goal as is the prevention of human suffering Since time, indefinitely ancient man has made efforts to alleviate or eliminate pain From the crude aboriginal method of chewing cacao leaves, and allowing the saliva to drip into the open wound, down to the present day multiplicities of anesthetics, sedatives, anodynes analgesiques, hypnotics, etc we follow an ever broadening field of human endeavor and activity It has been because of the scientifically correct use of such medicaments at hand and the constant striving to eliminate the useless and deterrent methods that the science of materia medica therapeutics and pharmacology has advanced so greatly along this line

'Along with the true accomplishments in the discovery and perfection of really valuable drugs and remedies have come also a host of others developed for selfish commercial purposes So many, indeed, have been the preparations perfected that even the most experienced professional man occasionally is lead astray by these modern medicinal gold bricks It is with the thought of upholding a higher ethical standard, in that the worthless be eliminated in favor of the truly valuable, that I enter upon this subject"

Dr Walker then formulated the following classification

1 *Analgesics* — produces insensibility to pain

2 *Anodyne*—relieves or assuages pain

3 *Sedative*—moderates or tranquilizes excitement

In further consideration of his subject Dr Walker indicated how important it is for the prescriber to be thoroughly familiar with the pharmacology posology and toxicology of the drug

The therapeutic classification Dr Walker presented was very complete The official medicinal and remedial agents possessive of the aforementioned therapeutic properties were particularly emphasized Those preparations which are acceptable to the American Dental Association and to the Council of Chemistry and Pharmacy of the American Medical Association were stressed Those to which some objection was raised, were also discussed

In summation Dr Walker is quoted, 'Simplified and rational therapeutics remains a fundamental law in medicine and in dentistry These few drugs namely barbital, phenobarbital, phenacetine, amidopyrine, antipyrine and acetylsalicylic acid etc, have not lost their therapeutic value by the formulation and preparation of so called substitutes It is, of course, necessary that open mindedness be used in considering new remedies of value, but it is of paramount importance that the old and valuable shall not be discarded for some new and questionable It is to be hoped and desired that a conscientious effort on the part of the professional man be evidenced in bringing about this valuable reform, in drug usage and manipulation which is so intensely necessary at this time"

The papers were briefly discussed by Dean C Leonard O'Connell, and an invitation extended to the guest speakers for a joint session of the Pittsburgh Branches of the Dental and Phar-

maceutical Societies It is hoped that this can be arranged soon

On motion, a rising vote of thanks was accorded those who participated in the evening's program

President Van Meter presented to the group Dr George D Beal, Assistant Director of the Mellon Institute of Pittsburgh who has recently been elected to serve as First Vice President of the AMERICAN PHARMACEUTICAL ASSOCIATION Dr Beal acknowledged the introduction

The officers and members of the Pittsburgh Branch were pleased to have as their guest so many members of the student's branch of the Pittsburgh College of Pharmacy A cordial welcome is extended to all pharmacists to participate in the activity of the Pittsburgh Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION

FRANK S MCGINNIS, *Reporter*

JOINT PHARMACY MEETING IN BALTIMORE

The Maryland Pharmaceutical Association and the Baltimore Retail Druggists' Association held a joint meeting at the Hotel Emerson, Baltimore February 14th It will long be remembered as a most helpful pharmacy meeting, the attendance was fine and the addresses of unusual brilliance and worth President L V Johnson of the State association, and President Simon Solomon, of the City association presided The afternoon session was devoted entirely to a discussion of business problems

Editor Jerry McQuade delivered a stirring address He covered hurriedly the conditions surrounding the preparation of the retail drug code expressed the feeling that the code was worthless and characterized it as a price cutter's code ' He gave special attention to some very recent developments which are being worked out by manufacturers independent retailers and chains, to bring about a better price situation throughout the country The plan will be under the local supervision of a committee to be selected Mr McQuade expressed himself as convinced that the plan would bring about much sounder business conditions

Nelson A Miller of the United States Department of Commerce, spoke on "The Economic Situation in the Drug Business ' Mr Miller has been associated with the St Louis Drug Store Survey for several months and much of his talk dealt with the facts and figures established by that study One very interesting thing brought out by him was his feeling that business conditions strongly indicate that retail pharmacists may anticipate a pick up in business of 30 to 35 per cent

Prof Marvin Andrews University of Maryland gave an up to date picture of the work being done by the Committee on U S P and N F Publicity of which he is chairman and submitted samples showing the many combinations suitable for prescribing official drugs he also referred to methods of dispensing proprietaries

President Aquilla Jackson of the Local Retail Drug Trade Council, presented a report which was well received which evidenced the confidence of the pharmacists in the members of the Council

The evening meeting was given over to a discussion of professional matters Two valuable addresses were delivered Dr G O S' arrett Cumberland president of the Medical and Chirurgical Faculty of Maryland delivered a most impressive talk It was an earnest candid and fearless talk and went to the very heart of many important problems

Chairman E Fullerton Cook of the Committee on Revision of the United States Pharmacopoeia, discussed the professional phases of pharmacy and gave special attention to the procedure followed in revision work

President Frank L Black, of the Alumni Association School of Pharmacy University of Maryland presided over the evening session

---

Michael Joseph Dausch of Baltimore has been awarded an annual membership in the AMERICAN PHARMACEUTICAL ASSOCIATION following a precedent of former years

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934–1935

Office of the Secretary, 2215 Constitution Ave Washington, D C

LETTER NO 6

February 2, 1934

To the Members of the Council

34 Contract for Printing and Mailing the Journal of the A Ph A for 1934 Motion No 7 (Council Letter No 5 page 65) has been carried and the contract has been awarded to the Mack Printing Company

35 Budget for 1934 Motion No 8 (Council Letter No 5, page 66) has been carried and the budget approved as submitted

36 Selection of Auditors Motion No 9 (Council Letter No 5, page 67) has been carried and the accounts for 1933 are now being audited by W A Johnson & Co

37 Election of Members Motion No 10 (Council Letter No 5, page 67) has been carried and applicants numbered 57 to 74 inclusive are declared elected

38 The Headquarters Building The removal of the offices and records of the ASSOCIATION from 10 W Chase St , Baltimore Md , to the Headquarters Building, 2215 Constitution Ave Washington D C was completed on January third The approach steps have been completed and the work on the grounds is progressing very satisfactorily The widening of Constitution Avenue is completed and the sidewalks will be laid within a short time unless the weather prevents

39 Use of the Text of N F V The following letter has been received from Chairman DuMez of the Committee on Publications

> For the past two decades to my knowledge Gould s Medical Dictionaries have been granted permission to use portions of the text of the National Formulary in the different editions of the dictionaries published by them, so I can see no reason why it is necessary for the Committee on Publications to again vote on this matter I will, therefore recommend that permission to use portions of the text of the National Formulary in the publication of the different editions of Gould's Medical Dictionaries be granted with the understanding that notice of the permission received be printed on the rear of the title page of the books published, and that the ASSOCIATION charge the customary fee of $5 for this privilege "

(*Motion No 11*) *It is moved by DuMez that the P Blakiston's Son & Co , Inc be given permission to use portions of the text of the National Formulary V in the preparation of Gould s Medical Dictionaries, and at the usual charge of $5*

40 American Association for the Advancement of Science The fall meeting for 1933 was held in Boston Mass , Dec 26–29, 1933 Dr John C Krantz, Jr , was appointed Councilor to this association for 1933–1934 by President Swain and attended the meeting as the representative of the AMERICAN PHARMACEUTICAL ASSOCIATION which is affiliated with Section N Medical Sciences

The AMERICAN PHARMACEUTICAL ASSOCIATION, by invitation of the officers of Section N held a joint session with the American College of Dentists on Friday morning as one session of Section N The program follows

Friday Morning Joint Session with the AMERICAN PHARMACEUTICAL ASSOCIATION and the American College of Dentists December 29 1933, 9 00, John Ware Hall Boston Medical Library, 8 The Fenway

John C Krantz, Jr , Second Vice President AMERICAN PHARMACEUTICAL ASSOCIATION, Presiding

1 "Pharmacy and Dentistry in Therapeutic Progress" Harold S Smith, chairman, and Samuel M Gordon secretary, Council on Dental Therapeutics American Dental Association

2 "An Investigation of the Viburnums and Their Medical Aspects" Heber W Youngken, Massachusetts College of Pharmacy

3 "Certain Scientific Aspects of Pharmacopœia Making" E Fullerton Cook, chairman of the Committee of Revision of the United States Pharmacopœia

4 "The Determination of Magnesium by Alkalimetric Titration" Milan A Logan Forsyth Dental Infirmary for Children and Harvard Medical School

Dr Krantz reports that the joint session was well attended and that the papers and their discussion were very interesting This is the first time that the AMERICAN PHARMACEUTICAL ASSOCIATION has participated in a program and the fine cooperation of Drs Krantz, Youngken and Cook is acknowledged No doubt but that this step will lead to a closer contact with the A A A S and its interest in the work of the AMERICAN PHARMACEUTICAL ASSOCIATION and in the scientific work being done in pharmacy is very encouraging

41 American Joint Committee on Horticultural Nomenclature Dr Heber W Youngken submits the following report

"I attended the meeting of the American Joint Committee on Horticultural Nomenclature held for the purpose of planning the revision of *Standardized Plant Names* at the Hotel New Yorker New York City on January 15th, and took an active part in the two sessions of this organization

"I shall prepare a detailed report of the proceedings of this meeting as a part of my annual report of the Committee on Horticultural Nomenclature to be submitted to the House of Delegates of our ASSOCIATION at its coming meeting in Washington However, for the present information of the President, the Council and yourself I am pleased to state it was voted to revise and enlarge the scope of *Standardized Plant Names* so as to include the scientific and common name of every plant yielding a drug spice or dye in American commerce as well as some other economic products, and your committeemen present were requested to submit a complete list of the common names of medicinal plants which the AMERICAN PHARMACEUTICAL ASSOCIATION desires included in the revision of this work The delegates present representing all but one of the constituent organizations showed marked interest in the problems of American Pharmacy as related to the work of standardizing plant names especially synonyms, and officers and members alike appeared desirous of granting our requests for changes and additions to the present work, which will extend its usefulness to the entire drug trade

I feel convinced that if all the plans for the revision of that work are carried out which were adopted at the meeting of January 16th the edition will prove a classic work on standardized plant names, and its adoption as such by a greatly increased clientele is anticipated The present work has already become the standard for plant names covered in a number of organizations and in the Dept of Agriculture"

Dr Youngken was authorized to attend this meeting by President Swain with the approval of Chairman Hilton of the Council

42 Buckram Binding for N F VI In order to secure the cloth required for the binding of Series A 25,000 copies of the N F VI before the advance in price, the Mack Printing Co purchased the cloth in July 1933, and will store it without charge until used They also printed and bound and have carried in stock about 2000 copies of the N F V for more than a year, to prevent an advance in price They now request that the ASSOCIATION give a three months note for the total amount $2587 43—$1026 for cloth and $1561 43 for N F V—to be reduced each three months as convenient The U S P made a similar arrangement for the cloth required

This suggested arrangement has the approval of Chairman Hilton of the Council

(Motion No 12) It is moved by Chairman Swain of the Committee on Finance that the secretary and treasurer be authorized to execute a note, payable in three months to the Mack Printing

Company, Easton, Pa , for $2587 43, with interest, and to renew the note, with reductions, as may be necessary

43 Applicants for Membership The following applications properly endorsed and accompanied by the first year's dues have been received

No 75 W H Treiber, Enter Square, Emmitsburg, Md , No 76, L B Lathroum, 735 E 20th St , Baltimore, Md , No 77, A A M Dewing, Centerville, Md , No 78, Charles William Abbott, North Pacific College of Oregon, Portland, Ore , No 79 Samuel Harold Culter, 1 Park Ave , Tuckahoe, N Y , No 80, Sister Agnes FitzSimmons, 16th St & Girard Ave , Phila , Pa , No 81 Edith A Kramer, 2308 N Fulton Ave , Baltimore, Md , No 82, W Wallace Smith, 125 N Howard St Baltimore, Md No 83, Ralph C Dudrow, Hyattsville, Md , No 84, H O Wicks, 7401 Harford Road Baltimore, Md , No 85, Frank C Purdum, 5500 Harford Rd , Baltimore, Md , No 86 S F Pettis, Canton, Mississippi, No 87, A Lester Batie, Laurel, Md , No 88 W H Clark, Market St , Pocomoke City, Md , No 89, H O Trowbridge, Kensington Md , No 90, Robert A Pilson, Main St , New Windsor, Md , No 91, W G Bridges, 1726 Hountted Rd , Columbus, Georgia, No 92, Howard B Lewis, 218 W Medical Bldg , U of Mich , Ann Arbor Mich , No 93 Albert William Lewing, 310 Erkenbrecher Ave , Cincinnati, Ohio, No 94 Marion D Falconer, 223 E Alberta, Anaheim, Calif , No 95 John F O'Brien 365 Winton Rd , Rochester, N Y , No 96 Gleb Alexander Popoff, 1453 7th Ave Apt No 2 San Franciso, Calif No 97, Henry E Kleinsorge, Jr , 1439 5th Ave , San Francisco, Calif , No 98, Jerome Royal Fletcher, 860 Ashbury St , San Francisco, Calif , No 99, Weshe Wilson Brown 398 Hayes St San Francisco Calif , No 100, Hoffmann Henry Siebe, 133 A Carl, San Francisco, Calif , No 101 Paul Lantrip, 1704 Alabama Ave , Jasper, Alabama, No 102, Chester Mearl Hauck, 9389 Courvile St , Detroit, Mich , No 103 Ernest Berger, First Nat'l Bank Bldg , Tampa, Florida No 104 Samuel Schwartz, 600 E 169th St , New York, N Y , No 105, Ina Lorene Griffith, Faculty Exchange, Norman, Okla No 106 Minoru Masuda, 506½ Maynard Ave , Seattle, Wash No 107 Faheem Minhail, American Mission Hospital Assiut, Egypt, No 108, Lawrence Davis, 10 354 12th St Detroit Mich , No 109, Manasset Kaprielian, Rue Vahr, Beirut, Syria, No 110 Sister Mary Adelaide 1026 Belmont Ave , Youngstown, Ohio, No 111 Everette A McArthur % Parke Davis & Co , Detroit, Mich , No 112, William J Ohland 17 Durrell St Verona, N J , No 113 Charles Albert Hudson 148 S Court St , Luray Va , No 114, Meyer Harry Goldberg, 1246 Broadway Lorain, Ohio, No 115, Norman Carl Fretthold 1547 Rosewood Ave Lake Wood, Ohio, No 116 Joseph Huber, 541 E 124th St , Cleveland, Ohio No 117, Roger K Lager, 2298 Murray Hill Rd , Cleveland, Ohio, No 118 Walter Anthony Knurek 1603 Copassett Ave Lakewood, Ohio, No 119 Nicholas Avellone 2362 E 79th St , Cleveland Ohio No 120, George B Merriam, White Sulphur Springs, W Va No 121 Carl C Caplan 1800 Penna Ave Baltimore, Md No 122, B M Brown, Lyons Georgia, No 123, R M Birely St Paul & 33rd Sts , Baltimore Md , No 124 Godfrey D Kroopnick 930 Whitelock St Baltimore, Md , No 125 Irving Freed 930 Whitelock St Baltimore, Md , No 126 Howard Hollingsworth College Sta Box 37 Pullman Wash , No 127, John Russell Vibber, College Sta , Box 668 Pullman, Wash , No 128, William Tombari College Sta Box 356 Pullman Wash , No 129 Maison Gabriel de Navarre, 12,206 Mendota Ave Detroit, Mich , No 130 Elvira Marjorie Silveira 3820 Shafter Ave Oakland, Calif , No 131, John H Beeler Vinton Louisiana

(*Motion No 13*) *Vote on Applications for membership in the American Pharmaceutical Association*

E F Kelly *Secretary*

LETTER NO 7

February 2, 1934

To the Members of the Council

44 Time of the 1934 Meeting Since the Madison meeting, careful consideration has been given to the best time for the Washington meeting and for the dedication of the Headquarters Building

The Government has been engaged in a number of improvements in the area surrounding our site which, unless completed, would have interfered with the dedicatory exercises These are either completed or are so far advanced as to be finished by April first

Due to the open weather the grading and topsoiling of our grounds are practically completed and a good part of the planting The remainder of this work will be completed by April first, probably earlier It is therefore now assured that these matters will not interfere

The District of Columbia Pharmaceutical Association has taken great interest in the arrangements for the meeting and is giving splendid cooperation through its officers and members The local organization is prepared to arrange for the meeting either in the spring or later

Chairman Dunning has favored holding the meeting in the spring, as expressed in the letter from him quoted below, but his recommendation could not be laid before the Council until the matters referred to above were satisfactorily adjusted Dr Dunning's letter is as follows

> "I consider it of the utmost importance that the dedication of the American Pharmaceutical Headquarters Building takes place in the spring of the year, preferably during the month of May and that the American Pharmaceutical Association Convention should take place at the same time The building was occupied and began to operate in January You will realize that when the building is opened to the public and to our membership and those especially interested in the work of our ASSOCIATION it will be difficult to maintain enthusiastic interest over a considerable period of time Many of those whom we wish to interest in making subscriptions to the necessary building fund especially those whom we hope will make substantial donations will have seen the building accepted it and will have, by fall, lost the first flush of their interest It seems obvious that the occupancy of the building should be quickly followed by its dedication and, thereby, avoiding any possible loss of enthusiasm and interest among those whom we are hopeful will provide the necessary funds to complete financial security
>
> "There should be no more difficulty in arranging for the meeting of the ASSOCIATION in the spring of 1935 than has been occasioned in having the meeting take place simultaneously with the Annual Special Convention at the same time of the year
>
> "I hope that the Council will approve my recommendation I would consider it most unfortunate if they did not

Dr Dunning also requested that emphasis be placed on the fact that more satisfactory arrangements for the dedication can be made in the spring when many of those whom we wish to have present, *including Government officials* will be in Washington

In the mean time, the views of the A A C P and of the N A B P were requested Chairman Jordan consulted the Executive Committee of the A A C P The concensus of opinion was in favor of the usual time for the meeting late in August or early in September and that a meeting in May will seriously interfere with the attendance from the colleges and also with the program of the A A C P The following is the closing paragraph of the last letter received from Chairman Jordan

> 'I think I have sent you enough of these comments to let you know that the school men are very much opposed to an early meeting and I think you can see why this is true I sincerely hope and trust that arrangements can be made that will be satisfactory to you and that will not call for a meeting prior to June 15th"

A meeting late in June would bring serious conflict with the annual meetings of a number of state associations which occur late in that month

President Gilbert and Secretary Christensen of the N A B P, express the belief that a May meeting will lessen the attendance from the boards and will interfere with their program

The general expression of opinion as secured from a number of individuals consulted, is that a meeting in May would be favored largely because of the dedication of the building and that the latter consideration should be paramount in reaching a decision for this year A number also favor a meeting in May in Washington because of weather conditions and because the City is more beautiful at that time than later

Satisfactory hotel and other arrangements can be made for the week of May 7th–12th which will be the most satisfactory time for the meeting if May is selected as these dates will conflict

least with the colleges of pharmacy and the boards, and corresponds to the time at which the U S P Convention is held

(*Motion No 14*) *It is moved by Dunning that the Eighty Second annual meeting of the A Ph A and affiliated organizations be held during the week of May 7 to 12, 1934*

In view of the necessity for an early decision, the chairman of the Council has approved the calling of a vote at this time If there is objection or if any member of the Council desires to comment the vote will be considered as tentative

E F KELLY, *Secretary*

REPORT OF THE CHAIRMAN OF THE COMMITTEE ON PATENTS AND TRADE-MARKS *

BY F E STEWART, CHAIRMAN

The time has come for me to resign as chairman of the Committee on Patents and Trademarks after many years of service in that capacity However, before doing so, I may be of service in calling attention to some of the important points that have been developed in relation to these laws as applied to pharmacy Attention has been repeatedly called to the fact that the object of the patent laws as defined in the Constitution of the United States is to promote progress in science and useful arts ' I do not believe that any person who is informed on the subject will contend that the patent laws of the United States as now applied to pharmacy have promoted progress in the science of the materia medica and related and mutually dependent arts of pharmacy and pharmaco-therapy The law requires that to be patentable an alleged invention must be an invention in fact and that the application for patent grant must 'contain a written description of the invention and of the manner of making constructing, compounding and using it, in such full, clear concise and exact terms as to enable any person skilled in the art or science to construct and use the same " It is perfectly evident that materia medica patents are granted by the Commissioners of Patents without complying with this requirement The patent law also requires that Every patent shall contain a short title or description of the invention or discovery, correctly indicating its nature and design Is this requirement complied with? And there are other important requirements Are they complied with? Send to the Patent Office for a copy of any patent relating to the materia medica and find out Copies can be obtained at the cost of a few cents And, if you find that these and other requirements demanded by the patent law have not been complied with remember that the patent is void and can be revoked You will find by referring to the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, Vol 20, No 1 January 1931, the report of our committee in which these and other requirements for obtaining patents are stated For the sake of all concerned pharmacy therapeutics, pharmaco therapeutic literature the U S Pharmacopœia, the educational institutions related to pharmacy and medicine, the practitioners of medicine and pharmacy and the public health, why not investigate the methods of the Patent Office in regard to the patenting of materia medica products and preparations and force the Patent Office to comply with scientific professional and legal requirements in relation to the granting of patents for medical and pharmaceutical inventions

And the same relates also, to the registering of trade marks Refer for information on the requirements of the trade mark law to the same report of our committee Find out what these requirements are and force the Patent Office to comply with them There is no use for you to consult your lawyers about it Consult 'Browne on Trade marks" and find out for yourselves what is required Consult first the report of this committee and then read up in Browne s excellent work on the subject After you have posted yourselves in this matter then appoint a disinterested committee of pharmacists and physicians and reputable manufacturing pharmacists for further study and consideration of the subject and then decide how best to force the powers that be to play square with all concerned

A vote of appreciation for his long and useful services was given Dr Stewart

---

* Madison meeting A PH A 1933

EIGHTY-SECOND ANNUAL MEETING, AMERICAN PHARMACEUTICAL ASSOCIATION AND AFFILIATED ORGANIZATIONS AND DEDICATION OF THE AMERICAN INSTITUTE OF PHARMACY, WASHINGTON, D C—MAY 7–12, 1934

The Council of the AMERICAN PHARMACEUTICAL ASSOCIATION has approved May 7th–12th as the dates for this important meeting because it is desirable to have the dedication exercises as promptly as possible, and at this time which corresponds to that of the U S P Convention it is probable that many of those whom it is desired to have present including Government officials will be in Washington The city is at its best at this period and very satisfactory hotel and traveling rates are being granted

The Government will have completed very extensive improvements in the area surrounding the Institute including the widening of Constitution Avenue to eighty feet and the intersecting streets are being repaved The grading and planting of the grounds will be completed early in the spring and the Building is now being furnished and equipped

Everything will be in readiness for this very noteworthy occasion for American Pharmacy when its permanent home and headquarters will be dedicated and when important plans will be considered for the work to be carried on in the Institute

The members of the District of Columbia Pharmaceutical Association will act as hosts to the visiting pharmacists and their families and friends The general committee of arrangements headed by President Paul Pearson of the District Association, is completing arrangements for the business and entertainment features of the program The Local Secretary the Headquarters Hotel and the hotel and transportation rates will be announced at an early date

In addition to the Meeting and the Dedicatory Exercises, Washington is unusually interesting and enjoyable to visitors at this time Congress will probably be in session all public buildings will be open and the splendid improvements made in recent years in your Capital City will be well worth seeing The improvements completed and in operation in the Lincoln Memorial section emphasize what a wonderful site the American Institute of Pharmacy occupies It should make every American pharmacist prouder of his calling because Pharmacy has such a commanding position for its headquarters and a building in full keeping with the splendid surroundings

---

FOOD, DRUG AND COSMETIC LEGISLATION

Nothing definite can be said regarding the outcome of food drug and cosmetic legislation now in Congress Senator Copeland modified the bill introduced by him it was referred to a sub committee and considered later by the Senate Commerce committee As a result, it is reported that Senator Copeland will revise his bill and a hearing will be held February 27th 10 00 A M briefs may be filed prior to that hour The announced plan is to limit the witnesses to five one to speak on general food and drug legislation and one representing each of the four groups Foods drugs cosmetics and advertisers Each group will assemble material and designate a speaker to present its argument

Senator Stephens and Congressman Black are sponsors for the Drug Trade Conference bill, Representative Virginia E Jenckes of Indiana has introduced the bill prepared by Charles Wesley Dunn

The hearing on February 27th will bring about a discussion of important points as viewed by the administration and of those not fully in agreement therewith It is to be hoped that the hearing will develop an acceptable measure or supply information which will enable Congress to amend the present law or enact a new measure It is not helpful to comment further at this time nor of great value to discuss features of the proposals The proposed bills have brought out constructive thoughts but in some respects have complicated the proposed legislation the importance of which deserves rational accord and not needless discord

Several speakers discussed the legislation before New York Branch AMERICAN PHARMACEUTICAL ASSOCIATION, abstracts of these discussions appear in this issue of the JOURNAL

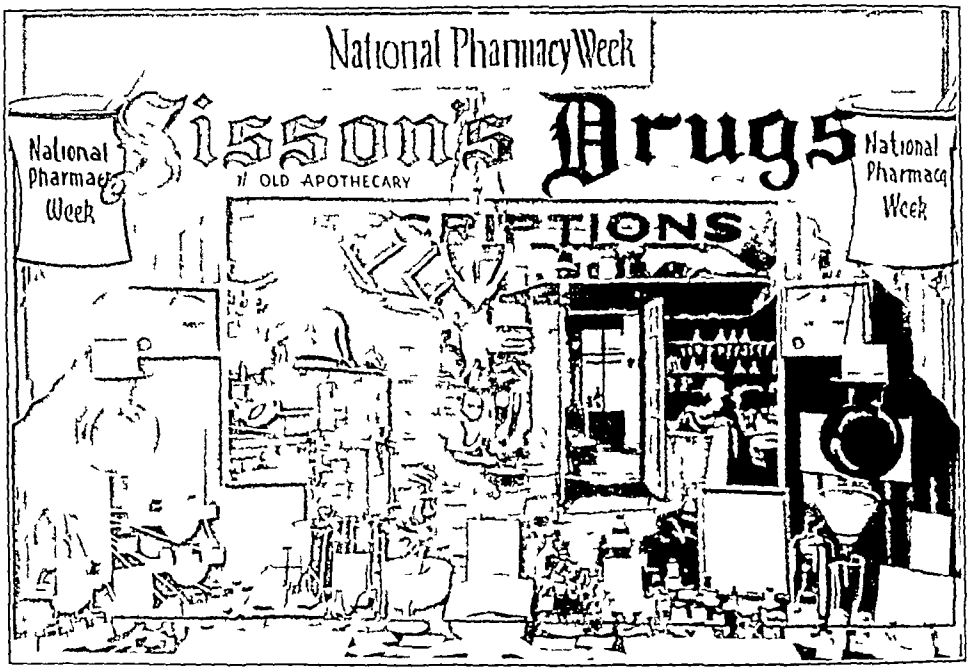
BALTIMORE BRANCH A PH A

The February meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION will be held at the Hotel Emerson on Tuesday February 27th

John A Strevig, of the Eli Lilly and Company, Indianapolis will present a sound film on "The Production and Clinical Application of *Insulin*"

PRIZE-WINNING PHARMACY WEEK WINDOW, 1933

The background of the window will be recognized as the "famous misnamed picture" described in the March JOURNAL for 1931, pages 236–246 entitled, "The Laboratory," from an



The Prize Winning Window, Pharmacy Week 1933

engraving by J D Murray of a painting by William Hunt At the left the sources of drugs are shown by connecting specimens with the globe In the picture are utensils used in prescription work and a dosage illustration is made by showing a bottle of Solution of Magnesium Citrate and a 1/400th grain of aconitine

Different forms of administration are shown and the foreground refers to a prescription from the Bible of the year 1491 B C , which gives the ingredients for an anointing oil

Mr Sisson's certificate and other personal records are displayed in the window

After completing the high school course in Schuyler, Nebraska, Mr Sisson entered the Chicago College of Pharmacy and graduated in 1894 In 1898, he opened a pharmacy at 5034 Cottage Grove Ave , Chicago later, he established a pharmacy on the second floor of 841 E 63rd St

Mr Sisson holds membership in national state and local associations and takes an active part in U S P and N F revision He keeps in touch with the Chicago Medical Society and during the time of the Pharmacy Exhibit at The Century of Progress" he gave his services for a day or more of each week

O U SISSON

He adheres to ethical advertising that embodies accurate and truthful statements He believes in giving credit to his employees for the work they do, thus, in a letter he refers to the part which two of his assistants had in making the window display, namely, Rollin Reineck and L B Jobusch

Mr and Mrs Sisson have two sons and a daughter The former are attending the Armour Institute and the daughter is a student at the University of Chicago

EDITORIAL NOTES

OPPORTUNITIES FOR PHARMACEUTICAL ORGANIZATIONS TO SHARE IN THE HEADQUARTERS

Chairman H A B Dunning in his address at the Madison meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION, referring to the progress of the American Institute of Pharmacy, said

'Three State associations have contributed special funds for designated purposes The Texas Pharmaceutical Association for furnishing the offices of the Editor, the Maryland Pharmaceutical Association for furnishing the offices of the Secretary, and the Kansas Pharmaceutical Association have not as yet decided for what their fund is to be used Suitable acknowledgment will be made of these splendid contributions and it is hoped that the other state associations will make contributions for special purposes, thus emphasizing the close relations between them and the AMERICAN PHARMACEUTICAL ASSOCIATION and associating the name of each of them with the project"

The dedication of the Headquarters and the annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION in Washington will bring ideas forward for sharing in the great work for American pharmacy It is hoped also to have complete sets of state and national proceedings, laws applying to pharmacy histories of early pharmacy, photographs of pharmacists who had a part in the development of pharmacy Individuals have copies of rare and old books which may serve a larger purpose if made part of the library or museum

CODE AUTHORITIES' CONFERENCE

A Code Authorities' Conference will convene in Washington, March 5th–8th President Roosevelt will address the first session, followed by Administrator Johnson The opening meeting will be held in Constitution Hall, among the considerations are named the possibilities of increasing employment, protections against destructive competition and excessive prices and monopolistic tendencies the elimination of inequalities and inconsistencies in codes the position of small enterprises and the many problems of code administration

In his invitation the Administrator asked for information concerning the effects of codes on operations, including employment in each industry on general price trends of products in each industry, and on unethical trade practices, as well as the effects of code provisions if any restricting production through limitation of machine hours or plant facilities, and the effect of codes on smaller concerns in each of the industries

In addition the invitation solicits suggestions to be presented during the conference for the modification, elimination or addition of specific code provisions, proposals for the elimination of overlapping of codes and for the financing of industry code administration

REPORT OF THE BUREAU OF NARCOTICS

The report of the Bureau of Narcotics has been issued in booklet form Editorial comment was made on page 278 of the April JOURNAL 1933, on 'The Narcotic Control Agreement' and in the July issue, page 596, on "The Ratification of the Narcotics Limitation Congress" President Franklin D Roosevelt has signed the agreement ratifying the Convention of Geneva on Narcotic Drugs

The comments referred to speak in a general way of this great work in control of the narcotic evil, to lessen the number of habitues and impress the harmfulness of misuse of narcotics and the report testifies to the possibilities of coöperation in public health matters Commissioner H J Anslinger has been doing effective work and on a number of occasions has spoken in appreciation of the cooperation of pharmacists

TONICS

A meeting of the Guild of Public Pharmacists (Great Britain) was held on January 17th Mr H N Linstead (secretary of the British Pharmaceutical Society) in the chair There was a large attendance to hear Dr J H Burn give a lecture on The Pharmacological Action of Some Well Known Drugs Professor Burn dealt in a most interesting manner with various drugs used as tonics and diuretics The word tonic he said was in common use not only among laymen but also among pharmacists and doctors it was therefore of interest to consider what was meant by a word which was used in many different senses Substances so varied as gentian, strychnine adrenaline alcohol thyroid and vitamin B might all be classed as tonics, and even then the list was incomplete When the heart was removed from the body and made to beat by saline infusions the application of strychnine had no effect The beat of the heart in the body was improved by strychnine, but to understand this one must consider the connection of the heart with the arterial system '

REVISION OF BRITISH PHARMACEUTICAL CODEX

Under the direction of the council of the Pharmaceutical Society of Great Britain reports are being issued preliminary to revising sections of the British Pharmaceutical Codex The report of the pharmacy sub committee presents a summary of the principal new or revised formulas recommended by it for inclusion in the revision The sub committee recommends the inclusion of formulas for a number of preparations from earlier pharmacopœias which are not included in the British Pharmacopœia of 1932, but are still in more or less frequent demand

THE NEW SWISS PHARMACOPŒIA

The new Swiss Pharmacopœia omitted 108 articles from the previous edition and has added 304 new articles they include chemicals that are now required in medical practice Very few drugs of animal origin have been officially recognized

The Swiss government signed the international agreement for the unification of the formulas of potent drugs with reservations permitting the Swiss Pharmacopœial Committee to deviate from the strengths of galenical preparations laid down in the agreement and also permitting variations in the nomenclature required by the agreement Nineteen articles of the Pharmacopœia differ from the requirements of the international agreement

The general principles of nomenclature of the previous pharmacopœia are followed In some instances the British and the United States pharmacopœias have been drawn upon for titles Standards for seventy drugs of formulas officially recognized are included Vegetable drugs are carefully described, but only few biological tests have been adopted, for digitalis, the digitoxin chemical test is given

THE ESSENTIAL OILS OF THE SWISS PHARMACOPŒIA

Ernest J Parry in the *Chemist and Druggist* states 'there are twenty seven essential oils described in the fifth edition of the Swiss Pharmacopœia Their description is preceded by a general monograph headed 'Olea Aetherea,' which purports to give a general account of their more usual adulterants But treatment of this kind is not suitable for such a work nor is it of any very practical value in most cases For example turpentine is to be detected by the formation of pinene nitroso chloride in the fraction boiling at 155–156° But all that this really does is to identify the pinene present which is a natural constituent of many essential oils Nor are the solubility specific gravity, boiling point and levorotation of sufficient value to indicate the use of gurjun balsam, copaiba or cedarwood oils as adulterants Chloroform and benzene can hardly be said to be adulterants of essential oils and need not have been mentioned Refractive indices are not quoted for the oils "

PERSONAL AND NEWS ITEMS

The *Deutsche Medizinische Wochenschrift* has entered on its 60th year, the occasion is celebrated by a special number which included the *Deutsches Tuberkulose Blatt*

The Rotary Club at Austin Texas, owns the home in which O Henry" lived for a number of years Various patriotic organizations, including the Daughters of the American Revolution, the Daughters of 1812 and the Daughters of the Republic of Texas have pledged themselves to gather O Henry relics to be installed in this one of William Sidney Porter's many homes

It was in Morely Bros Pharmacy where a counter blotter was found in which O Henry had written one of his earlier (unpublished) stories

Prof Freeman P Stroup is successor to the late Joseph W England as recording secretary of the Alumni Association of the Philadelphia College of Pharmacy and Science

Dr Eugene Maier has been appointed chief bacteriologist of the Merck Institute of Therapeutic Research, Rahway, N J He was formerly Research Assistant in the Rockefeller Institute and also bacteriologist at Bellevue Hospital, department of pathology

Dr A Richard Bliss, Jr, director of The Research Laboratories of The William A, Webster Company, Pharmaceutical Manufacturers, became vice president of the Company on February 6, 1934

Dr Robert W Morrison, formerly Associate Professor of Pharmacology in the University of South Carolina, is now assistant to the Director of Research of the William A Webster Company

George H Needham, fellow-member A PH A, in San Francisco, has been giving evening courses in microscopy and photomicrography, participated in by pharmaceutical, food and industrial chemists He is to address the San Francisco Teachers' Association on Critical Microscopy '

Robert L Swain, of the AMERICAN PHARMACEUTICAL ASSOCIATION, will deliver the "Founders' Day Address ' at the Philadelphia College of Pharmacy and Science, Februarv 23rd He is to receive the Ph M degree, *honoris causa*

The names of the ten men who stood highest in the vote of 4106 druggists on "What ten men make biggest news in the drug field? conducted by the *American Druggist,* are Carl Weeks, H V Arny John W Dargavel J H Beal, Wheeler Sammons John H Goode Louis K Liggett, W Bruce Philip, Charles H LaWall and E F Kelly Forty one hundred and six druggists voted

Samuel C Henry, former secretary of the N A R D, has been named a member of the Review Advisory Board by National Recovery Administrator Hugh S Johnson This Board is to observe the effect of NRA codes upon small enterprises The Board will meet for the first time February 26th

Walter G Hodge has been appointed national director of distribution for the William S Merrell Company, Cincinnati

Attention is directed to page 17 of an opening for a pharmaceutical chemist

TEMPLE UNIVERSITY GOLDEN ANNIVERSARY

Temple University, of Philadelphia, celebrated its fiftieth anniversary during the week of February 11th The University has a wonderful history As is well known, Russell H Conwell was its founder and the spirit which moved him in this undertaking has resulted in an institution of which Philadelphia may well be proud A memorial address was delivered on Sunday (February 11th), by Rev Dr N Joseph Toomey in the auditorium of the Temple Following this a presentation of the Conwell bust, by Boris Blai, was made in the great court of Mitten Memorial Hall

During the week displays of medical, dental and pharmaceutical products were open to the public, galenicals and processes were exhibited in the laboratories of the School of Pharmacy

On Wednesday, February 14th, there was a reception by the officers and directors of the pharmacy Alumni Association to the graduates and undergraduates of the School of Pharmacy At night there was a faculty and alumni banquet to guests and delegates from universities, colleges and associations The address was delivered by the Hon R S Copeland, U S Senator from New York

A Founders' Day celebration was held on Thursday, when the principal address was made by Dr Glenn S Frank, president of the University of Wisconsin

The late Dr John R Minehart, former dean of the School of Pharmacy was for many years an active member of the AMERICAN PHARMACEUTICAL ASSOCIATION

Dr H Evert Kendig is now the dean of the School of Pharmacy

DRUG-CHEMICAL DINNER

Reservations for the ninth annual dinner of the drug and chemical trades, to be held March 8th in the Waldorf-Astoria, New York City, under the direction of the Drug Chemical and Allied Trades Section of the New York Board of Trade, are now twice those of a year ago, according to Joseph Huisking, chairman of the reception committee and head of the drive intended to make attendance cross the 1000 mark this year Postmaster General James A Farley will be the principal speaker and plans call for broadcasting his speech over a national network beginning at ten o'clock

OBITUARY

L C BRENNER

L C Brenner, 42nd president of the Texas Pharmaceutical Association, member of the AMERICAN PHARMACEUTICAL ASSOCIATION, died January 22nd, at Memorial Hospital, Houston, Tex

The deceased was born at Wiesbaden, Germany February 5, 1863 After graduating from the Real Gymnasium, Wiesbaden, he entered the chemical laboratory of Prof Dr R Fresenius and a year later entered the Polytechnicum at Karlsruhe where he studied pharmaceutical chemistry graduating in 1884 In 1885 he came to San Antonio to visit his brother For a time, thereafter, he was employed in New Orleans and New York City coming back to Texas he opened a pharmacy at Belmont, which he operated successfully for three years and then disposed of it to engage in the drug business with J C Bright at Gonzales, subsequently, the firm of Brenner and Bright was consolidated with the firm of Peck & Fly under the name of Gonzales Drug Company of which in 1912 he became the sole owner

Mr Brenner was prominently connected with pharmaceutical organization work for more than a quarter of a century He took an interest in civic affairs served as alderman of Gonzales and for 15 years was president of its school board He was a member of the Masonic bodies in which he held presiding offices The funeral ceremonies at his home, in Gonzales, were largely attended

The deceased is survived by his widow, six children and nine grandchildren

E B HEIMSTREET

E B Heimstreet died December 16th, at his home in Lake Mills, Wis, after an illness of several weeks aged 85 years He was born at Lansingburg, N Y, January 3, 1818

Mr Heimstreet was largely responsible for the organization of the Wisconsin Pharmaceutical Association, serving as secretary for 32 years, and was a former president and secretary of the Wisconsin Board of Pharmacy He formerly operated stores in Jamesville and Palmyra and was associated with his son, Charles F, in a drug store in Lake Mills until he retired in 1925 He attended the Madison meeting of the A Ph A

Dr Edward Wight Washburn, chief chemist of the Bureau of Standards, died suddenly at his home in Washington February 6th, of heart failure He was a leader in research on the so called 'heavy water," and was the first to produce water containing high concentrations of the hydrogen isotype in considerable quantity, by the electrolytic method He was author of "Principles of Physical Chemistry," published in 1915 and of many research papers

---

SOCIETIES AND COLLEGES

AMERICAN PHARMACEUTICAL ASSOCIATION meets in Washington during week of May 7th

SCIENTIFIC SECTION, A PH A

Due to the earlier Convention date this year it will be necessary for those desiring to present papers before the Scientific Section to submit the title and a short abstract to the secretary several months earlier than usual Please give this matter your prompt attention so that a copy of the completed paper will be in the secretary's hands on or before the opening date of the Convention The officers of the Section desire your continued cooperation

F E BIBBINS, *Chairman*, Indianapolis
R L ROWE, *Secretary*,
c/o Parke, Davis & Co, Detroit, Mich

SECTION ON PRACTICAL PHARMACY AND DISPENSING

FIRST CALL FOR PAPERS

The First Call for Papers, Addresses, etc, to be presented before this Section is addressed to all those interested in the advancement of Practical Pharmacy As a fitting part of the ceremonies of dedicating the Headquarters Building of the ASSOCIATION, this year's meeting will be particularly important Therefore every professional pharmacist is cordially invited to take part in making this an outstanding series of sessions

All titles and abstracts should be forwarded to the secretary as promptly as possible so as to be listed in the program

M J ANDREWS, *Chairman*
R E TERRY, *Secretary*
715 S Wood St, Chicago, Illinois

CONFERENCE OF PHARMACEUTICAL ASSOCIATION SECRETARIES

To the Secretaries of State Pharmaceutical Associations

"Our next Conference will be held at the time of the meeting of the A PH A in Washington, D C You will have within the next few days copy of proposed questions for discussion, and it is hoped that each of you may find it possible to attend this Conference and take an active part in the proceedings and render your aid in making it possible for this Conference to accomplish the things of which it may be capable"

ROBERT C WILSON, *President*
CARL G A HARRING, *Secretary*
20 Glen Road Newton Center, Mass

SECTION ON HISTORICAL PHARMACY

The Historical Section of the AMERICAN PHARMACEUTICAL ASSOCIATION earnestly seeks the help and cooperation of its friends in preparing the historical program for the approaching annual meetings of the ASSOCIATION to be held in Washington

This meeting will mark the beginning of a new epoch in American pharmacy We are making history faster than we realize Our task is to record it just as accurately and as interestingly as possible

The present forward trends in pharmacy of necessity, rest upon the past Every phase of pharmacy which has transpired, although but yesterday, is history The story of your store, your apprenticeship, your local or state association would make interesting history Let us have it

Few professions afford so many angles of interest, for the writer, as does pharmacy You are asked to contribute to the Archives of American Pharmacy now housed in the new Headquarters Building in Washington

LOUIS GERSHENFELD, *Chairman*
C O LEE, *Secretary*,
Purdue University, Lafayette, Ind

SECTION ON EDUCATION AND LEGISLATION, A PH A

With the annual meeting occurring earlier than usual this year, the preparation of a program should begin at once To this end the officers of this Section are anxious to secure papers dealing with educational and legislative topics The success of our meetings depends upon an interesting program and this in turn requires the cooperation of the members A subsequent notice will contain suggestions as to topics but this does not preclude papers on other subjects within the scope of the Section The joint session with the Conferences of Law Enforcement Officials and State Association Secretaries will be continued and we hope that reports from all states will be received

Send your title to the secretary at an early date and make this meeting in the national capitol one befitting the dedication of our head quarters building

G C SCHICKS, *Chairman*
C W BALLARD *Secretary*,
115 W 68th Street, New York, N Y

STATE PHARMACEUTICAL ASSOCIATION MEETINGS, FEBRUARY TO MAY

Florida—at Daytona Beach, May 29th–31st
Illinois—May 15th–17th at LaSalle, Ill
Iowa—in Sioux City, February 21st–22nd
Kansas—in Salina, April 10th–12th
Louisiana—in New Orleans, May 12th–19th
Minnesota—in Minneapolis, February 13th–16th
Missouri—in Kansas City, April 24th–26th
Nebraska—in Omaha, May 7th–9th
Oklahoma—in Oklahoma City, April 17th–19th
Texas—in Mineral Wells in May, date not fixed

William D Thomas, druggist, of Hoosick Falls, N Y, has been elected to Congress for the twenty-ninth New York District

William D Jones has been appointed acting Postmaster of Jacksonville, Fla

NEW MEXICO PHARMACEUTICAL ASSOCIATION

New Mexico Pharmaceutical Association will meet May 23rd–24th, in Santa Fe The convention city was founded by the Spanish in 1605, but it has a prior history as an ancient Indian village, only St Augustine can claim rivalry in point of years It is anticipated that the meeting will be largely attended, the New Mexico Board of Pharmacy will meet May 21st and 22nd prospective candidates should address G H Sasser, secretary of the Board for application blanks

PROFESSIONAL PHARMACY EXHIBIT AT OKLAHOMA PHARMACEUTICAL ASSOCIATION

Oklahoma Pharmaceutical Association will hold its annual session in Oklahoma City in April A comprehensive professional pharmacy exhibit will be an interesting feature similar to the one featured at the convention of the Wisconsin Pharmaceutical Association in Milwaukee

BOSTON DRUG SHOW

The first Drug Show Health Fair and Beauty Bazaar ever held in New England is scheduled during the first week in April at the Mechanics Building in Boston A large number of the retail drug leaders of New England are lending their support to the show and the sponsorship of Governor Joseph B Ely of Massachusetts has been secured

HISTORY OF BOSTON DRUGGISTS ASSOCIATION

Walter R Dolliver has prepared a short history of Boston Druggists Association in booklet form Many names familiar to members of the AMERICAN PHARMACEUTICAL ASSOCIATION are included among those who have been and are active in the ASSOCIATION

DRUGGISTS CONGRESS IN CONNECTICUT

Druggists from all parts of Connecticut attended the first Pharmaceutical Congress and Exposition of the Alumni Association of the Connecticut College of Pharmacy at Hotel Taft in New Haven Ethical and commercial phases of the relation of the pharmacist to the public were considered and speakers and exhibits emphasized the strides made in the compounding of drugs

Dr Milton C Winternitz, dean of the Yale School of Medicine, stressed the close relationship between pharmacy and medicine in the early days of both professions and urged the cooperation of the pharmacists

FREE ANALYTICAL SERVICE GIVEN BY PHARMACY SCHOOL

Druggists throughout the state of Oregon are the beneficiaries of a unique service maintained for them at the State College here under the direction of Prof Lewis C Britt of the Oregon State College of Pharmacy A free analytical laboratory has been in operation right on the campus of the College since 1927, to assist Oregon pharmacists in keeping their drugs up to the highest standard of purity

The pharmacists claim that this is perhaps as close an example of coöperation between registered pharmacy and a college of pharmacy as the profession can show anywhere Dr Britt closely collaborates with Linn E Jones, secretary of the Oregon Board of Pharmacy, by whom all samples submitted by druggists for analysis must be approved As the state has no pure drug law the laboratory offers the only means of determining the purity of drugs not sold in the original unbroken packages The laboratory was established through the efforts of the Oregon State Board of Pharmacy

NATIONAL ASSOCIATION OF RETAIL DRUGGISTS

New Orleans has been selected for the 1934 meeting of the N A R D Dates September 24th–29th Thomas S Smith, of Wilmington, Del has been appointed member of the Executive Committee succeeding Ambrose Hunsberger of Philadelphia

NINTH INTERNATIONAL CONGRESS OF CHEMISTRY

The ninth International Congress of Pure and Applied Chemistry will meet in Madrid, April 5th to 11th A program has been arranged for April 3rd to 24th, giving those who attend an opportunity to visit interesting places of Spain

NEW JERSEY BOARD OF PHARMACY

Examinations for applicants for the Registered Pharmacist Certificate will be held by the Board of Pharmacy of the state of New Jersey on Thursday April 19th at the State House, Trenton, according to an announcement from the Board Office

All applications for the examination must be filed with the Secretary of the Board, 28 W State St Trenton, not later than March 19th

UTILIZING FARM WASTE

The Iowa State College has completed a new research laboratory devoted to the study of problems in connection with work on waste material such as corn cobs, hulls etc

CHEMICAL MANUFACTURING CODE

The basic code for chemical manufacturing prepared and advanced by the Chemical Alliance, was approved by the President, February 10th

LEGAL AND LEGISLATIVE

CODE CONFERENCE

President Roosevelt will address what probably will be the greatest gathering of leaders of industry and trade in the country's history—the conference of Code Authorities and trade association committees scheduled to be held in Washington, March 5th to March 8th

In his call for the conference, the opening sessions of which are to be held in Constitution Hall, General Johnson outlined the major purposes to include the consideration in public sessions of the possibilities of increasing employment protections against destructive competition and against excessive prices and monopolistic tendencies, the elimination of inequalities and inconsistencies in codes, the position of small enterprises, and the vast problem of code administration and the organization of industry for self-government "

ALTERATION OF LOSS LIMIT CLAUSE

It is expected that a hearing will be called At that time the druggists will be permitted to put in all the evidence they have tending to show the inadequacy of a small markup At the same time it is expected that a compromise proposal which has been worked out in the NRA will be presented for the druggists consideration

Just what this compromise proposal will be could not be learned at this writing, but it was expected that it would be made public when formal announcement of the hearing was made It is understood that the hearing will cover only the loss limitation provision of the retail drug code and will not affect the food code or the general retail code

MODEL STATE NRA LAW

Administrator Hugh S Johnson has made public a "model" State industrial recovery act which has been submitted to governors together with a diplomatically worded letter pointing out that NRA is deeply interested' in the passage of measures for cooperation with the Federal law and for elimination of conflicts Just how far the proposal could be advanced this year is not clear Relatively few states have regular sessions of legislatures in the even numbered years and while special sessions were set for this year in several some of these already have been held Twelve states to date have enacted NRA cooperative legislation New York, New Jersey Virginia, Ohio, Texas, California, Utah, Colorado, Wisconsin, Kansas, Massachusetts and Washington

Though the Administrator's idea looks toward the eventual continuance of codes past the emergency period the present proposal is purely an emergency plan worded to expire with the Federal industrial act, using as a preamble a declaration of state wide emergency similar in nature to the Congressional declaration on which the National Industrial Recovery Act is founded

The immediate problem which calls for state assistance is twofold A number of Federal judges hearing the relatively few cases so far in court have declared Congress cannot delegate power to regulate business which is not interstate Machinery for 100 per cent Federal enforcement might prove as cumbersome as prohibition enforcement, in the opinion of NRA officials

ONLY MEDICINE IS CALLED "GOOD FOR HEALTH" IN TEXAS

Only medicines and drugs can be labeled as good for the health, ' under a new ruling recently made by the Texas Pure Food and Drug Division of the State Health Department This means that advertising and window displays cannot include the statement that the product is 'Good for Your Health," or a similar statement

In view of this ruling bakeries in the state which are selling a wheat bread advertised as ' Good for Your Health," will be barred from continuing such advertising It is the opinion of the Pure Food and Drug Division that ingredients of bread and food do not belong in class of health remedies and so cannot bear "health" labels

MAIL-ORDER HOUSES OPPOSE PRICE FIXING

On February 17th, leading mail order houses placed before General Johnson a comprehensive study of price fixing under codes of fair competition and called upon him to eliminate provisions which compel manufacturers to post for the notice of all competitors current and future prices

The representatives suggested that collection and dissemination of current price information should be done by NRA administrators

and not by the industry itself through its code authority

VIRGINIA LEGISLATION

Liquor Control Act—H R 33, passed the House on February 1st, will allow druggists to sell whisky on prescription, but they must buy liquor supplies from control board stores Bay Rum must be sold on prescription It does not control wines and beer of 3 2% or less alcoholic content

Virginia Trades Practice Act does not define cost,' but an interesting provision makes cut prices unlawful if they tend to substantially lessen competition or unfairly injure a competitor

Fair Trade Practice Bill makes it unlawful to sell merchandise below cost, and defines cost" for the retailer as the invoice price or price paid for the goods plus overhead

VALIDITY OF 20 YEAR-OLD PRICE DISCRIMINATION IN UTAH

Attorney General Joseph Chez of Utah has brought suit against Safeway Stores, Inc, grocery chain, which will serve as a test of the validity of a twenty year old Utah law said never to have been argued in court

The suit alleges that the grocery firm did unlawfully and intentionally for the purpose of destroying the competition of an established dealer in similar commodity, to discriminate between different sections within Salt Lake City by selling commodities in one section lower than the price charged for such commodities in another section "

While the case does not involve drug stores, the test is being watched eagerly by druggists because of its application to drug price cutters who use similar tactics

NEW JERSEY STATE CODE

Under leadership of the New Jersey State Pharmaceutical Association, pharmacies, drug stores and other types of retailers handling drugs are cooperating to draw up a retail drug code for the state of New Jersey to offer greater protection than does the Federal code

This action is taken under a law passed by the New Jersey Legislature and approved by the Governor last September, giving the Governor power to set up within the state codes of fair ethics for different lines of business, similar to the power held by the President under the NRA This law says that the state codes may be approved by the Governor provided they are consistent with the federal codes, but "due regard, however, may be had for local conditions and local customs "

DRUGGIST S LICENSE SUSPENDED

License of a New York City pharmacist alleged to have been apprehended imitating a well known proprietary drug has been suspended by the New York State Board of Pharmacy, George W Mather, secretary, announces He states that drastic action was taken in this case because it was found that the pharmacist in question was manufacturing the imitation product himself Suspension is of indefinite duration, and the board can restore the license or permanently revoke it, as it sees fit

PHARMACISTS ASK REORGANIZATION OF MISSISSIPPI BOARD

A bill to reorganize the Mississippi board of pharmacy and strengthen the old law governing the profession of pharmacy in this state has been approved by the House Committee Under the new bill there is authorized an executive officer, who is secretary of the Board, to be charged with investigating the complaints against pharmacists with authority to employ counsel The new bill provides for a Board of Pharmacy of four members appointed by the governor from a list of twenty one submitted by the State Pharmaceutical Association The executive officer is to be nominated by the association and appointed by the governor

TREATY SERIES NO 863—NARCOTIC DRUGS

Editorial comment was made in the July number of the JOURNAL, page 596, on the ratification of the Narcotics Limitation Convention The transactions covering this important action is published in pamphlet form and may be obtained from the Superintendent of Documents, Government Printing Office Washington, D C, for 50 cents

---

We are in receipt of a souvenir booklet of the incorporation of Dartford as a municipal borough on September 13, 1933 Here the Wellcome chemical and galenical works are located The booklet is finely illustrated and bound, containing views of Dartford and an insignia of the Lord Mayor of London presenting the charter together with the official blazon of the borough of Dartford

BOOK NOTICES AND REVIEWS

Handbook of Chemotherapy By DR VIKTOR FISCHL, Departmental Director of the Schering Kahlbaum A G, Berlin, and PROF HANS SCHLOSSBERGER, Member of the Reich Board of Health, Berlin-Dahlem English translation by Dr A S Schwartzman H G Roebuck & Son, Publishers, Baltimore, 1933 410 pages Price $8 00

This English translation of the "Handbook of Chemotherapy" will undoubtedly be considered by all those engaged either directly or indirectly in pharmacological research as one of the most interesting and important recent publications of its kind The term chemotherapy as employed by the authors is the broader and more logical one introduced by a number of modern authors in opposition to the old and restricted word, *chemotherapy* which Ehrlich applied to the treatment of a few specific blood infections by intravenous injection of certain chemicals, which was expected to result in a *therapia sterilisans magna* There is no valid reason in modern experimental pharmacology and therapeutics for not applying the term chemotherapy to any and every clear-cut pharmacological effect produced by a definite chemical compound on a specific physiological function, and this is the sense in which the word is employed by Fischl and Schlossberger in their important work, the first volume of which is now available in English This volume of the 'Handbook of Chemotherapy" deals with the so-called 'metal-free" organic compounds producing specific pharmacological effects After a brief introduction, to which are appended references to the general literature on chemotherapy Chapter 1 begins with the acyclic chlorine compounds Chloroform, carbon tetrachloride and other chlorinated compounds are discussed in this chapter, and a description is given of their action in relation to their chemical structure Chapter 2 deals with the unsaturated fatty acids Here the reader will meet many drugs with which he is familiar and also numerous chemical derivatives from the plant world of which he has probably never heard before Thus, for instance, in addition to cod liver oil and its derivatives and the chemistry of chaulmoogra in all its ramifications he will be confronted by such substances as margosa oil, achaoti oil nastin, gamelan and a host of synthetic chemicals related to the various natural products described in this chapter A third chapter deals with simple benzol and naphthalin derivatives as well as with oxy- and oxo compounds In this section we have a discussion of the salicylates, the phenols, various anthelmintics and other compounds from the standpoint of chemotherapy and chemopharmacodynamic relationships Chapter 4 contains a short description of the amino acids succeeded by twenty-four pages devoted to the chemotherapeutic discussion of all the quinolin derivatives except quinine In this series are found descriptions of Fourneau 710, plasmochin, various amino quinolins, atophan and many other compounds Chapter 6 contains a complete discussion of quinin and its derivatives, universally regarded as among the most brilliant achievements of modern chemotherapeutic research The seventh chapter is devoted to emetin and its derivatives and here as is the case throughout the book, a resume is given not only of the pure chemistry but also of the pharmacology, toxicology and therapeutic data concerning the respective compounds Chapter 8 is devoted to a large variety of plant stuffs, including numerous glucosides and alkaloids, anthelmintics, antimalarial and antidysenteric substances Chapter 9 discusses the acridin derivatives, while Chapter 10 describes dyestuffs of every conceivable structure except those which contain metals Here we find a thorough consideration of the nitro and nitroso dyestuffs, such as picric acid and naphthol green, of azo dyestuffs, such as chrysoidin, trypan red, trypan blue and afridol blue, of the carbonium dyestuffs, such as malachite green, auramin, brilliant green, fuchsin, methyl violet, gentian violet and the eosins, of the azin dyestuffs, such as safranin, and of the oxazin and thiazin dyestuffs, including methylene blue Chapter 11 deals with certain colorless urea derivatives and particularly with the historical germanin, otherwise known as Bayer 205 Fourneau 309, naganol and moranyl, and the final chapter contains a brief discussion from a chemotherapeutic point of view, of blood serum of men and of certain types of apes

The first volume of the English edition of the "Handbook of Chemotherapy" excels in its physical make up the print being remarkably clear and legible, the paper of very fine quality and the binding of durable character Among the invaluable features of this work are the numerous and exceptionally clear formulas of

and not by the industry itself through its code authority

VIRGINIA LEGISLATION

Liquor Control Act—H R 33, passed the House on February 1st, will allow druggists to sell whisky on prescription, but they must buy liquor supplies from control board stores Bay Rum must be sold on prescription It does not control wines and beer of 3 2% or less alcoholic content

Virginia Trades Practice Act does not define cost ' but an interesting provision makes cut prices unlawful if they tend to substantially lessen competition or unfairly injure a competitor

Fair Trade Practice Bill makes it unlawful to sell merchandise below cost, and defines cost" for the retailer as the invoice price or price paid for the goods plus overhead

VALIDITY OF 20 YEAR-OLD PRICE DISCRIMINATION IN UTAH

Attorney General Joseph Chez of Utah has brought suit against Safeway Stores, Inc , grocery chain which will serve as a test of the validity of a twenty year old Utah law said never to have been argued in court

The suit alleges that the grocery firm did unlawfully and intentionally for the purpose of destroying the competition of an established dealer in similar commodity, to discriminate between different sections within Salt Lake City by selling commodities in one section lower than the price charged for such commodities in another section

While the case does not involve drug stores, the test is being watched eagerly by druggists because of its application to drug price cutters who use similar tactics

NEW JERSEY STATE CODE

Under leadership of the New Jersey State Pharmaceutical Association, pharmacies, drug stores and other types of retailers handling drugs are cooperating to draw up a retail drug code for the state of New Jersey to offer greater protection than does the Federal code

This action is taken under a law passed by the New Jersey Legislature and approved by the Governor last September, giving the Governor power to set up within the state codes of fair ethics for different lines of business similar to the power held by the President under the NRA This law says that the state codes may be approved by the Governor provided they are consistent with the federal codes, but ' due regard, however, may be had for local conditions and local customs "

DRUGGIST S LICENSE SUSPENDED

License of a New York City pharmacist alleged to have been apprehended imitating a well known proprietary drug has been suspended by the New York State Board of Pharmacy George W Mather, secretary, announces He states that drastic action was taken in this case because it was found that the pharmacist in question was manufacturing the imitation product himself Suspension is of indefinite duration and the board can restore the license or permanently revoke it, as it sees fit

PHARMACISTS ASK REORGANIZATION OF MISSISSIPPI BOARD

A bill to reorganize the Mississippi board of pharmacy and strengthen the old law governing the profession of pharmacy in this state has been approved by the House Committee Under the new bill there is authorized an executive officer, who is secretary of the Board to be charged with investigating the complaints against pharmacists with authority to employ counsel The new bill provides for a Board of Pharmacy of four members appointed by the governor from a list of twenty-one submitted by the State Pharmaceutical Association The executive officer is to be nominated by the association and appointed by the governor

Reprint from *Annales de l'Institut Pasteur* has been published on ' The Control of Cordage and Cat Guts " The authors are A Goris and A Liot

AMERICAN CHEMICAL SOCIETY

The American Chemical Society will hold its 87th meeting in St Petersburg, Fla , March 25th–30th Dean Townes R Leigh, of the College of Arts and Sciences is the general chairman of the convention, he was formerly dean of the College of Pharmacy reorganized in 1933 as a School of Pharmacy in the College of Arts and Sciences, B V Christensen is the director

The Florida Medicinal Plant Garden is operated under the supervision of the Depart ment of Pharmacognosy School of Pharmacy University of Florida Dean Leigh was presi dent of the American Association of Colleges of Pharmacy 1931–1932

Texas Pharmaceutical Association will probably change its time of meeting to June 18th–21st the place remains the same namely Mineral Wells Tex

The Copeland bill S 2800 replaces former bills by Senator Copeland Its purpose is to displace the present Act hearing on this bill will be held Tuesday, February 27th

DRUG STORES IN CUBA REOPEN AND PHARMACEUTICAL TRADE BECOMES NORMAL

On January 24th, retail drug stores in Havana reopened, and the medical strike (which in cluded nurses, hospital attendants, pharmacists, dentists, laboratory workers, undertakers—in fact, all branches of public health workers and professionals) was brought to a close with the signing of an agreement between the secretary of the Department of Health and the officials of the Medical Federation This agreement, based on 24 demands served to stop the strike which had left the island without health service except for serious emergency cases All drug stores were closed, but it was stated that the Federation would permit the filling of prescriptions in certain cases which they considered urgent —Assistant Trade Commissioner Kathleen Molesworth Havana

---

Dr Wolfgang Schnellbach noted the abstract published in the January JOURNAL on page 30 and refers to an article by him in the *American Journal of Pharmacy* for February 1929, on page 127 entitled Yeast Extract I Have Known and Satisfactory Applied Mass Excipient " The abstract published in the January number is from the *Weekblad* reference to which is given

We are glad to call attention to the article by Dr Schnellbach

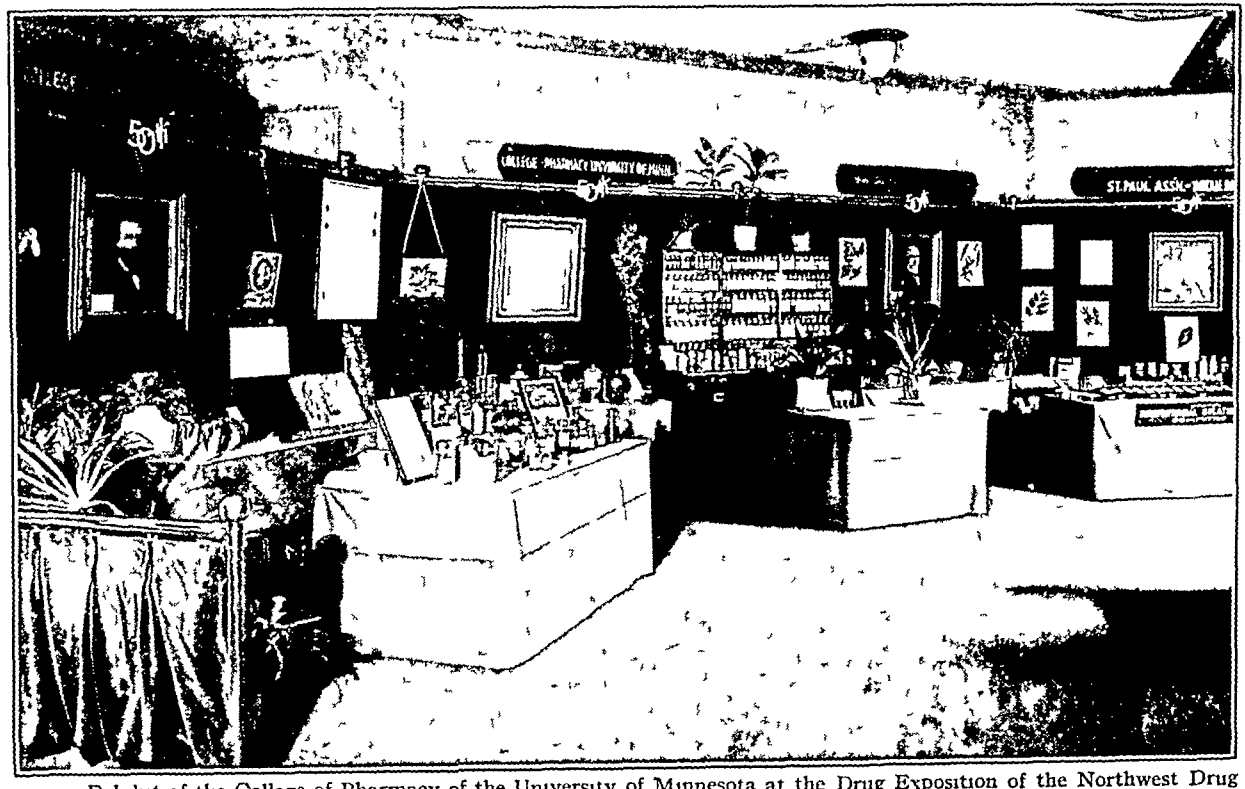

Exhibit of the College of Pharmacy of the University of Minnesota at the Drug Exposition of the Northwest Drug Bureau in the Municipal Auditorium, Minneapolis February 13 to 16, 1934 on the occasion of the Golden Anniversary of the Minnesota Pharmaceutical Association

FREDERICK J WULLING

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIII MARCH 1934 No 3

FREDERICK J WULLING

Frederick John Wulling, president of the AMERICAN PHARMACEUTICAL ASSOCIATION, 1916–1917, has been dean and member of the faculty of the College of Pharmacy of the University of Minnesota for more than forty years He was born in Brooklyn, N Y , December 24, 1866, the son of John J and Louise C (Munz) Wulling In 1883, he graduated from Carlstadt, N J , high school, after completing a course of study in a business college, he matriculated at Columbia University College of Pharmacy and graduated in 1887 Following graduation, the young man was named Associate Editor of the *Pharmaceutical Record*, in which capacity he served until 1891, when he accepted place as member of the faculty of Brooklyn College of Pharmacy

In 1892, Professor Wulling was elected member of the faculty and dean of the College of Pharmacy, University of Minnesota, and when, under his direction, the Medicinal Plant Garden was established he was named director During the War this garden contributed a great service by supplying standardized Tincture of Digitalis While an outstanding purpose of the garden is to cooperate with medicine and pharmacy in the educational promotions of the University and for the student bodies of these divisions, Dr Wulling brings its message to the citizens of Minnesota by acquainting them with native useful as well as dangerous or poisonous plants The University outlook and purpose is presented in radio and other addresses by the Dean for general information of the public in which the importance of professional pharmacy is stressed

Among the honors and degrees which Professor Wulling has received are Pharm D and LL B , University of Minnesota, Ph M , Philadelphia College of Pharmacy and Science, honorary Sc D , Columbia University He was trustee of the U S Pharmacopœial Convention 1920–1930, president of the American Conference of Pharmaceutical Faculties, 1914–1915, chairman of the Minnesota Academy of Sciences, 1910, is director of the Minneapolis Society of Fine Arts, fellow of the American Association for the Advancement of Sciences, and various literary

and social clubs, honorary member of New Jersey Pharmaceutical Association, member of Minnesota Pharmaceutical Association, and presides over the session of its scientific and practical pharmacy section at its meeting with Northwestern Branch A PH A

He is author of "Evolution of Botany," 1891, "Medical and Pharmaceutical Chemistry, 1894, "Chemistry of the Carbon Compounds," 1900, "Course in Law,' 1908

Dr Wulling married Miss Lucille Truth Gissel, of Brooklyn, in 1897, they have one son, Emerson G Wulling This sketch has been prompted by a service as dean of the pharmacy faculty of the University of Minnesota, covering a period of more than four decades

---

SIR HENRY WELLCOME, REMINGTON MEDALIST FOR 1934

Secretary Hugo H Schaefer, on March 16th, announced the vote of Remington Honor Medal Committee, naming Sir Henry Wellcome as Remington Medalist for 1934 The recipient has been a member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1875, a sketch is printed on page 573 of the July JOURNAL, 1925, see also January number, 1932, page 88, July, pages 644, 647

Mr Wellcome was knighted by King George and has been elected fellow of the Royal College of Surgeons He is the second person, not holding a medical degree, aside from members of the Royal Family, thus honored, the other recipient was Field Marshall Lord Roberts

His monumental sanitary work in various parts of the world is referred to at this time, because his report to the Secretary of War resulted in a greatly increased Government support of the methods and operations of General Gorgas in Panama He is director of the Gorgas Memorial Institute of Tropical and Preventive Medicine, Washington, which operates scientific laboratories at Panama for research relating to causes and prevention of tropical diseases

Sir Henry is a native of Wisconsin and a graduate of the Philadelphia College of Pharmacy The late Dr Frederick B Power[1] was director of the Wellcome Chemical Research Laboratories in London

On account of the lateness of publication the sketch of Sir Henry and outline of his activities will have to be deferred to the April issue of the JOURNAL

LOCAL COMMITTEES FOR THE 82ND ANNUAL MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION IN WASHINGTON D C, WEEK OF MAY 7TH

EDITORIAL

E G EBERLE EDITOR 2215 Constitution Ave , WASHINGTON, D C

A CORDIAL WELCOME

THE time and place for the 1934 meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION—Washington, May 7th to 12th—were selected to accord with the plans for dedicating the Headquarters Building The occupancy of this building which with other structures that may later be erected on the site will be known as the American Institute of Pharmacy, is one of the most important events in the long history of the ASSOCIATION and marks the successful completion of the most extensive and far-reaching effort the ASSOCIATION has undertaken The site, the building and the surroundings are beyond the expectations even of those who have been most active in the undertaking, and it is difficult to forecast the helpful influence which the institute will exert in the years to come American pharmacy now occupies its home and will be equipped to more effectively carry forward those activities which contribute to a stronger profession and to a better pharmaceutical service for the public

Every branch of pharmacy has had a part in this movement and thousands of individuals and organizations have contributed of their time and thought and money Its success is a distinct credit to the profession and to the industry, and is a striking example of what can be accomplished through cooperation With such a splendid foundation and equipment, even greater results may be expected and pharmacy should take its rightful place among the professions which safeguard the public health

The dedication exercises which will be held at the building on Wednesday morning, May ninth, will be simple and impressive With this exception, the usual program for the meeting will be carried out at the Shoreham Hotel which has been selected as the headquarters

The National Conference on Pharmaceutical Research will hold its sessions on Saturday, the fifth, in the afternoon and evening The American Association of Colleges of Pharmacy and the National Association of Boards of Pharmacy will meet Monday and Tuesday The joint banquet will be given on Tuesday evening and the regular program of the AMERICAN PHARMACEUTICAL ASSOCIATION will occupy the remainder of the week, closing Friday evening Saturday will be devoted to a sight-seeing trip around Washington, Arlington, Alexandria and Mt Vernon

The members of the District of Columbia Pharmaceutical Association will be the hosts Ample accommodations are available and a splendid program of entertainment is provided The Capital City is at its best at this time and all the points of interest will be open

A cordial invitation is extended to our members, to every one who contributed to the Headquarters Building, and others interested in the progress of Pharmacy, to attend the meeting and particularly the dedication on May ninth It is impossible to send a special invitation to every one and our earnest desire is that no one should fail to understand that the invitation is all-inclusive of those interested — ROBERT L SWAIN *President*

THE NRA MAY STRESS THE DRUGGISTS' RESPONSIBILITIES AND POINT TO THE WAY FOR IMPROVING DRUG STORE PRACTICE

THE codes which apply to the administration of the NRA have impressed the fact that greater efforts must be made to bring pharmacy forward in the average drug store and more careful consideration must be given to the sales in a drug store and the means of promoting them A very important question for druggists is associated with obtaining their share of the spending power of the public, but to derive it from sales that do not belittle them by selection and quality of side-lines The drug store has had the prestige of pharmacy and this may be obscured if not lost, if too much stress is placed on price, by reducing standard products to uneconomic levels, selling varied sundries and offering unwarranted premiums to attract patronage The public has always looked to the druggist for quality, accuracy and service—a valuation that may be lowered if a majority of drug stocks closely resemble the merchandise lines of non-related stores and "cut" prices emphasize that there is no difference in their kind and quality

The drug store's foundation, pharmacy, has always given the former a higher standing, but continued under-valuation of the foundation and a tendency to have drug stores resemble merchandise emporiums is molding public opinion accordingly The code relating to the retail drug industry has brought druggists, proprietors and clerks, face to face with the possibilities of lessened prestige The public has had a large part in the development of the complex drug store The following lines by a layman are quoted "I like drug stores It's reassuring to know that if you run out of anything, from aspirin to birthday greetings you need only to make a short promenade to the neighborhood pharmaceutical establishment" "So let there be drug stores They're not only soothing, they're even necessary"

THE VALUE OF RESPONSIBILITY

The matter of adequate charge for time is sometimes overlooked in prescription practice, and insufficient thought is frequently given to the responsibilities pharmacists assume in connection with their activities In these NRA days, perhaps more than ever before, the pharmacist must concern himself with actual net profit Liberty is taken in quoting from an article by J C Peacock, presented before the Section on Commercial Interests, A PH A , in 1917, which is applicable

"The responsibility of the pharmacist is of peculiar form, if for no other reason than that it is a by-product of his work, consequently, the more work, the more responsibility Responsibility is a condition of several phases, one phase of it is its part of or its presence in the mentality of the compounding, thus it is proportionately entitled to recognition, if the manipulation itself is worthy of notice, it is, therefore, not only service, but profound service, as service, it should be figured as expense, and as expense, it should be considered in the fixed charges and provided for accordingly" The author submitted the following

"That the responsibility of the pharmacist is part of the service which he renders in truth, the most profound part

"That responsibility seems to have been generally neglected as a source of revenue

"That it is thereby shown to have been underestimated by many

'That its possibilities should be understood and accordingly appreciated by all pharmacists, that it may rise in their own esteem to that plane where it belongs

That it should be capitalized at a value which prohibits it from being given away while the twine around the bundle is charged to the expense account

' That each pharmacist must do this for himself

'That now is the golden opportunity to correct this waste

"That suggestions and experiences be given toward the solution of this problem for the common good "

THE TREND OF PRESCRIBING IN GREAT BRITAIN

THE *Pharmaceutical Journal* (England) comments editorially on the trend of prescribing in Great Britain and makes references to the surveys made in the United States A few points of interest for American pharmacists can be gleaned from the editorial which summarizes three reports, one is a study of 40,000 prescriptions, the ingredients of which are to a limited extent restricted by regulations which obtain in dispensing under the National Health Insurance Acts, one is an analysis made in 1894 by W Martindale of 12,000 prescriptions, another, by B Cockburn, in 1913, of 1000 London prescriptions

Several deductions are of general interest, considering the first ten drugs and preparations of the three lists, it is found by the editor that the prescribing of quinine sulphate, potassium bicarbonate and aromatic spirit of ammonia has declined, sodium bicarbonate, tincture of nux vomica and ammonium carbonate have retained their places during the last forty years Potassium bromide shows a decline and the editor comments by questioning "Does this mean that bromides are being replaced by other sedatives, or is it an indication that in spite of psychopathists' warnings mankind is less in need of sedatives to-day than in quieter times of last century?" Another comment is of interest, namely, "that acetanilid, on which numerous adverse comments have been made, is prescribed with greater frequency than the newer analgesic"—(the reference applies to aspirin)

STATE LEGISLATION SUPPORTING NRA CODES

REFERENCE was made in the February JOURNAL to a "model" State industrial recovery act which has been submitted to governors Acting on the suggestion of Administrator Hugh S Johnson, State aid to the Federal Government in giving legislative force to NRA agreements as they apply particularly to intrastate industry and business is represented in measures by the legislatures of West Virginia and New Jersey The West Virginia act signed by Governor Krump places the police power behind code enforcement, the form follows the plan of Administrator Johnson

Two measures are under way in the New Jersey legislative bodies Assessment of industry to meet the cost of State Code enforcement with power in the State code authority to sue delinquents is the original purpose of the first measure, the second bill provides for a State appropriation to maintain the State recovery administration State authorities are denied the power to modify NRA codes, under a provision of the first bill Another provision requires the State recovery administration to permit an industry to convert from a state code to an NRA code, where a majority of the industry—majority as to number and as to volume of business—shall so elect

SCIENTIFIC SECTION

ABSORPTION OF VITAMIN D FROM THE SKIN *

BY FLORIN J AMRHEIN

HISTORICAL INTRODUCTION

For many years the workers in the field of nutrition have recognized the fact that certain food factors were responsible for many changes that occur in the human body Many experiments were conducted with various food materials It was found that pure carbohydrates, pure proteins, pure fats and pure mineral salts were not sufficient to maintain proper body needs and that the presence of other substances in food was apparently necessary

To Mellanby (1) belongs the credit of the discovery of the specific antirachitic factor, now known as vitamin D Mellanby, in his reports of 1918 and 1919, gave to the world the first accounts of experimental rickets developed in animals He used the dog and he showed that rickets could be cured by dietary means

Hess and Unger (2) in 1919–1920, believed that in the presence of another vitamin (now known as vitamin A), that rickets sometimes developed in infants receiving large amounts of milk which they believed contained large amounts of these fat-soluble vitamins

Sherman and Pappenheimer (3) in 1921 in their experiments showed that rickets may be caused by a disturbance in the mineral constituents of the foods eaten In their diets they used vitamin-deficient foods of all types Their experiments were not as conclusive as they might have been due to the fact that the animals used had not been completely depleted of their vitamin reserve It has been shown experimentally that the body is capable of storing vitamins for future use

About this time we find that Shipley, Park, McCollum and Simmonds (4) reported that the phosphate ions may have something to do with the apparent deficiency of calcium in the bones of the animals In 1921–1922 these same investigators made a comparison of the relative protective value of butter fat and cod liver oil when given to albino rats on a low calcium diet They reported that cod liver oil contains an abundance of some substance which directs the bone development and that it enables the animals to develop bones on a low calcium diet, but that butter contains only slight amounts of the substance

From this time up to the present we find that the literature on vitamin D has grown so that it is possible to find as many as one thousand references on the subject in all of its various phases Among some of the workers in the field we find the following Windhaus, Steenbock, Hess, Hoppert, Humphrey, Bogert, Trail, Nelson, Huldschinsky, Hyole, Poulsson, Bills, Holmes and Bliss

It is a generally accepted fact that this fat-soluble vitamin, vitamin D, is necessary in the diet in order to insure proper calcium metabolism If absent in the diet of infants and very young children it causes malformation of the skeletal structure

* Scientific Section, A PH A , Madison meeting, 1933

of the body and the disease is known as rickets In the adult its absence is said to cause the condition known as osteomalacia

During all of this experimental work it was found that sunshine was a good source of vitamin D, although certain conditions were necessary in order to get optimum results Wyman (5) in 1927, working at the Children's Hospital in Boston, found that much of the ultraviolet light, which is the source or activator of the vitamin, would be lost unless certain filters were used, and he also noted that certain types of glass completely absorbed the ultraviolet light and prevented its passage into the room

Steenbock (6) reported that the vitamin could be produced in foods that were exposed to the light from a mercury arc This process is now known as the process of activation of foods The process is protected by United States patents, and persons using the process are licensed by the Alumni Association of the University of Wisconsin who own the patent

Since the sun is nature's source of vitamin D it can be stated that before man covered his body completely with clothing he no doubt obtained much of the vitamin from the sun However, with the over-population of the large centers and with the advent of the custom of completely covering the body with clothing much of the beneficial effects of the sun rays were lost and more and more the human race became dependent upon the food supply for this vitamin

We may well ask what has all this to do with the calcium distribution in the human body? If we consider the structure of the skin we will find that in the subepidermal layer of the skin there are layers of fat cells which contain cholesterol This cholesterol becomes activated by the ultraviolet rays of the sun and in this way the body is furnished with the vitamin which in turn is absorbed by the skin capillaries and carried into the blood stream This complex reaction then is thought to cause calcium deposition

As has been stated modern man living primarily in the canyons of the large cities is for the most part deprived of nature's way of getting vitamin D This causes the various conditions previously described and therefore the medical profession recognizing this fact has attempted to overcome these natural inequalities by adding to the diet substances rich in vitamin D, such as cod liver oil and other fish oils

OBJECT OF THE INVESTIGATION

The object of this investigation is to determine under what conditions can vitamin D be absorbed from the skin This work was suggested by the work done by Hume, Lucas and Smith (7) in 1927 These investigators irradiated cholesterol and applied an oil solution to the test animals after first removing the hair of the animals and covering the spot so that the animals could not lap off any of the material They found that some vitamin was absorbed from the skin The author experienced some difficulty in using their technic on white rats, so during the course of the work a new method was developed which will be described in another place

DEVELOPMENT OF EXPERIMENTAL RICKETS

In order to produce experimental rickets the diet must be deficient in vitamin D, and it must also be abnormal in both calcium and phosphorus It has been

found that when diets contain calcium and phosphorus in the ratio of 2 parts of calcium to 1 part of phosphorus that normal bone is formed, but when the ratio of calcium to phosphorus is very high, *i e*, 4 to 1 or higher, that they produce a type of rickets similar to that found in infants Low calcium-high phosphorous diets will also produce rickets, but of a different type

The standard ricket-producing diet of Steenbock, No 2965, was used in the experiments Its composition is as follows

Diet No 2965

Yellow corn	76%
Wheat gluten	20%
Calcium carbonate	3%
Sodium chloride	1%

Calcium phosphorus ratio Ca P = 4 1

This diet is decidedly lacking in vitamin D and it has a high calcium to phosphorous ration, although by no means ideal in other respects it is sufficiently adequate to support growth and maintain satisfactory state of nutrition during the experimental period The rats are placed on this diet from twenty-one to twenty-eight days or until they show definite symptoms of rickets as indicated by their gait, etc

The animals are then lightly etherized and roentgengrams of the knee joints are taken Care must be exercised not to give the animals an overdose of ether as it will kill them This method of determining whether or not active rickets has developed in the animal checks each animal, thus assuring the rachitic condition of each animal, also the animal may be used for the repair diet The latter and the former are advantages of this method over the line-test method During the entire experimental period the animals are kept in darkened rooms, away from both daylight and sunlight

THE REPAIR DIET

Ordinarily the vitamin D containing material is either fed directly to the animals or it is mixed with the diet that is fed the animals For the purpose of this work it is obvious that the material cannot be fed to the animals but must be applied to the skin and then absorbed through the skin if possible

Among the materials used in this investigation are included the following peanut oil, unirradiated cod liver oil concentrate in peanut oil containing 6000 A D M A units per Gm, cod liver oil, U S P, irradiated cholesterol in creams The cream base consisted of vitamin D free substances as mineral oil, waxes and water One cream contained 1000 A D M A units and the other 3000 A D M A units per 120 Gm, respectively

AUTHOR'S RAT-TAIL METHOD

Pieces of pyrex tubing of the proper diameter (this depends upon the size of the rat's tail) were cut in lengths so that when the rat's tail is inserted into the tube about seven-eighths of it is encased by the tube The tube is sealed at one end and the other end is fire polished so that it will not cut the animal The animal is

then weighed without the tube The material is then spread on the rat's tail and the tail is then slipped into the tube The tube is fastened to the animal by means of adhesive tape The material is allowed to remain on the tail for twenty-four hours Each day the animal is weighed and its weight noted, the tube being removed first and also any adhering material during the 10-day test period The results obtained are of value only if the animal has consistently gained in weight during the repair diet period All food fed the animals is weighed each day and the amount left by each animal is also noted

Experiments were carried out on peanut oil in order to make sure that the peanut oil did not contain any vitamin D

TABLE I —RESULTS OF EXPERIMENT USING PEANUT OIL

Series I Rat No	Weight of Rat Beginning Test	Weight of Rat End of Test.	Gain in Weight
462	50 7 Gm	58 6 Gm	7 9 Gm
464	66 8 Gm	72 4 Gm	5 6 Gm
465	58 5 Gm	68 3 Gm	9 8 Gm
467	65 1 Gm	74 0 Gm	8 9 Gm

From the above table it will be seen that these rats continued to gain in weight when peanut oil was added to their diet, although examination of the roentgengram photographs attached at the end of the tables shows that active rickets are still in progress and that the oil does not contain vitamin D

RESULTS OF EXPERIMENT USING COD LIVER OIL CONCENTRATE DISSOLVED IN PEANUT OIL CONTAINING 6000 A D M A UNITS PER GRAM

This material represents the unsaponifiable material from cod liver oil Cod liver oil when treated with potassium hydroxide forms a soft soap This soap when extracted with ether yields in the ether extract a fatty wax-like solid which is not soluble in water, but is soluble in alcohol, fats, oils and waxes It is sterol in character and conforms to all of the requirements for a lipoid It has a distinct fishy odor The odor is fairly well disguised when dissolved in a bland oil-like peanut oil, although corn oil tends to accentuate the odor of the concentrate

TABLE II —COD LIVER OIL CONCENTRATE IN PEANUT OIL

Series II Rat No	Weight of Rat Beginning of Test	Weight of Rat End of Test	Gain in Weight
455	62 7 Gm	66 6 Gm	3 6 Gm
457	58 1 Gm	63 7 Gm	5 6 Gm
458	74 9 Gm	81 5 Gm	6 6 Gm
459	55 9 Gm	59 6 Gm	3 7 Gm
460	62 7 Gm	70 1 Gm	7 4 Gm
461	57 3 Gm	58 8 Gm	1 5 Gm

In this series excellent repair was noted as indicated by the photographs of the roentgengrams The experiments show definitely that vitamin D can be absorbed from oil solution

A comparison of the photographs of the roentgengrams taken of the hind legs of the animals used in Table III shows conclusively that cod liver oil, *i e*, the vitamin D from cod liver oil is absorbed from the skin

TABLE III —RESULTS OF EXPERIMENT USING COD LIVER OIL

Series III Rat No	Weight of Rat Beginning of Test	Weight of Rat End of Test	Gain in Weight
479	60 6 Gm	69 9 Gm	9 3 Gm
480	50 3 Gm	52 4 Gm	2 4 Gm
481	61 9 Gm	66 8 Gm	4 9 Gm
482	62 4 Gm	66 1 Gm	3 7 Gm
483	49 2 Gm	53 5 Gm	4 3 Gm

The experiments to this point indicate that vitamin D can be absorbed from the skin All of these tests, however, were performed on material of vegetable and animal origin The author was interested in the effect of mineral oil on the absorption properties of the skin, and so several experiments were conducted on creams prepared from mineral oil, wax, water and borax The results are indicated in the roentgengram photographs included in the report

The technic followed is the same as that already described

TABLE IV —RESULTS OF EXPERIMENT USING MINERAL OIL BASE CREAM CREAM CONTAINED 1000 A D M A UNITS PER 120 GM

Series IV Rat No	Weight of Rat Beginning of Test	Weight of Rat End of Test	Gain in Weight
472	62 8 Gm	72 2 Gm	9 4 Gm
473	61 3 Gm	64 9 Gm	3 6 Gm

TABLE V —RESULTS OF EXPERIMENT USING MINERAL OIL BASE CREAM CREAM CONTAINED 3000 A D M A UNITS PER 120 GM

Series V Rat No	Weight of Rat Beginning of Test	Weight of Rat I nd of Test	Gain in Weight
474	62 4 Gm	72 0 Gm	9 6 Gm
475	58 1 Gm	65 1 Gm	7 0 Gm

The experiments made on the absorption of vitamin D from the skin by Hume, Lucas and Smith (7) were performed on cholesterol that had been artificially irradiated For sometime the author has been interested in the problem of sun irradiation In his experiments he has found that several factors affect the success of the work However, experiments have shown that the sun may be used as a source of vitamin D when the proper technic and apparatus is used

The author has irradiated cholesterol and has incorporated this cholesterol in the cream base described above The roentgengram photographs show that vitamin D may be obtained by the sun irradiation of cholesterol provided the choles terol has not been highly purified It was found that cosmetic creams containing irradiated cholesterol caused repair to take place in rachitic rats

TABLE VI —RESULTS OF EXPERIMENT USING SUN IRRADIATED CHOLESTEROL IN COSMETIC CREAM

Series VI Rat No	Weight of Rat Beginning of Test	Weight of Rat End of Test	Gain in Weight
476	55 1 Gm	62 4 Gm	7 3 Gm

PHOTOGRAPHS OF ROENTGENGRAMS

This part of the paper deals with the photographs of the roentgengrams taken of the knee prints of the experimental animals The photographs that appear on

the left of the page under the title, "Beginning of the Test," indicate the stage of rickets developed in the animals due to being fed a diet deficient in vitamin D In each case it will be noted that marked rickets are present

The photographs that appear on the right of the page under the title, ' End of the Test Period," represent the condition of the bones after the animal had been on a diet containing antirachitic material With the exception of the experiments with peanut oil it will be noted that in each case the X-ray pictures show that distinct repair had been going on and in some instances complete healing had taken place

At the request of the publication committee the author has only submitted one roentgengram photograph of a rat in each series Other photographs will be sent to anyone interested in same

The author feels that it is entirely possible to use this method in quantitating the amount of vitamin D in material containing the vitamin and he is at present conducting said experiments

Photographs of roentgengrams indicating that peanut oil does not contain any antirachitic substances since no repair has taken place in the rachitic bones after the oil was added to the diet

PHOTOMICROGRAPHS

In order to establish the extent of repair and also to approximate the extent of decalcification that had taken place in the experimental animal's bones the author felt that photomicrographs of the bone sections were necessary

One of the hind legs of each animal was used for the purpose After fixing in 10% formalin for 48 hours the legs were prepared for the "Celloidin Embedding' blocking process and sections of the bone were used to prepare microscopic mounts Before mounting the sections in the usual routine manner, they were stained using "hematoxylin and eosin" Each photomicrograph represents about a 400 × magnification of the section

Examination of the photomicrographs clearly shows the following (1) the extent of decalcification that occurred in the bone during the development of experimental rickets, (2) the amount of repair or healing that took place during the ten-day repair period

These photomicrographs also serve as a check on the roentgengram findings or interpretations At the request of the editor of the JOURNAL and also the Committee on Publications these photomicrographs were omitted However, anyone interested may receive them by writing to the author

CONCLUSIONS

1 The object of the thesis has been achieved, namely, that vitamin D can be absorbed from the skin Also, the vehicle apparently has little or no effect in the absorption test, since the vitamin was absorbed from both vegetable and mineral oil bases

2 In this investigation the author has developed a new method for the administration of vitamin D-containing substances, namely, the rat-tail method for the absorption of vitamin D

3 That cosmetic creams may be used as a vehicle for carrying the vitamin substance has been demonstrated in two instances

4 That the sun irradiation of cholesterol that has not been too highly purified is practical and that this material may be used as one of the sources of the vitamin

5 Experiments are now under way for the quantitative estimation of vitamin D using the rat-tail method This method may be of value in assay work

6 It has been found that the presence of a small amount of vitamin A tends to produce more satisfactory results

FOOD AND DRUG LEGISLATION

No very definite progress has been made in legislation before Congress on the various Food and Drug bills The new Copeland bill, S 2800, was voted a favorable report by the Senate Committee on Commerce after amending it in many particulars The bill was reported to the Senate and has been printed in the Congressional Record for March 15th

The bill contains a new provision for the discretionary appointment of advisory committees representing the several trades and the public, but no provision has been made for an administrative board of review, as strongly requested by the activities affected

Other measures have not progressed and Senator Copeland is absent from Washington until about the end of March

ASSAY FOR VITAMIN B COMPLEX IN THE PRESENCE OF INTERFERING SUBSTANCES *

BY LLOYD K RIGGS, B J G CHIEGO, W L SAMPSON AND ANNABEL BEATY

In the usual method of assay for the vitamin B complex young rats are starved for this complex until a sharp decline of weight is observed The minimum dose of the material under investigation, necessary to restore a normal rate of growth, is then determined

In applying this method the following factors may well be taken into account (1) The accuracy of the method must obviously depend somewhat upon the nicety of judgment as to whether the normal rate of growth is restored or not (2) The interpretation of results is facilitated by the use of a physical standard of reference, a material of well-known vitamin B complex potency, to which all assays for this vitamin complex may be referred (3) The method is not quite generally applicable because of the fact that some food and medicinal products contain salts, drugs, laxatives, poisons or odd flavoring materials, which experimental animals either refuse to eat or from which complicated abnormal or ill effects follow In other specimens, the vitamin is in such dilution that a concentration must be made

1 TEST FOR THE RESTORATION OF NORMAL RATE OF GROWTH

It is frequently observed that litter mates of the same sex do not grow at the same rate even when kept under identical conditions of housing and diet When animals which have declined in weight due to starvation for the vitamin B complex are fed on several different doses of a given test material, animals on different doses may all gain in weight but it is frequently difficult to be certain that any one animal has been restored to its individual normal growth rate This element of uncertainty may be eliminated if at the end of the test period all test doses are discontinued and each animal is then given a daily dose of dried brewers' yeast which is known to be several times the minimum amount required for normal growth The growth curves of the animals are then followed for a week or two If the curve breaks upward with the feeding of the brewers' yeast, the previous dose of the test material was inadequate If the growth curve continues as when the previous dose was given, the previous dose was adequate for normal growth

2 PHYSICAL STANDARDS OF REFERENCE

In order to overcome the known variation in the response of animals to vitamin feeding this laboratory has adopted the procedure of making assays for the vitamin B complex comparative Various doses of a material to be tested for the vitamin B complex are fed in comparison with fresh bakers' yeast cake (Fleischmann) and dried brewers' yeast (Harris) Only a few animals need to be placed on doses of the yeast cake or of dried brewers' yeast, because it has been learned from several years of experience that 1500 mg of the fresh yeast cake is approximately equivalent to 100 mg of the dried brewers' yeast and that the vitamin B complex potency of these doses is just about adequate for normal growth of young rats It is also the experience of this laboratory that the dried brewers' yeast, when kept in closed con-

* Scientific Section, A PH A , Madison meeting, 1933

tainers, shows no detectable variations in potency over a period of about three years This material has, therefore, been adopted as a standard of reference for this laboratory The general adoption of some such standard would greatly facilitate interpretation of the results obtained by different laboratories

3 ASSAY OF A FOOD MATERIAL WHICH ANIMALS DO NOT EAT READILY

An attempt was made to assay the vitamin B complex in bouillon cubes[1] prepared from an extract of brewers' yeast and presumably containing vitamin B On account of the salts and flavoring of these cubes, experimental animals refused, after the first few days of the test, to eat the portions of bouillon cube supplied to them, either in the form of small (weighed) pieces of the cube or as similar amounts of the cube material mixed with some inert substance such as starch or dextrin For purposes of assay it was therefore necessary to devise some method for the extraction of the vitamin-bearing constituents of the bouillon cubes

The approximate composition of the bouillon cubes is indicated in the following table (Table I)

TABLE I

Moisture	5 84%
Nitrogen	3 54
Protein ($N \times 6\ 25$)	22 13
Ash	61 35
NaCl	55 02

I EXTRACTION EXPERIMENTS OF BOUILLON CUBES

A survey of the literature dealing with the properties of the vitamin B complex lead to a consideration of the three following possible methods for the extraction of the vitamin B bearing material from bouillon cubes

1 Extraction with dilute alcohol (approximately 70%)
2 Adsorption of the vitamin on fuller's earth
3 Extraction of the vitamin-bearing material with glacial acetic acid

Method No 1 was tried and discarded because it was found that a complete extraction by this method required repeated extractions and chilling of the extract in the refrigerator over night Such procedure results in so much exposure of the extract to the influence of atmospheric oxygen as to very largely destroy the vitamin B present in the original cube material

Method No 2 was tried and discarded because it was found that while it was very easy to adsorb a portion of the vitamin-bearing material on fuller's earth, there appeared to be no satisfactory way in which we might be assured that the vitamin-bearing material was quantitatively adsorbed The probability of a selective adsorption of the vitamin B factors was also taken into consideration

Method No 3—extraction with acetic acid—was finally adopted for use in this series of studies The method, as first tried, gave rather irregular results because of apparent differences in the amount of exposure to the air which occurred in the preparation of different batches of the extract A standardized procedure finally

[1] Yeast Bouillon Cubes—Harris, prepared by the Harris Laboratories, Tuckahoe, New York

was selected, after repeated trials, which yields rather uniform results This method of extraction is briefly described below

Ten bouillon cubes, weighing on the average 45 Gm , are crushed in a small mortar and washed into a small beaker with 135 cc of glacial acetic acid The cubes and acid are heated as rapidly as possible, with constant stirring, to boiling As soon as the mixture is boiling vigorously, the beaker is removed from the burner and the acetic acid-insoluble material is allowed to settle for a few moments The clear, supernatant liquor is then decanted through a funnel in which a filter mass of absorbent cotton has been previously moistened with glacial acetic acid

As soon as a small amount of the filtrate (acetic acid extract) is obtained, it is drawn, little by little, by vacuum, into a 150-cc weighed distillation flask The acetic acid extract is drawn into the distilling flask through a glass tube drawn out to a capillary so that the acetic acid solution falls into the flask a few drops at a time and evaporates almost as rapidly as it is delivered to the flask The flask is immersed in a water-bath kept at a temperature of 70° C The flask is connected by means of a Liebig condenser with a vacuum pump so that the acetic acid is distilled off under a high vacuum

The residue remaining in the beaker after the first extraction is again extracted with 100 cc glacial acetic acid and the acetic acid solution is decanted through the same filter into the same receiving flask The residue from this extraction is again similarly extracted twice with 50-cc portions of glacial acetic acid and then once extracted with 25 cc of glacial acetic acid The final portion of acetic acid (25 cc) is practically colorless and serves the purpose of removing all but the last traces of the acetic acid-soluble material which remains on the cotton filter through which each extract is poured

The vacuum distillation is continued during the time that the several extractions are being made, so that at the time the final extraction is completed, only a small amount of the acetic acid solution remains to be distilled As soon as all of the acetic acid solution has been transferred to the distilling flask, the inlet tube is connected to a reservoir of nitrogen gas and the distillation is continued under a stream of nitrogen until the final volume of the material in the flask has been reduced to approximately 60 cc

At this point in the procedure the flask is removed from the hot water-bath and the flask is cooled with either tap water or ice water The flow of nitrogen gas is continued during the cooling of the flask When the flask is cool, starch is added to the semi-solid residue and the flask is placed in a vacuum desiccator over sodium hydroxide sticks The desiccator is evacuated under the highest possible vacuum and the mixture of starch and extract of the cubes is allowed to remain in the flask in the desiccator for two days At the end of two days' time the vacuum is released with dry nitrogen gas and the flask with its contents is removed and accurately weighed The weight of the flask alone was taken before the experiment was begun Additional starch is now added in an amount which will bring the contents of the flask to three times the weight of the ten cubes taken for the extraction

It is obvious that three Gm of the mixture of starch and cube extract now contains approximately the same amount of acetic acid-soluble material as was contained in one Gm of the original cube This is the material that is fed to the experimental animals in testing the vitamin B (complex) potency of the bouillon

cubes If, then, we assume that all of the vitamin B complex is soluble in acetic acid and if we further assume that no losses have occurred during the laboratory manipulations to which the material has been subjected, we may then assume that the vitamin B complex potency of the starch mixture represents the vitamin B complex potency of the original bouillon cube in the proportion of three to one There is apparently no simple way in which the validity of the two essential assumptions upon which the third assumption is based, may be definitely verified It is almost certain that the second assumption is not entirely correct, because we find that if any delay in the extraction and distillation procedure occurs, a less potent vitamin extract is obtained A more correct statement of this assumption might then well be that, by standardizing as nearly as possible our procedure and making our extractions as rapidly as possible and with as little exposure to air as possible, we are able to make the extraction with a minimum loss of vitamin B complex potency

NOTE B Y = Brewers' Yeast, Y B C = Yeast Bouillon Cube, F Y C = Fleischmann's Yeast Cake

From the above it appears to us that the minimum vitamin B complex dose for normal growth of the young white rat is as follows

Brewers' yeast	100 mg
Bouillon cubes	300 mg
Yeast cake	1500 mg

II ANIMAL EXPERIMENTS

Some seventy-five animals were used in establishing the relative vitamin B complex potency of dried brewers' yeast (Harris), fresh yeast cake (Fleischmann) and yeast bouillon cube (Harris) It is not necessary to present the complete data obtained from all of these animals because the complete data are in strict conformity with the data of one typical test, using twenty-six animals, and employing the technic described above The data of this test are presented in Table II

It will be noted from the data of Table II that those animals that received daily doses of less than 100 mg of brewers' yeast, less than 300 mg of yeast bouillon cube and less than 1500 mg of fresh yeast cake, when changed from the test doses to 1000 mg of brewers' yeast showed a daily gain of weight greater than the daily gain of weight on the test doses Those animals receiving daily doses of at least 100 mg of brewers' yeast, 300 mg of yeast bouillon cube and 1500 mg of yeast cake do not show a marked increased rate of gain when transferred to 1000 mg of brewers' yeast

From these observations it is possible to draw the conclusions that 100 mg of the dry brewers' yeast, 300 mg of the material of the yeast bouillon cubes, and 1500 mg of the fresh yeast cakes are each adequate for the normal growth of rats for the period of this test

The vitamin B complex potency of yeast cakes and the yeast bouillon cubes used in these studies may be expressed in terms of the potency of the physical standard[1] employed in this laboratory as follows

$$\frac{\text{Minimum adequate dose of the standard}}{\text{Minimum adequate dose of bouillon cube}} = \frac{100}{300} = \frac{1}{3}$$

The bouillon cube then has a vitamin B complex potency of 33% that of the standard

$$\frac{\text{Minimum adequate dose of the standard}}{\text{Minimum adequate dose of yeast cake}} = \frac{100}{1500} = \frac{1}{15}$$

The yeast cake then has a vitamin B complex potency of 6 6% that of the standard

If one wishes to reduce the figures obtained to the basis of the dry materials contained in each product, it is only necessary to take into account the fact that the brewers' yeast contains approximately 1% moisture and that the bouillon cubes and the yeast cakes contain approximately 5 8% and 66% moisture, respectively Thus 99 mg , 286 mg and 495 mg of the dry material of brewers' yeast, of bouillon cube and of yeast cake, respectively, may each be said to contain one adequate dose of the vitamin B complex which might well be called one unit of the vitamin B complex

It might be well to point out that one bouillon cube weighs approximately 4 5 Gm (4500 mg) and that one yeast cake weighs approximately 12 5 Gm (12,500 mg) One bouillon cube will then contain

$$\frac{4500}{300} = 15 \text{ units of the vitamin B complex}$$

[1]Dried brewers' yeast—Harris

One yeast cake will then contain

$$\frac{12\,500}{1500} = 8\,33 \text{ units of the vitamin B complex}$$

We have found that a simple and convenient method for the graphic representation of the growth of animals which have been used in a test employing the technic described above is to lay off on cross section paper a line representing the weight during the test period, *i e*, a line joining the graphic points representing the weights at the beginning and the end of the test period A second line representing the weight of the animal during the period in which the excessive dose of brewers' yeast is fed is similarly laid off on the same paper The angle at which

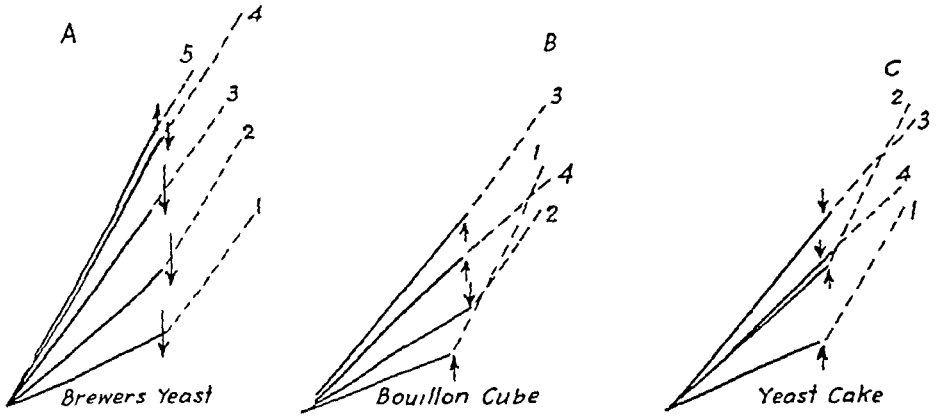

Fig 1

Curves No 1, 2 3, 4 and 5, division A, of Fig 1 are constructed from the composite weight figures of animals fed on 25 50, 100 150 and 200 mg of brewers yeast, respectively Arrows indicate the feeding of 1000 mg of brewers' yeast Curves 1, 2, 3 and 4, division B, represent animals on 100, 200, 300 and 400 mg of bouillion cube Curves 1 2, 3 and 4, division C, represent animals fed on 500, 1000, 1500 and 2000 mg of fresh yeast cake The upward breaks in curves 1 and 2 of each series indicate

25 mg brewers' yeast is inadequate for normal growth
50 mg brewers' yeast is inadequate for normal growth
100 mg bouillon cubes is inadequate for normal growth
200 mg bouillon cubes is inadequate for normal growth
500 mg yeast cake is inadequate for normal growth
1000 mg yeast cake is inadequate for normal growth

these lines intersect indicates any change in the rate of growth during the two periods In cases in which several animals are on each dose, the composite weight figures for the several animals may conveniently be used in the construction of such figures

The composite weight figures for the animals employed in this test were used for the construction of Fig 1

SUMMARY

1 A simple method is described for the extraction of the vitamin B complex bearing material from such food products as bouillon cubes prepared from an extract of yeast This extraction is by means of glacial acetic acid The acetic acid is removed by distillation in vacuum and in a stream of inert gas such as nitrogen

The paste remaining in the distillation flask is mixed with starch and aliquot parts of the starch mixture are fed as known doses of the material of the bouillon cube

It is obvious that this method will be inapplicable for the separation of the vitamin B complex from interfering substances which are soluble in glacial acetic acid

2 A simple method is described which employs each test animal used in an assay for the vitamin B complex as its own control Experimental animals, depleted of the vitamin B complex, are fed on given doses of the material to be tested At the end of the test period a daily dose of a material (dried brewers' yeast) known to contain several times the minimum adequate dose of the vitamin B complex required for normal growth is substituted for the daily dose of the test material under investigation If the growth curve breaks upward with the feeding of the large dose of brewers' yeast, the given dose of the test material was inadequate for normal growth

3 Dried brewers' yeast known to be stable for a period of at least three years is suggested as a physical standard of reference of assays for the vitamin B complex

4 It has been found that 100 mg of brewers' yeast, 300 mg of bouillon cube and 1500 mg of yeast cake are equivalent in vitamin B complex potency

THE COLORIMETRIC AND ELECTROMETRIC p_H DETERMINATIONS OF SOLUTIONS OF CERTAIN ALKALOIDAL SALTS *[1]

BY ALLEN F PETERS, B SC , AND ARTHUR OSOL, PH D

A review of the literature reveals several reports of investigations on the determination of the hydrogen-ion concentration of solutions of alkaloidal salts Evers (1) determined the colorimetric p_H values of solutions of the pure hydrochlorides of morphine, quinine and atropine and suggested the use of certain indicators which would give more accurate results in the titration of the corresponding free alkaloids McGill (2), and later Wagener and McGill (3), using electrometric methods of measurement, obtained values for pure quinine, morphine, strychnine and atropine salts Krantz (4), using a hydrogen electrode, determined the p_H values of pure quinine hydrochloride and also obtained data on the p_H values of quinine, strychnine and atropine dissolved in varying quantities of tenth-normal hydrochloric acid in excess

Masucci and Moffat (5) reported electrometric values for many commercial samples of morphine, codeine, quinine, strychnine, atropine and caffeine salts Wales (6) determined titration curves for various alkaloids and from these he obtained p_H values for pure salts Based on the latter, he recommended the use of certain indicators to minimize titration errors Finding great variations in commercial samples of alkaloidal salts, Eder (7) recommended the adoption of definite p_H limits for alkaloidal salt solutions More recently, Mellon and Tigelaar (8)

* Abstracted from the thesis of Allen F Peters, submitted to the Faculty of the Philadelphia College of Pharmacy and Science in partial fulfilment of the requirements for the degree of Master of Science in Chemistry [1] Scientific Section A PH A Madison meeting, 1933

compared the results of alkaloidal titrations using various indicators and constructed titration curves for atropine, strychnine and brucine

As many of the measurements reported in previous investigations were obtained from titration curves the authors of this paper considered it advisable to prepare certain pure salts from the corresponding pure alkaloids and to determine electrometric and colorimetric values of solutions of the salts The effect of dilution was likewise considered to be worth while investigating The results obtained in a study of this kind would be of value in setting p_H standards for testing for the presence of excess acidity or alkalinity in alkaloidal salts

EXPERIMENTAL

Pure brucine sulphate, strychnine hydrochloride, strychnine sulphate, quinidine sulphate and quinine sulphate were prepared by shaking a nearly saturated chloroform solution of the pure alkaloid with a quantity of the proper acid equivalent to approximately 75% of the alkaloid used The concentration of acid was sufficiently high to produce precipitation of the alkaloidal salt in the aqueous solution After filtration on a Buchner funnel, the salt was successively washed with chloroform, alcohol and water The residue was recrystallized from hot water, filtered, washed with water and dried between filter papers

Quinine bisulphate, quinine hydrochloride, quinine and urea hydrochloride and quinine hydrobromide were purified by repeated crystallization of commercial samples

The indicators listed in the tables were those which could be most easily matched with the standards Although slight precipitation was observed with certain solutions in the higher concentration range, the matching of colors was easily made

The results given for the electrometric determinations were calculated from electromotive force measurements of quinhydrone and tenth-normal calomel electrode combinations In the case of the higher concentrations of alkaloidal salt, the electromotive force measurements did not attain equilibrium, hence no p_H values are given in the tables While the cause of the instability of the potential is not known, it is, perhaps, connected with the precipitation which occurs in all solutions upon the addition of quinhydrone In the most dilute solutions the precipitation can be seen only with difficulty and the electromotive force remains constant within one or two millivolts, but with increasing salt concentration the precipitation becomes very noticeable and the potential too unsteady to measure Measurements made with hydrogen electrodes were, in general, also unsatisfactory

TABLE I —p_H OF QUINIDINE SULPHATE SOLUTIONS

Per Cent Salt	Colorimetric p_H (Chlorphenol Red)	Electrometric p_H	Commercial Sample
0 25	6 4	6 33	6 2
0 50	6 4	6 35	6 3
1 00	6 5	6 39	6 4

These values for quinidine sulphate are in good agreement with a value of 6 1 obtained by Wales (6) from titration curves for this salt

In Table I and the following tables are set forth the results of the p_H determinations of pure salts as well as commercial samples The water used in preparing the solutions was freshly distilled and was found to have a p_H of 6 2 when tested with isohydric chlorphenol red Solutions made with distilled water of $p_H = 5\ 7$ as well as solutions through which carbon dioxide-free nitrogen was bubbled rarely differed by as much as 0 1 p_H unit from the values given in the tables

TABLE II —p_H OF QUININE SULPHATE SOLUTIONS

Per Cent Salt	Colorimetric p_H (Chlorphenol Red)	Electrometric p_H	Commercial Sample
0 025	6 2	6 26	5 7
0 050	6 2	6 22	5 6
0 100	6 2	6 21	5 6

The values given in Table II are practically identical with the results obtained by Wales for quinine salts of strong acids, namely, 6 12

TABLE III —p_H OF QUININE HYDROBROMIDE SOLUTIONS

Per Cent Salt	Colorimetric p_H (Chlorphenol Red)	Electrometric p_H	Commercial Sample.
0 10	6 2	6 34	5 8
0 25	6 2	6 29	5 9
0 50	6 2	6 26	6 0
1 00	6 3	6 24	6 2
2 00	6 4	6 21	6 2

Here again the values are comparable with that given by Wales for quinine salts It should be pointed out that the colorimetric values increase while the electrometric values decrease slightly with increasing salt concentration The discrepancy, which is rather small, probably originates in the neglect of salt effects in both the electrometric and colorimetric methods as well as the precipitation which occurs when quinhydrone is used

TABLE IV —p_H OF QUININE HYDROCHLORIDE SOLUTIONS

Per Cent Salt	Colorimetric p_H (Chlorphenol Red)	Electrometric p_H	Commercial Sample
0 10	6 1	6 33	6 3
0 25	6 2	6 30	6 3
0 50	6 2	6 21	6 4
1 00	6 2	6 17	6 5
2 00	6 3	6 10	6 5
3 00	6 4		6 5
5 00	6 4		6 5

The corresponding values obtained by Krantz were 6 19 and 6 15 for 0 1% and 0 8% solutions respectively, while McGill reported values of approximately 6 0

TABLE V —p_H OF QUININE BISULPHATE SOLUTIONS

Per Cent Salt	Colorimetric p_H (LaMotte Yellow)	Electrometric p_H	Commercial Sample
0 10	3 6	3 54	3 6
0 25	3 6	3 38	3 6
0 50	3 6	3 30	3 6
1 00	3 6		3 5
2 00	3 5		3 5
5 00	3 5		3 4

No values for quinine bisulphate are available for comparison but Evers reports a value of 3 40 for quinine dihydrochloride

TABLE VI —p_H OF QUININE AND UREA HYDROCHLORIDE SOLUTIONS

Per Cent Salt	Colorimetric p_H (LaMotte Yellow)	Electrometric p_H	Commercial Sample
0 10	3 6	3 62	3 6
0 25	3 6	3 51	3 6
0 50	3 5	3 40	3 6
1 00	3 5	3 30	3 6
2 00	3 5		3 6
5 00	3 5		3 6

TABLE VII —p_H OF BRUCINE SULPHATE SOLUTIONS

Per Cent Salt	Colorimetric p_H (Chlorphenol Red)	Electrometric p_H	Commercial Sample
0 10	5 6	5 74	7 5
0 25	5 5	5 70	7 6
0 50	5 4	5 63	7 7
1 00	5 3	5 52	

For brucine salts Wales reports a value of 4 85

TABLE VIII —p_H OF STRYCHNINE HYDROCHLORIDE SOLUTIONS

Per Cent Salt	Colorimetric p_H (Chlorphenol Red) (Methyl Red)	Electrometric p_H	Commercial Sample.
0 50	5 6	5 62	6 1
1 00	5 5	5 42	6 2
1 50	5 4	5 35	6 2
2 00	5 3	5 16	6 3
2 50	5 3	5 12	6 3

Again Wales' value for strychnine 4 81, is lower than the values given in this table However McGill (2) reports values of 5 45 and 5 42 for 0 002 and 0 02 normal strychnine solutions respectively

TABLE IX —p_H OF STRYCHNINE SULPHATE SOLUTIONS

Per Cent Salt	Colorimetric p_H (Chlorphenol Red)	Electrometric p_H	Commercial Sample
0 50	5 8	5 83	5 2
1 00	5 8	5 74	5 1
1 50	5 7	5 68	5 0
2 00	5 6	5 61	5 0

From an inspection of Table IX it is evident that a slight difference exists between the values for strychnine hydrochloride and strychnine sulphate Whether or not the difference is real cannot be answered definitely

CONCLUSIONS

We have determined the electrometric and colorimetric p_H values of several pure alkaloidal salts Because of the precipitation which occurs when quinhydrone is added to the solutions, it is recommended that the colorimetric method should be used for routine work in testing for acidity or alkalinity of the salts reported in this paper

It has been found that, in general, the p_H values for a given salt solution are practically constant over a wide range of concentration

For a given alkaloidal base, it has been found that variation of the anion produces little if any change in the p_H values of solutions of the salt, provided the anion is of the strong acid type

It has been shown that the p_H values obtained from measurements of pure salt solutions are, in general, in good agreement with values obtained from titration curves

THE EFFECT OF ETHYLENE GLYCOL ON THE SERUM CALCIUM OF THE RABBIT *

BY JAMES M DILLE

A report of work done under the direction of C L Wible College of Pharmacy, University of Nebraska, in partial fulfilment of the requirement for the degree of Master of Science in Pharmacology

Ethylene glycol, commonly known as glycol, is a diatomic alcohol which stands midway between the monatomic alcohol, ethanol, and the triatomic alcohol, glycerol Because of this relation it has been suggested as a substitute for these two compounds It has been used as a preservative of fruit juices and extracts, and in non-intoxicating beverages (1) It has also been introduced as a vehicle for certain medicinal compounds not easily soluble in water Its use as a vehicle for iodobismuthite is an example of this

Ethylene glycol when used in the above ways has been considered harmless Reid Hunt (2), (3), however, has seriously doubted this, while Hanzlik (4) claims toxicity only in large amounts which are never given for therapeutic purposes

Hunt claims that the toxic effects of ethylene glycol are due to oxalic acid formed by the oxidative processes of the body This seems to be true because the presence of oxalic acid can be demonstrated in the urine after the administration of ethylene glycol (5), (6) Calcium oxalate is present in the renal calculi formed by the administration of small amounts of ethylene glycol given over a long period of time

In this work it has been assumed that if oxalic acid is formed it will precipitate the calcium of the blood as an insoluble salt, and thus cause a fall in the calcium content of the blood

EXPERIMENTAL

The experimental work was divided into two parts In the first part the calcium changes occurring as the result of the administration of toxic doses were determined The rabbit was starved 24 hours to eliminate the changes due to ingested food At the end of this period the first blood sample was taken The glycol was then administered and the samples of blood taken at approximately 15-minute intervals for the first hour, and then at half or hour intervals until death occurred

In order to determine the effect of excessive loss of blood on the calcium level a control rabbit was run for each experiment Physiological saline was administered instead of ethylene glycol Samples of blood were taken at the same intervals as in the experimental animal

Four experiments of this sort were run In two of them the glycol was administered intraperitoneally, in the other two the intravenous method was used

All four of these experiments checked each other closely The results of a typical experiment are embodied in Table I and Fig 1

In the second part of the experimental work the effects of small doses of ethylene glycol given over a period of time were determined

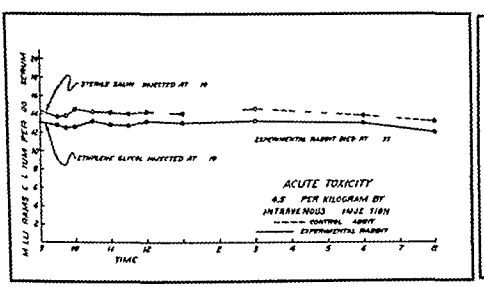

Fig 1

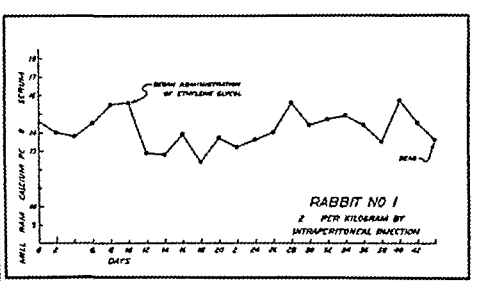

Fig 2

Calcium determinations were made on nine rabbits over a period of two weeks These were made every other day The daily administration of ethylene glycol was begun at the end of this two-week control period The intraperitoneal method of injections was used The rabbits were given doses varying from 3 to 4 cc of glycol per Kg per day

Diet is the cause of much variation in serum calcium, and in order to keep this as constant as possible, a diet of cabbage and oats was fed An excess of food was kept in the cage at all times The animals were kept on this diet a few days before starting the experimental period

A great deal of variations was encountered both in the control period and in the period during which the glycol was administered The accompanying table (Table II) and graph (Fig 2) may be considered typical of the results obtained in this part of the experimental work

In order to determine whether or not any deleterious results might occur from the loss of blood, hemoglobin determinations were made at the same time that the blood was collected In rabbits receiving the acute dose, the fall in the experimental animal was paralleled by a fall in the control rabbit In experiments on

chronic intoxication the hemoglobin remained constant during the two weeks' control period This indicates that the loss of blood required for the calcium determinations had no serious effect on the serum calcium After the administration of the glycol the hemoglobin fell

Serum calcium was determined by the method of Kramer and Tisdall (7), (8), using the modified washing technique of Clark and Collip (9) This is a volumetric procedure Calcium is precipitated from the serum, after the removal of the proteins, as calcium oxalate The precipitate is dissolved in sulphuric acid and titrated at 70° C against 0 01*N* potassium permanganate

44	13 6 mg	40	Dead
			Postmortem showed no adhesions, viscera appeared normal Stomach filled

DISCUSSION

Our experimental work seems to indicate that ethylene glycol has no marked effect on serum calcium This is established with fair certainty in the work with toxic doses Such variations as were present in the experimental animal were paralleled by variations over a similar range in the control

In the work involving the continuous administration of small doses, extensive fluctuations were noted throughout the course of the experiment, both in the control and experimental period These variations are probably due to diet It was thought that this could be minimized by keeping the diet as constant as possible, but this proved difficult McBorne and Campbell (10) state that normally the fluctuations of serum calcium may amount to as much as 5 or 6 mg per 100 cubic centimeters of serum Our variations over the entire period of the experiment amounted to 4 or 5 mg

Naturally it follows that any change in calcium due to the effect of ethylene glycol must needs be greater than the range of normal variations in order to be detected Therefore if there is any change, it is so small as to be covered by the normal variations

Oxalic acid is undoubtedly formed because in no other way can the presence of oxaluria, and calcium oxalate in the renal calculi be easily explained From our work we believe that the ethylene glycol is oxidized to oxalic acid so slowly that any change in serum calcium is too small to be easily detected

CONCLUSION

Variations in serum calcium of the rabbit do not depart from normal with the administration of ethylene glycol in toxic amounts or with small doses given over a period of time

A STUDY OF THE CONSTITUENTS IN CASCARA SAGRADA EXTRACT I ISOLATION OF A RHAMNO-GLYCOSIDE OF EMODIN *[1]

BY HORACE L SIPPLE, C G KING AND GEORGE D BEAL [2]

For more than fifty years cascara sagrada extracts have been under investigation in order to determine the chemical nature of the compounds which are responsible for the characteristic cathartic properties The extracts are usually classified as anthracene, anthraquinone or emodin cathartics, because the characteristic constituents separated have been derivatives of methyl anthraquinones Dohme and Englehardt (1) reported finding a substance present in cascara which resembled frangulin (m p 237°), but their conclusion was questioned by Jowett (2) Beal and Tumminkatti (3) and Daels (4) have shown that the anthraquinone-type substances present are in part free and in part combined in a form which is liberated by hydrolysis It is now generally accepted that the anthraquinone derivatives are present in part in a glycosidic type of linkage (5), (6) Thorpe and associates have reported finding a glycoside (frangulin) of rhamnose and emodin in Rhamnus frangula (7) Definite identification of the most active substance or substances remains to be accomplished, however This study of the separation of the chemical constituents of cascara sagrada extract has been made to obtain further information leading toward the identification of the cathartically active constituent or constituents A glycoside of rhamnose and emodin has been identified as one of the substances present in considerable quantity

EXPERIMENTAL

A procedure has been developed for the first stages of a separation of the chemical constituents in an alcoholic extract of the dry cascara bark The various fractions thus obtained were representative of types of material present, providing a

* The authors are indebted to the Parke Davis and Co for a research fellowship grant (for H L S), and for supplying the cascara bark

[1] Contribution No 276 from the Department of Chemistry, University of Pittsburgh

[2] Assistant Director, Mellon Institute of Industrial Research

basis for continued study of the individual compounds The chief steps in the procedure may be summarized as follows

1 A 300 Gm sample of dry cascara bark was ground to approximately 10 mesh and extracted with 2 liters of 96% ethanol in a modified Soxhlet extractor for fifty hours Extraction with ethanol rather than water prevents hydrolysis of glycosides (an undesired side reaction that would occur in an aqueous extract due to the action of accompanying enzymes), thus affording greater assurance that any products isolated would represent original constituents of the bark The substances extracted by ethanol are chiefly water-soluble compounds Except for a small amount of lipid material they are precipitated from alcoholic solution upon the addition of solvents such as ethyl acetate ethyl ether isopropyl ether, petroleum ether, benzene or chloroform

2 The alcoholic extract was filtered, evaporated *in vacuo* below 50° C to approximately one-tenth of the original volume, treated with eight volumes of water and filtered

3 The filtrate was stirred for two hours with approximately 35 Gm of ferric hydroxide in suspension to give a clear filtrate which would not cloud when stirred with saturated NaCl solution

4 The liquid phase from step 3 was treated with 300 cc of a saturated solution of neutral lead acetate ($(CH_3COO)_2Pb\ 3H_2O$) and filtered, the small amount of precipitate formed being discarded

5 A basic lead complex was precipitated at a p_H of approximately 7 4 (phenol red) by the addition of dilute ammonium hydroxide The lead complex was centrifuged, the supernatant liquid decanted and discarded

6 The lead complex was decomposed in concentrated sodium sulphate solution, the mixture being made slightly acid with acetic acid Lead sulphate formed was removed by centrifuging and decanting the liquid phase Reagents such as phosphoric acid sulphuric acid and hydrogen sulphide have been avoided because of undesired side reactions which might occur

7 The decanted liquid was evaporated *in vacuo* to 100 cc , treated with 4 volumes of methanol and filtered Salts such as sodium sulphate, lead sulphate and some sodium acetate were precipitated More salts chiefly sodium acetate, were removed by evaporating the liquid to 50 cc and filtering

8 The liquid fraction was treated with one volume of absolute methanol, forming a brown precipitate which was centrifuged and discarded

9 After evaporation to one-half the original volume, the liquid fraction was treated with one volume of absolute ethanol A brown precipitate formed slowly The mixture was allowed to stand in the refrigerator over night, centrifuged and decanted

10 The liquid fraction after evaporation to dryness, *in vacuo* was taken up in 10 cc of absolute methanol The small amount of material not soluble in methanol was centrifuged and discarded

11 The methyl alcohol solution was treated with five volumes of absolute acetone causing the formation of an orange red precipitate The precipitate was separated in the centrifuge washed with acetone and all liquid phases combined

The precipitation of this acetone insoluble material was repeated until a uniform and reproducible product was obtained This product was then washed once with absolute acetone and dried *in vacuo* over calcium chloride The amount of this material recovered was approximately 5 Gm per Kg of original bark

12 The liquid phase from step 11 was evaporated *in vacuo* to a volume of 10 cc and treated with ten volumes of petroleum ether precipitating a small amount of red, oily material A very small amount of a yellow, wax-like substance was recovered by decanting and evaporating the petroleum ether liquid phase

The purified acetone insoluble material obtained in step 11 did not reduce Benedict's reagent An ether extract of an aqueous solution of the material gave no coloration with dilute ammonium hydroxide, indicating the absence of free hydroxy-methylanthraquinones (8), (9)

A 0 1-Gm sample of the orange-red material treated with 1% HCl in a boiling water-bath for 30 minutes gave a positive test with Benedict's reagent, and an

ether extract of the hydrolyzed material treated with dilute ammonium hydroxide gave the pink coloration characteristic of a free hydroxy-methylanthraquinone

A 2-Gm sample dissolved in a mixture of 70 cc of ethanol, 30 cc of water and 6 cc of HCl (concentrated), and heated on a boiling water-bath for eight hours gave water-soluble and water-insoluble products of hydrolysis After dilution with three volumes of water and evaporation *in vacuo* below 50° C in a stream of CO_2 to a volume of about 75 cc , the liquid was filtered in order to remove the water-insoluble product

The product removed by filtration was recrystallized from glacial acetic acid and, after drying over NaOH *in vacuo*, had a melting point of 250° C With pure emodin it gave a mixed melting point of 249° C The pure emodin had a melting point of 251° C It was concluded that this product of the hydrolysis was emodin

The water-soluble fraction, after neutralization with silver carbonate and decolorization with charcoal, was evaporated *in vacuo* below 50° C to a volume of approximately 20 cc The specific rotation recorded was approximately +5 0

The optical rotation of the unhydrolyzed glycoside from step 11 could not be determined readily because of the deep red color of solutions of the substance

The phenylosazone of the water-soluble product of hydrolysis gave a melting point of 181° C , and mixed with rhamnose phenylosazone gave a melting point of 179° C Rhamnose (Merck) gave a phenylosazone melting at 180° C

A portion of the water-soluble fraction distilled with HCl (sp gr 1 06) gave a distillate that colored aniline acetate paper yellow, a test for methyl furfural (5) It was concluded that the hydrolysis product soluble in water was rhamnose, and that the compound hydrolyzed was a glycoside of rhamnose and emodin

The recrystallized glycosidic substance (step 11) was inactive as a cathartic in doses of 120 mg (extract from 3-Gm bark) when given to mice The guinea pig dose was above 300 mg of the dry material Pure emodin fed to mice in 5-, 10- and 20-mg doses was also apparently inactive, although possibly slightly active at the 20-mg level

The minimum cathartic dose for mice of a concentrated aqueous extract of cascara sagrada was found to be equivalent to the extract from 50-mg bark The minimum dose per 250-Gm guinea pig was equivalent to the extract from 300 mg of bark

The alcoholic extract of cascara sagrada fed to mice was active in doses equivalent to the extract from 50 mg of bark According to Munch (11) the approximate minimum human dosage is equivalent to the extract from 1 Gm of bark

SUMMARY

A procedure has been developed for the first stages of a separation of the chemical constituents in an alcoholic extract of cascara sagrada

A glycoside of rhamnose and emodin has been identified as one of the substances present in this alcoholic extract

Biological tests have been made of the cathartic properties of (*a*) the rhamnose-emodin glycoside, (*b*) pure emodin, (*c*) an aqueous extract of cascara sagrada and (*d*) an alcoholic extract of cascara sagrada

STUDIES IN PERCOLATION *

BY MILTON WRUBLE

DETANNATED TINCTURE OF CINCHONA

Tinctura Cinchonæ Detannata was official in the N F 1886, 1896 and 1906 The tannins were removed from the tincture as the name implies As early as 1866, Walker (1) briefly described a method by which he prepared a fluidextract of cinchona of a beautiful red color which held the cinchotannates in solution, by percolating with diluted alcohol Meumann, in 1886 (2), discussed the method for preparing detannated tinctures by means of ferric hydroxide His method could be applied to any drug but was outlined for cinchona The ferric hydroxide magma was added to the bark and intimately mixed The mixture was transferred to a percolator and percolation allowed to proceed

A year later, Meumann published a second paper (3) in which he recommended 2 parts of ferrous sulphate to 3 parts of bark Remington (4), in 1887, furnished a formula for the detannated tincture according to which the U S P fluidextract was treated with ferric hydroxide In 1888, Tiarks (5) reported on the method generally employed for preparing detannated fluidextracts He mentions the use of albumin, gelatin, lime and ferric hydroxide Keutmann (6), in 1903, described a method for detannating cinchona by percolating a mixture of the bark with calcium hydroxide after first forming a magma of the two with water and adding ammonium carbonate It is doubtful whether he obtained a completely detannated tincture since he reports a cherry-red color for the preparation made in this manner, whereas a completely detannated tincture is yellowish in color However, the red color may have been due to cinchona red (not to cinchotannic acid) which is reported to be *soluble* in ammonia water

Experimental Part—Cinchona bark, No 20 powder was used When assayed according to the U S P X, it yielded 4 70%, 4 32% and 4 26% of total alkaloids in as many assays The tannin content was determined by the hide powder method (7) Three determinations yielded 4 18%, 4 17% and 4 46%, respectively

* Scientific Section, A PH A , Madison meeting, 1933

The alkaloids of cinchona bark are supposed to be combined, in part at least, with cinchotannic acid No therapeutic value, so far as alkaloidal action is concerned, seems to be attached to this peculiar combination (8) Inasmuch as cinchotannic acid, under certain conditions changes to cinchona red, an insoluble phlobaphene, the presence of the cinchotannic acid is supposed to be responsible for unsightly depositions in the tincture and other galenical preparations Moreover, it has been reported that the cinchona red, as it is formed and deposited, occludes alkaloid Hence, the formation of a deposit in the tincture is not only a cause of unsightliness, but may bring about a reduction in the alkaloidal content as well (9)

It seemed desirable, therefore, to remove the cinchotannic acid from such preparations in which this agent was not specially wanted Instead of removing it from the tincture after the latter had been prepared, it seemed preferable to prevent its solution in the menstruum in the percolator For this purpose calcium and ferric hydroxides might be regarded, *a priori*, as equally suitable Moreover, either reagent would be expected to set free any alkaloids combined in the drug with cinchotannic acid, and thus possibly, aid in their solution

DETANNATION WITH CALCIUM HYDROXIDE

I Enough CaO was used to yield 100 Gm of $Ca(OH)_2$ when slaked with the theoretical amount of water The slaked lime was mixed intimately with 100 Gm of powdered cinchona bark, the mixture moistened with 150 cc of alcohol and packed into a cylindrical percolator Sufficient alcohol was added from time to time to yield 500 cc of tincture However, the percolate was collected in five fractions of 100 cc each These fractions were examined separately as was also a sixth fraction of 100 cc , *i e* , 100 cc more than the formula for the preparation calls for In the following table there will be found recorded the following data

A The length of time required for the percolation of each fraction
B The density of the percolate determined at 20° by means of a pycnometer
C The percentage of alcohol (by volume) ascertained by the U S P X method
D The amount of extractive determined by the U S P X method
E The alkaloidal content determined by the U S P X assay method (U S P X page 452)

	I	II	III	IV	V	VI
A	10 hrs	13 hrs	15⅔ hrs	16 hrs	15½ hrs	15 hrs
B	0 8359	0 8257	0 8280	0 8248	0 8195	0 8263
C	75 60%	76 80%	81 48%	81 08%	81 08%	86 96%
D	1 65%	0 77%	0 44%	0 14%	0 11%	0 15%
E	1 02%[a]	0 45%[b]	0 28%[c]	0 17%[d]	0 13%[e]	0 18%[f]

[a] The average of 2 determinations *viz* , 1 07% and 0 97%
[b] The average of 2 determinations, *viz* 0 45% and 0 45%
[c] The average of 2 determinations *viz* , 0 30% and 0 26%
[d] The average of 2 determinations *viz* , 0 15% and 0 18%
[e] The average of 2 determinations, *viz* , 0 14% and 0 11%
[f] The average of 2 determinations *viz* 0 20% and 0 16%

The dregs were further extracted to completion with the same menstruum and the following determinations made

Percentage extractive	1 96%
Percentage alkaloids	0 83%
Percentage tannin	0 11%

The resulting tincture was straw yellow in color Upon standing for several months the color assumed a reddish tint It gave no reaction with ferric chloride, hence may be assumed to have been free from tannin

A The period of percolation varied from 10 to 16 hours for each 100 cc percolate

B With minor irregularities the density of the five percolates constituting the tincture decreased with the extraction In this respect the fractional percolates differ from those in which the bark was not mixed with calcium hydroxide (10) It may therefore be that, in the regular percolation the cinchotannic acid is changed, in part at least, to an intermediate soluble product between it and the insoluble cinchona red which, on account of its greater density, causes a rise in density in the intermediate fractions

C Inasmuch as the alcohol used was 95 per cent by volume (not the official menstruum), it becomes apparent that the moisture of the air-dried drug was taken up, for the most part it would appear by the strong alcohol reducing its ethanol content by about 20 per cent From the table it also becomes apparent that the ethanol content of the percolate increased to about 81 per cent where it seemed to remain stationary so far as the official amount of percolate is concerned But even the final percolate to approximate exhaustion, contained about 8 per cent less ethanol than the menstruum employed It might be worth while to repeat the experiment in a dry atmosphere in order to ascertain whether the water taken up by the alcohol came from the mixture in the percolator (drug + $Ca[OH]_2$) or from the air

D The total extractive of the 500 cc of tincture contained but 3 11 per cent of extractive whereas percolate VI contained 0 15 per cent, making a total of 3 26 per cent (to this should be added the 1 96 per cent of the "exhaustive" extraction making a total of 5 22 per cent) as compared with 20 27 per cent for the drug not treated with calcium hydroxide Whereas the percentage of extractive decreases with each succeeding fraction of percolate, the percentages of extraction and the corresponding densities do not appear comparable Thus for percolates II and III the corresponding figures are

Density	0 8257	0 8280
Extractive	0 77%	0 44%

Although the density has increased slightly, the percentage of extractive has dropped materially Again we observe some of the irregularities recorded in connection with the percolation of cinchona by itself with alcohol (11)

E The alkaloidal content of the 500 cc of tincture is only 2 05 per cent, percolate VI, supposed to represent more complete extraction, contained but 0 18 per cent making a total of 2 23 per cent (Again there should be added 0 83 per cent making a total of 3 06 per cent) The crude drug had assayed 4 42 per cent These figures indicate a loss of more than 1 per cent (It has been assumed that in the deposition of cinchona red from the tannin—containing tincture, alkaloid is occluded by the cinchona red formed It may be possible that a like occlusion takes place in the percolators) Roughly speaking the second fraction of percolate contained somewhat less than one-half as much alkaloid as the first fraction the third fraction somewhat more than half as much as the second, the fourth somewhat more than one half as much as the third The fifth fraction contained not much less than the fourth, thus seeming to indicate that the last traces of alkaloid (12) still present were becoming more difficult to extract

The $Ca(OH)_2$ must effect the solubility of substances other than the 4 + per cent of tannins, such as quinic acid, etc

II As in Experiment I, 100 Gm of cinchona bark were mixed intimately with 100 Gm of $Ca(OH)_2$ and the mixture percolated with 95 per cent alcohol until 500 cc of tincture had been obtained The product was of a light straw color which darkened but little upon standing A slight whitish precipitate, presumably $CaCO_3$, resulted upon exposure to air By way of comparison the corresponding

U S P X tincture (however, 95 per cent alcohol was used) was prepared, also a third preparation using 67 5 per cent alcohol, which corresponds approximately to the menstruum of the U S P X In the last experiment the powdered cinchona bark was mixed with calcium hydroxide before it was packed in the percolator

Some of the properties of these three tinctures are herewith tabulated

		1 Tinct Prepared with 95% Alc and Lime	2 U S P Tinct	3 Tinct. Prepared with 67 5% Alc and Lime
A	Time of percolation	79½ hrs	85¾ hrs	88½ hrs
B	Sp gr 20°	0 8127	0 9302	0 9093
C	Percentage alcohol (vol)	86 46%	68 30%	55 42%
D	Percentage of extractive	0 78% (13)	7 93%	2 10%
E	Percentage of alkaloid	0 44% (14)	1 19% (15)	0 925% (16)
F	Action upon litmus	Alkaline	Alkaline	Alkaline (17)
G	Test with $FeCl_3$	Negative	Positive	Negative

A Whereas the periods of percolation varied as much as almost 10 hours it may be that this difference in time had no appreciable effect on the constants determined

B That the densities of 2 and 3, in the preparation of which a diluted alcohol had been employed, should be higher than that of 1 was to be expected The density of 1, however, is lower than that of the corresponding tincture reported under Experiment I

C The ethanol content of tincture 1 is appreciably higher than that of the tincture reported under Experiment I The ethanol content of tincture 2 is slightly higher than that of the menstruum employed, whereas that of tincture 3 is appreciably lower It would appear, therefore, that even 67 5 per cent alcohol exerts a dehydrating effect on $Ca(OH)_2$

Preparation of Quinic Acid —Approximately 500 Gm of the lime-treated dregs were extracted in a percolator with water until exhausted The water extract was evaporated to dryness, the residue boiled with 95 per cent alcohol, and filtered The alcohol removed material, which was of an amorphous character The residue, insoluble in alcohol, was dissolved in warm water, decomposed with oxalic acid, the calcium oxalate filtered off and the quinic acid crystallized

Fate of Tannic Acid in Drug —Lime apparently removes the tannins from cinchona in the form of calcium tannate Tannin determinations made on the dregs by means of the hide powder method, revealed little tannin These determinations were made by first treating the bark with HCl so as to free the tannin

Qualitative tests for tannins were made with ferric chloride and gelatin solution after first treating the bark with acid as stated above No tests for tannins were apparent The solutions were then carefully neutralized with ammonia and the tests with ferric chloride and gelatin repeated with the same results

Further attempts were made to learn of the function of the lime in the detannation of the cinchona bark After treating the dregs with HCl and filtering the aqueous solution, it was refluxed for 4 hours For comparison a decoction of cinchona bark was filtered, the same quantity of HCl added and refluxed in the same manner In the case of the bark, cinchona red was obtained and identified by precipitation as the barium compound, but in the case of the detannated dregs no cinchona red was obtained The experiment in the latter case was repeated without treating the dregs with HCl and the same results were obtained

PREPARATION OF TINCTURE OF CINCHONA U S P X, AND DETANNATED TINCTURE OF CINCHONA

III A liter of each of the tinctures was prepared from red cinchona bark (18) which assayed 6 37 per cent and 6 82 per cent (19), respectively, of total alkaloids (20) in as many assays by the U S P X method

The following data were determined on each tincture employing the methods as outlined in the U S P X

	U S P Tincture	Detannated Tincture (21)
Sp gr 20°	0 9125	0 8928
Extractive	32 30%	2 03%
Alkaloids	1 15% (22)	1 01% (23)
Test with $FeCl_3$	Tannins present	No tannins present

PHYSICS IN PHARMACY

PART V, A STRIP OF FILTER PAPER OR CAPILLARY HYDROSTATICS, CAPILLARY DIFFUSION AND CAPILLARY OSMOSIS * [1]

BY JOHN URI LLOYD, WOLFGANG OSTWALD AND HANS ERBRING

I PRESENTATION AND THEORY

1 Basic Experiment—About 35 years ago, the senior author, in a publication not easily accessible to physico-chemical investigators,[2] described the following experiment

Connect two glass tubes closed below, one being filled with a salt solution, the other with water, by means of a strip of filter paper, and bring the meniscuses in

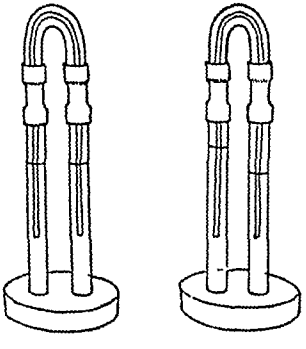

Fig 1*a* Fig 1*b*

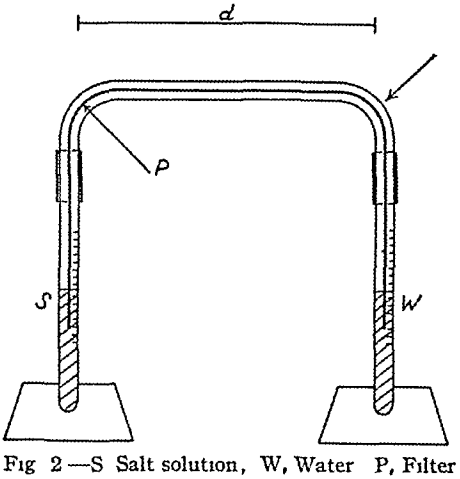

Fig 2—S Salt solution, W, Water P, Filter paper

both tubes to the same level by raising or lowering the tubes (see *Fig 1a*, original figure) Protect the system from evaporation by means of a connecting tube bent in U shape and two short pieces of rubber tubing

After a few hours, more plainly after a few days, it is found that a motion of the liquid has taken place The liquid column in the tube with the salt solution has increased, that in the tube containing water has diminished Hence, water has passed through the strip of filter paper into the salt solution (see *Fig 1b*, original figure)

The experiment looks very simple, its explanation, however, is not correspondingly simple We shall see in the following study that in this apparently "spontaneous" transport of liquid, quite a series of physico-chemical principles is involved which should be of interest to the thoughtful pharmacist In the following pages, we have taken up the problem of determining the nature of these forces in order to find an explanation of this effect

---

* Translated from the German by Dr Sigmund Waldbott

[1] Scientific Section, A PH A, Toronto meeting, 1932

[2] John Uri Lloyd, Etidorpha The Robert Clarke Company, 1897, page 138

It is evident that if this phenomenon can be seen to rest on a safe experimental and possibly also theoretical basis, it will be of interest in many a question of physical and colloid chemistry The senior author himself (*loc cit*) has pointed out that such movements of liquids would affect geological and hydrological questions, *e g*, as to the origin of salt lakes and subterranean water courses, thereby assuming that porous materials like sand, sandstone, etc, act in the same manner as filter paper Then the theories of 'swelling" suggest themselves Concerning this, different authors, *e g*, Proctor and Wilson, J Duclaux, D Jordan Lloyd, J Loeb, Northrop and Kunitz, etc, have recently considered "osmotic" forces in the movement of water in the swelling of gels although the existence of "cell structure" or semipermeable membrane ' in swelling gels has not always been proved, nor is it even always considered probable

In filter paper, also, we have movement of water without cell- or (honey) comb structure, and without membranes Such movements of liquids "without membranes" might be of importance also in the physiological problems of movements of water in the organism

2 Method of Operation—The following method was used in these experiments Two glass tubes, closed at one end, each 10 cm long and of 0 5-cm diameter, and provided with a millimeter scale, were filled to about $^3/_4$ with the solutions to be examined, and placed upon a suitable support Through a U-shaped glass tube, also of 0 5 cm diameter, a thin strip of filter paper, 2–3 mm wide, was drawn, both ends of the paper projecting from the tube The two strips of paper were introduced into the two liquid cylinders, immersed to a definite distance in the liquids, and two short pieces of rubber attached to the ends of the U tube were drawn over the edge of the cylinders The pieces of rubber were covered with a layer of paraffin or "pizein," which protected the system quite well from loss by evaporation

The resulting arrangement is represented in *Fig 2* In all experiments, the paper was immersed in the liquid to a depth of 3 cm The filter paper was used, either dry or moistened with the solutions employed For an account of the differences noted, see *Section 5* Also, different grades of filter paper have been used, see *Section 6* At the beginning of the experiment, the meniscuses must be exactly at the same height in both cylinders, this is easily attained by vertical change of position of the cylinders

It is furthermore important that the connecting piece *d* shall always be in an exactly horizontal position

The changes in the position of the meniscuses were read at both scales by means of the lens The experiments were carried out at ordinary room temperature, since it was found that the use of thermostats was superfluous as the temperature factor proved to be very insignificant Cf *Section 10*

3 Repeating the Basic Experiment—The following is an example taken at random from the many experiments which we conducted according to the above method, in order to demonstrate that the basic experiment is reproducible, and at the same time to characterize the Effect quantitatively

Table I shows an experiment with saturated *ferric chloride* solution The length of the horizontal connecting piece was 9 cm (see *d* in Fig 2) In this experiment the filter paper was used *dry* Upon connecting the two liquids by the filter paper, there is at first capillary rise in

both tubes, in this case, salt solution and water meet on the side of the salt solution It was only after this capillary connection was completed that the leveling of both liquid surfaces was done

TABLE I

System $FeCl_3$ (saturated) *vs* Water $d = 9$ cm

1	2	3	4	5	6	7
Duration of Exp Hours	Height in Cyl S Cm	$FeCl_3$ Increase in Cyl S Mm	Height in Cyl w Cm	H_2O Decrease in Cyl w Mm	Total Difference Mm	Liquid Taken Up by Paper Col 5 Minus Col 3 Mm
0	5 00	0 0	5 00	0 0	0 0	0 0
16	5 1	1 0	4 65	3 5	4 5	2 5
42	5 15	1 5	4 5	5 0	6 5	3 5
62	5 22	2 2	4 35	6 5	8 7	4 3
80	5 25	2 5	4 33	6 7	9 2	4 2
100	5 3	3 0	4 25	7 5	10 5	4 5
Days						
8	5 35	3 5	4 15	8 5	12 0	5 0
11	5 35	3 5	4 15	8 5	12 0	5 0
14	5 35	3 5	4 15	8 5	12 0	5 0
16	5 35	3 5	4 2	8 0	11 5	4 5
20	5 3	3 0	4 25	7 5	10 5	4 5
25	5 28	2 8	4 3	7 0	9 8	4 2
40	5 2	2 0	4 35	6 5	8 5	4 5

The headings of the 7 columns in Table I are self explanatory, the results, also represented graphically, in Figs 3 and 4, furnish a quantitative characterization of the effect

From *Table I* and the *diagrams*, the following results are noteworthy

1 The principal effect takes place within about the first 8 days

2 Upon longer duration of the experiment, the effect again decreases, the movement of the liquid becomes retrograde however, the descent takes place more slowly than the rise

3 The decrease in the cylinder containing water runs somewhat parallel to the increase in the salt solution, but is of much higher absolute value than the latter

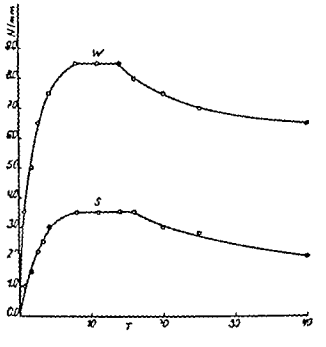

Fig 3 —N, Difference of level in mm , T Time in days Curve W shows decrease in the water cylinder, Curve S shows increase in the salt cylinder

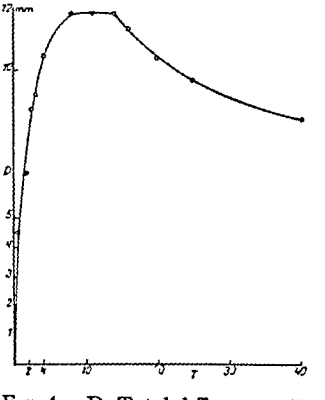

Fig 4 —D, Total difference, T Time in days

A considerable quantity of the liquid "disappears" in the experiment, this is especially noticeable in *Fig 3* The "vanished" liquid is contained partly in the capillary spaces of the paper and contributes in part to the swelling of the filter

paper, another part is condensed in the form of droplets along the glass walls, especially that of the U tube

The general course of the Effect may be well visualized by the aid of *Fig 5*, in which the height of the liquid columns attained in the time periods I, II, III and IV are brought out by hatched lines

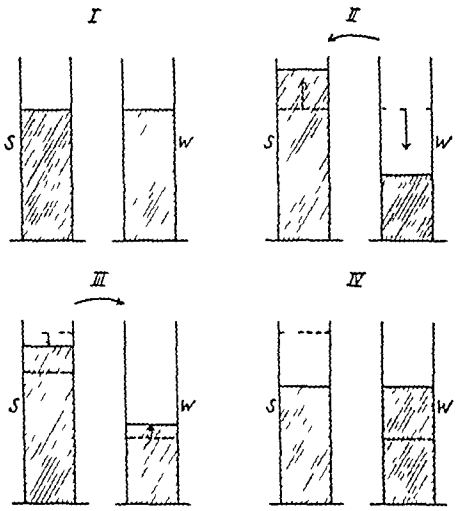

Fig 5

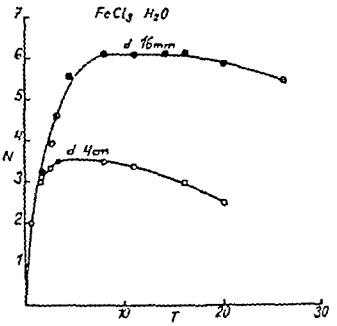

Fig 6 —N, Increase of level in mm , T Time in days

As one might be inclined to regard the numerical value of the Effect, in this case a maximum difference of 12 mm as insignificant, we present herewith in *Table II* an example to show how large an effect may be attained under certain conditions By merely leaving $FeCl_3$ in contact with undissolved $FeCl_3$ at the bottom of cylinder S, and conducting the experiment as before, there will be, during the same period of time, differences of level of at least 28 3 mm , the maximum not yet being reached

TABLE II

System $FeCl_3$ plus undissolved $FeCl_3$ at the bottom, *vs* Water d = 12 cm Paper wetted at start

4	10 5	15 5	26 0
8	11 5	15 5	27 0
15	12 5	15 8	28 3

II FURTHER EXPERIMENTAL DETAILS

Before passing on to the theory of the phenomenon, we wish to give from our large and varied experimental material a few experimental details in order that the effect herein considered may be viewed from other angles

4 Influence of Length of the Capillary Connecting Piece—In the foregoing discussion, the capillary connecting piece, *i e*, the strip of filter paper, is of essential importance It therefore became of interest to know in what manner the dimensions, particularly the length (*d*) influences the Effect Summing up, we find a distinct *increase of the Effect with increase of length, provided,* however, that the *paper is previously moistened with the solution* Experimental details for this are given in the following *Tables III, IV, V, VI,* and *Figs 6* and *7,* salt solutions used against water were saturated *Ferric Chloride* and saturated *Barium Chloride* solutions

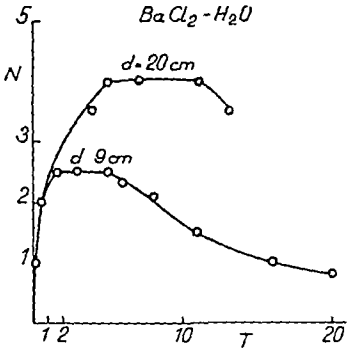

Fig 7—N Increase of level in mm, T Time in days

4	3 5	4 0	7 5
5	4 0	5 0	9 0
7	4 0	6 0	10 0
11	4 0	6 0	10 0
13	3 5	6 0	9 5

With $FeCl_3$ (*Tables III* and *IV*), we see that the fourfold length of the capillary connecting piece results in practically doubling the Effect (increase of level in cylinder S) Relatively still more pronounced is the Effect with $BaCl_2$ (*Tables V* and *VI*), where tubes with d = 9 cm and 20 cm are used

In both cases, we also note a faster decline from the maximum in the shorter connecting tube Experiments with still longer tubes have shown that the errors caused by the large quantities of the liquid retained by the paper and by condensation of liquid become so great as to render results inexact, hence longer connecting tubes cannot be recommended

5 *Influence of Preliminary Wetting* —In starting the experiment, we may allow both liquids to rise and meet in the dry paper, or we may first moisten the paper with the salt solution, then continue with the experiment Moistening with water would practically have the same effect as the use of dry paper, since water

as a rule rises very much faster than the solution, in this case, both liquids would meet in cylinder S

We found the Effect to be notably stronger and better reproducible if the solution is allowed to migrate into the filter paper, as high as into the beginning of the descending branch of the connecting tube on the water side (see arrow in *Fig 2*) Waiving numerical data for this experiment, we show in *Fig 8* the graphic results of such a parallel experiment with wet and with dry filter paper

6 Influence of the Quality of Paper —Filter papers are usually characterized by their transversal permeability, *i e*, according to the average diameter of their pores A paper with very small-sized pores is, *e g*, that of Schleicher and Schull No 602 (hard), the size of pores is about 2 2μ [1] Again, filter papers may be characterized by their "imbibing ability," *i e*, by the speed of capillary rise of water in them This is a longitudinal property of the paper, caused by an especially numerous aggregation of narrow capillaries Such a paper is that of Schleicher and Schull No 604 (soft), it has considerably larger transversal pores than the hard paper No 602 The paper used in the preceding experiments was intermediate between these two extremes

TABLE VII —INFLUENCE OF QUALITY OF PAPER PAPER WETTED AT START

System $FeCl_3$ (saturated) *vs* Water d = 12 cm

Weeks				
8	1 5	7 5	9 0	6 0

Table VII and *Fig 9* show considerable difference existing in the activity of the soft, felt-like paper, compared with that of the hard and dense paper No 602 The Effect is of much greater magnitude with the former than with the latter With No 604, the maximal increases of level are more than twice as much as with

[1] Cf Wo Ostwald Kleines Praktikum der Kolloidchemie " 7th Edition page 26 (Steinkopff, Dresden)

No 602 The kinetics of rise are likewise different, with No 604, the rise takes place far much faster than with No 602

There is also a notable and plausible difference in the quantities of liquid retained in the filter paper, cf the last column in *Table VII*

7 Clogging of the Capillaries by Formation of a Precipitate —In a systematic study on the relation of size of pores in unglazed porcelain and osmotic activity by *L Bigelow* and *F E Bartell* (see later), Bartell found, for example, that porcelain

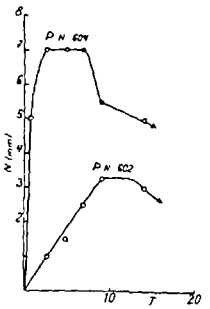

Fig 9 —N, Increase of level in mm T Time in days, P, Filter paper

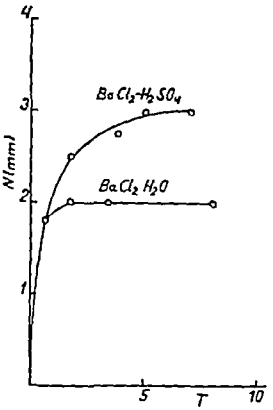

Fig 10 —N, Increase of level in mm , T, Time in days

with pores smaller than 0 4μ is of direct use as an osmotic cell He also diminished the width of the pores by precipitating $BaSO_4$, S, $PbCrO_4$, CuS, etc , within the capillaries of the pores, this likewise caused an increase of the capillary effect

Although a piece of filter paper longitudinally soaked with liquid is evidently different from a transversally soaked wall of a porcelain cell, we may believe that in both cases a narrowing of the capillaries, resp , the pores will act in the same direction Accordingly we have also tried to diminish the width of the fibrillary capillary spaces by depositing within them finely divided precipitates

TABLE VIII

System A $BaCl_2$ (saturated) *vs* Water d = 4 cm Paper dry at the start

Duration Hours	$BaCl_2$—Increase Mm	H_2O—Decrease Mm	Total Difference Mm
16	1 8	2 5	4 3
42	2 0	3 5	5 5
62	2 0	4 0	6 0
80	2 0	4 5	6 5
Days			
8	2 0	5 0	7 0

Now Clogging the Capillaries by Precipitation

System B BaCl (saturated), *vs* 0 1*N* HSO_4 d = 4 cm

Hours	Mm	Mm	Mm
16	1 8	2 8	4 6
42	2 5	3 5	6 0
90	2 5	4 5	7 0

Days			
5	3 0	5 0	8 0
7	3 0	5 2	8 2

In *Table VIII* and *Fig 10* are shown the results of an experiment (*System B*), in which the capillary spaces are diminished in size by precipitation of $BaSO_4$ within them, water placed against the saturated $BaCl_2$ solution in *System A* is substituted by tenth-normal sulphuric acid

The narrowing of the capillary tubes is seen to result in the increase of our Effect

8 Experiments with Other Substances —The experiments described thus far were carried out with $FeCl_3$ and $BaCl_2$ *vs* water Without presenting numerical values, we see from *Figs 11* and *12* that the effect is obtained also with *KCl* (univalence) and with $AlCl_3$ (trivalence), and with non-electrolytes such as *Cane sugar*

Experiments we carried out with *Urea* will be described in *Section 10* [1]

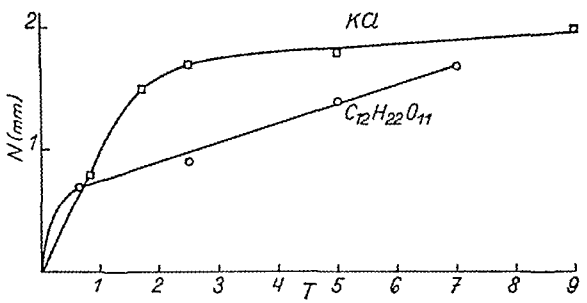

Fig 11 —N Increase of level in mm T, Time in days Paper dry at start

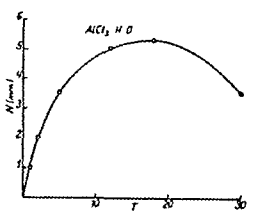

Fig 12 —N, Increase of level in mm , T, Time in days, Paper wet at start

It might appear strange that cane sugar gives but a relatively small Effect as compared with that of the salts However, when comparing the curves in *Fig 11*, we see that only the *beginning* of the curve of the sugar has been measured, while the KCl curve, after about 8 days, runs practically horizontal, the curve for the sugar, during the same time, shows a decided, almost linear rise The thought suggests itself to hold the high molecular weight of the sugar, and the high viscosity of its solutions responsible for the smaller velocity displayed in producing the Effect In addition, this experiment with cane sugar was conducted at the time when the importance of preliminary wetting had not yet been recognized

9 Quantities of Liquids Retained by the Filter Paper —In the first part of this paper, attention was called to the relatively large quantities of liquid held by the filter paper These quantities vary, not only according to the kind of filter paper used (cf *Section 6*), but also according to the nature of the solution

(*End of First Instalment*)

[1] Alcohols used in the experimental apparatus herein described showed *peculiar movements* concerning which we shall report in a later communication

THE REPUTED INFLUENCE OF ULTRAVIOLET LIGHT ON THE YIELD OF DIGITALIS GLUCOSIDES *

BY C S LEONARD AND JOHN M ARTHUR

It has been claimed that the yield of active drug substances in certain drug plants can be altered by differences in the quality of the light under which they are grown Thus, McCrea (1) has claimed that if seedlings of *Digitalis purpurea* are sprouted and grown for a time under a glass having a high ultraviolet transmission, then set into the field, dried powdered leaf made from these seedlings will yield more cardiac glucosides, as tested by bioassay than will that from similar plants sprouted under window glass and set out into the field

In examining this work it appeared to the writers that a number of factors were not controlled in Miss McCrea's experiments and that some of these factors could be kept constant during the experimental period with the facilities available at the Boyce-Thompson Institute The experiments here reported have been in progress for three years Two strains of seed of *Digitalis purpurea* were obtained, one from Professor Edward Kremers of the University of Wisconsin and grown at the Pharmaceutical Experiment Station there, the other was obtained from a local seedman of the New York district (called Vaughan's strain) Both species were germinated and grown under the standard conditions possible in two air-conditioned greenhouses of the Boyce-Thompson Institute, but one group of each was under "Sunlit" glass with which one greenhouse is glazed, the other under ordinary window glass The "Sunlit" glass used varied in thickness from 2 5 to 3 mm Coblentz and Stair (2) found an average transmission for "Sunlit" glass at wave-length 302 mμ of 65% when new and 39% after solarization by exposure to a mercury vapor

* Contribution from the Burroughs Wellcome and Company Experimental Research Laboratories Tuckahoe N Y and from the Boyce-Thompson Institute for Plant Research Inc , Yonkers, N Y

arc The average thickness of the samples tested was 2 3 mm Similarly, the figures determined for "Vita" glass for like wave-length and thickness were 48% and 22%, respectively Coblentz and Stair have pointed out that a variation in thickness of 0 1 mm produced a change in transmission of 1 2% at a wave-length of 302 mμ The limit of transmission of the window glass is 313 mμ No difference of morphology of the plants (size, etc) has been seen

I EXPERIMENTS IN WHICH THE PLANTS WERE KEPT FOR THREE TO FOUR MONTHS AFTER GERMINATION IN THE EXPERIMENTAL GREENHOUSES AND WERE NOT SET INTO THE OPEN

One strain was started July 29, 1930 (Vaughan's), the other in September (Wisconsin), hence the two sets of plants were not of identical age at the time of sampling On January 12, 1931, six sturdy plants were selected at random from each group for each powder, two powders being made from each group All but one were dried under the same conditions in the attic of the Boyce-Thompson Institute One was dried in an electric oven at about 45° C Eight powders and tinctures were made by the U S P method [1] A table below gives the results

TABLE I —REPORT OF ASSAY BY THE U S P ONE-HOUR FROG METHOD OF TINCTURES MADE FROM DIGITALIS LEAF FROM PLANTS 4–6 MONTHS IN THE GREENHOUSE

Tincture Number	Per Cent U S P	Total Solids Gm per 100 cc	Variety	Greenhouse	Age Months
1	126 ± 10*	4 06	Wisconsin	Window glass	4
2	120 ± 10*	4 11	Wisconsin	Window glass	4
3	200 ± 10*	3 26	Vaughan	Window glass	6
4	150 ± 10*	3 17	Vaughan	Window glass	6
5	109 ± 10*	3 75	Wisconsin	'Sunlit' glass	4
6	150 ± 10*	3 78	Wisconsin	"Sunlit" glass	4
7	150 ± 10*	3 08	Vaughan	'Sunlit" glass	6
8	133 ± 10*	3 20	Vaughan	"Sunlit" glass	6

* Probable error in U S P bioassay (A O A C)

Comments on Table I —Three Wisconsin samples were low in bioassay, one high Three Vaughan samples were high in bioassay, one low The average for the Vaughan samples is higher than the Wisconsin samples but the plants are several months older so this is to be expected The average bioassay for the samples from both sources grown under window glass (149%) is higher than that for those grown under the 'Sunlit" glass (135%) Hence, any conclusion from this would be that the extreme ultraviolet region is detrimental to the yield of alkaloids However as the error of bioassay is ±10%, and there is an additional slight error due to possible variations of extraction and to the individual variations, which despite the presence of six plants in each powder were likely to be evident, we believe that the difference seen, namely 14% U S P, is within the possible error of the experiment

II EXPERIMENTS IN WHICH THE PLANTS WERE GROWN 4 MONTHS IN THE GREENHOUSES AND SET OUT INTO THE FIELD FOR 5 MONTHS

The Wisconsin strain only was used The seed was planted in January These plants were kept in the greenhouses under the same conditions as in the first experiment On removal to the open field a part were put into a plot of ground at the Boyce-Thompson Institute, a part at another plot located at the U S A

[1] Type Process P of the U S P X without the modification for the adjustment to U S P strength of assayed tinctures, but rather making directly to 1000 cc

Works of Burroughs Wellcome & Co , Inc , both in Yonkers, N Y A set of six sturdy plants was taken from each field and each group (previously under ordinary glass and previously under "Sunlit" glass) They were dried by spreading on a paper in an attic as before Four powders and tinctures were made by the U S P method and assayed by the U S P one-hour frog method The results are given in Table II

TABLE II

Tincture Number	Per Cent U S P	Total Solids Gm per 100 cc	Field	Greenhouse	Age Months
9	140 ± 10	2 20	B W & Co	Window glass	9
10	84	2 34	B W & Co	Sunlit glass	9
11	84	2 70	Boyce-Thompson	Window glass	9
12	70	2 24	Boyce Thompson	'Sunlit" glass	9

Comments on Table II —The results tend to be lower than in the previous test, apparently because of the time of sampling Those specimens originally under window glass were up to 70% U S P higher in potency by bioassay than specimens otherwise of similar history, but originally under Sunlit glass In different fields the variation in specimens of identical history is evident This variation is from 14% to 56% U S P The evidence thus afforded that the glucoside yield varies enormously with soil conditions seems significant

III EXPERIMENTS IN WHICH THE PLANTS WERE GROWN 9 MONTHS IN THE GREENHOUSE AND NOT SET INTO THE FIELD

A portion of the seedlings of Experiment II were not set out into the field but were continued for the nine months in the air-conditioned greenhouses Two sets of 6 sturdy plants were taken from each group They were dried as before Four powders and tinctures were made by the U S P method and assayed by the U S P one-hour frog method The results are given in Table III

TABLE III

Tincture Number	Per Cent U S P	Total Solids Gm per 100 cc	Greenhouse	Age Months
13	60 ± 10	3 40	Window glass	9
14	84	3 34	Window glass	9
15	112	3 22	'Sunlit" glass	9
16	76	2 96	"Sunlit" glass	9

Comments on Table III —The specimens grown throughout in the greenhouse also show considerable variability although here set in the same soil and kept under the same conditions as regards all factors but light The difference in the same greenhouse of two specimens is 36% U S P in the case of the specimens under 'Sunlit" glass and 24% in the case of the ordinary glass The average of the former is 94%, the average of the latter is 72% Thus, here the specimens under "Sunlit" glass are higher in glucoside yield by 22% U S P if the averages are compared but the differences between specimens of identical history is greater (24–36% U S P) and if the 84% specimen from the greenhouse with ordinary glass were compared with the 76% specimen from the house with "Sunlit" glass, the former would appear to have the advantage

IV EXPERIMENTS IN WHICH THE PLANTS WERE GROWN IN THE GREENHOUSES FOR 8 MONTHS, SET INTO THE FIELD OVER THE WINTER AND HARVESTED JUST BEFORE FLOWERING TIME

As the plants grown in the previous experiments had no cold dormant period, they failed to send up flower stalks and flower The objection might be raised that

these plants were abnormal because they did not flower The time specified in the pharmacopœias for harvest of digitalis is just before the flowering time Seedlings of the Wisconsin strain were grown therefore in the greenhouse for 8 months They were germinated in January, repotted once and set out in October into two fields, one at the Boyce-Thompson Institute experimental ground and the other at the Works of Burroughs Wellcome and Company After the usual winter dormant period of these perennials, many plants produced abundant and vigorous foliage the following spring and sent up the usual flower stalk in May They were harvested May 27th, over 17 months after germination and after 8 months of life in the greenhouses and 9 months in the field Six specimens were collected, 2 sets of 6 sturdy plants from the Boyce-Thompson plants of each group and one set from each group grown at the Burroughs Wellcome field The results are given in Table IV

TABLE IV

Tincture Number	Per Cent U S P	Total Solids Gm per 100 cc	Field	Greenhouse
17	104 ± 10	2 20	Boyce-Thompson	Window glass
18	74	2 27	Boyce-Thompson	"Sunlit" glass
19	61	2 20	Boyce-Thompson	Window glass
20	95	2 36	Boyce Thompson	"Sunlit" glass
21	87	2 43	B W & Co	Window glass
22	77	2 44	B W & Co	'Sunlit" glass

A specimen from plants similarly treated except grown under window glass of unknown light transmitting power gave a potency of 114% U S P

Comment on Table IV—It is evident from comparing this group to Group I that the yield of active glucosides is greater in dried powdered leaf from young plants, 6 months of age than from older plants whether these are about to flower or not The young plants display average yields nearly double that of the older This agrees with the observation of Miss McCrea (3) For the plants of pharmacopœial standard age (flowering time) the average of the specimens under window glass is 84% that of the specimens under 'Sunlit" glass is 82% The difference is negligible, far within the error of the experiment

DISCUSSION

Finally, we may average and compare all the results of each type obtained in the four experiments on the total of 22 specimen tinctures made from the specimens, 11 with a history at least as seedlings of growth with no ultraviolet light, 11 supplied with ultraviolet light The specimens under window glass average 110 4%, the specimens under "Sunlit" glass average 102% This difference is about 8% U S P and is well within the error of bioassay and hence it is not believed that the difference is significant, particularly in view of the wider variations which are to be seen in specimens of identical history For example, specimens 17 and 19 are two lots of the same sort of specimens They show 33% U S P difference Numbers 15 and 16 similarly are comparable and show 36% U S P difference Only in the experiments of Group III were the specimens under "Sunlit" glass higher than the specimens under window glass and then less than the above 36% No consistent, significant differences were found in yield of glucosides as were found by McCrea The above experiments demonstrate the great variation in glucoside yield which can be seen in sets of plants of identical prior history set into different fields or even from different regions of the same field Even when

grown in pots, with a presumably uniform soil and kept under controlled and constant greenhouse conditions, two lots of 6 plants each, both under "Sunlit" glass, show as much as 36% U S P variation The averages obtained in the experiments here reported do not permit any assumption that the influence of the extreme ultraviolet region of sunlight, either during the seedling stage or throughout the life of the plant, affects the yield of active glucosides

SUMMARY

No significant differences in glucoside yield could be observed between digitalis plants grown under a glass having a higher ultraviolet transmission and those grown under ordinary window glass, whether the plants were kept until sampled in the air conditioned greenhouses or were set out after some months of such treatment into the open field

Digitalis plants were found to require a cold dormant period in order to induce flower stalk formation Miller (4) and Thompson (5) have reported a similar cold period requirement for the flowering of two other biennials, celery and cabbage

Dried powdered leaf from young plants 4 to 6 months old has nearly double the glucoside content of that from older plants (9–17 months old) whether a flower stalk is formed on the older plants or not

The authors desire to thank Dr S H Culter and Mr R W Henderson for preparing the U S P tinctures, and Dr Merl E Fisk and Dr Marvin R Thompson for the assay results herein reported

STUDY OF GERMICIDAL AND ANTISEPTIC ACTIVITIES OF SOME DERIVATIVES OF 8-HYDROXY QUINOLINE *

BY E MONESS AND W G CHRISTIANSEN

8-Hydroxy quinoline has bacteriostatic properties and is generally used in the form of its sulphate, which is water soluble Matzumura (1) prepared 5-8-dihydroxy quinoline, and the presence of the additional hydroxyl suggested the possibility that such a compound may be soluble in an aqueous medium without resorting to salt formation

This compound was prepared, as well as two chlorinated derivatives of it, and all were found to be soluble in a vehicle containing 30 parts of alcohol, 40 parts of

* Section on Practical Pharmacy and Dispensing, Madison meeting 1933

glycerin and 30 parts of water Such a solution was found to be miscible with water in all proportions In the germicidal and bacteriostatic tests 0 25% solutions of these compounds in alcohol-glycerin-water were used and diluted with suitable amounts of water at the time of test

Chlorination of 5-8-dihydroxy quinoline always yielded a mixture of the mono-chlor and di-chlor compounds Recrystallization from alcohol separated the mixture into two fractions one was largely 7-chlor, 5-8-dihydroxy quinoline admixed with some non-chlorinated 5-8-dihydroxy quinoline, while the other was largely 6-7-dichlor, 5-8-dihydroxy quinoline, admixed with some of the mono-chlor derivative

The germicidal and bacteriostatic activity of these compounds was found to be only moderate as seen from the following table

Solution	Dilution at Which Compound Kills				Dilution at Which Compound Is Bacteriostatic.	
	Typhoid		Staphylococcus		Typhoid	Staphylococcus
	5 Min	10 Min	5 Min	10 Min	24 Hours	24 Hours
5 8 dihydroxy quinoline	< 1–400	1–400	< 1–400	< 1–400	1–10,000	1–10 000
84 2% mono-chlor compound + 15 8% non-chlorinated dihydroxy quinoline	1–400	1–400	1–400	1–400	1–10,000	1–20 000
72 6% dichlor compound + 27 4% mono-chlor derivative	1–400	1–400	1–400	1–400	1–10 000	1–20,000

All the solutions are unstable due to the fact that the compounds oxidize easily, this is characteristic of compounds in which two hydroxyl groups are para- or ortho- to each other Due to this oxidation the solutions darken with time from an original yellow-brown color to a dark red, and deposit a slight dark sediment

According to Klarmann (2) the mono-ethers of hydroquinone exhibit germicidal power far greater than that of the original substance It was thought that by preparing mono-ethers of 5-8-dihydroxy quinoline a similar increase in germicidal activity could be obtained, coupled with the additional advantage that such compounds would not be subject to oxidation and would give stable solutions With this object in view, two compounds were prepared—the mono-ethyl and butyl ethers of 5-8-dihydroxy quinoline

At first an attempt was made to fix the position of the alkoxy group by starting with 8-ethoxy quinoline, which was nitrated to 5-nitro-8-ethoxy quinoline and reduced to the amino derivative This compound could be diazotized without any difficulty, but the attempt to replace the diazonium group by hydroxyl was unsuccessful, the yield was insignificant, and the reaction yielded complicated tarry and resinous compounds Consequently the method of Klarmann was used, and the mono-ethers were prepared by the direct alkylation of 5 8-dihydroxy quinoline, the mono ethers were separated from the di-alkylated derivatives by treatment

with alkali When this method is used the exact position of the alkoxy group cannot be stated—it may be either in the 5- or 8-position

When solutions of these compounds were made up in a vehicle consisting of a mixture of 30 parts of alcohol, 40 parts of glycerin and 30 parts of water, it was found that unlike the solutions of 5-8-dihydroxy quinoline, they were not miscible with water in all proportions Thus a 1–400 solution of the mono-ethyl ether would become turbid on the addition of one volume of water, and would deposit crystalline material when two more volumes of water were added A 1–400 solution of the mono-butyl ether deposited some crystalline material on being diluted with only one volume of water However, both compounds formed water-soluble salts with great ease the addition of one equivalent of tartaric acid to the alcohol-water-glycerin solutions to the ethoxy and butoxy compounds made it possible to dilute these solutions with water without having precipitation occur The ethoxy compounds dissolve in aqueous tartaric acid, sufficient material was not available to enable us to make a similar test with the butoxy compound

The germicidal and bacteriostatic activities were greatly enhanced, especially the germicidal activity of the butoxy compound

Solution	Dilution at Which Compound Kills				Dilution at Which Compound Is Bacteriostatic	
	Typhoid		Staphylococcus		Typhoid	Staphylococcus
	5 Min	10 Min	5 Min	10 Min	24 Hours	24 hours
Mono ethoxy compound of 5 8 dihydroxy quinoline	1–400	1–400	1–800	1–800	1–200 000	1–400,000
Mono butoxy compound of 5 8 dihydroxy quinoline	1–2000	1–2000	1–800	1–800	None	1–200 000

It is not quite clear why the bacteriostatic test for the butoxy compound was negative for typhoid bacilli, and this will be checked in the course of work now in progress on derivatives of hydroxy quinoline

EXPERIMENTAL

5-8-Dihydroxy Quinoline—Ten Gm of 5-nitroso 8-hydroxy quinoline was dissolved in a solution of 75 cc of concentrated hydrochloric acid in 2700 cc of water The solution was kept at 95° C and 16 Gm of iron filings was added to it with constant stirring in small portions over a period of one hour The solution was then stirred for one more hour at 95° C It was filtered and evaporated to a volume of 150 cc On cooling a crystalline mud separated out, which was filtered off The dark brown crystalline substance was resuspended in 150 cc of a mixture of equal parts of concentrated hydrochloric acid and water, brought to a boil and cooled In this way 8 Gm of light brown crystals of the hydrochloride of 5-8-dihydroxy quinoline was obtained A sample dissolved in water and precipitated with sodium carbonate gives a grayish brown substance, melting point 180° C The melting point for the purified substance as given in the literature is 181–183° C

Chlorination of 5-8-Dihydroxy Quinoline

5-8-Dihydroxyquinoline	4 Gm
Glacial acetic acid	80 cc
Sulphuryl chloride	6 cc

The compound was dissolved in the acid and to the solution was added slowly and with mechanical stirring a solution of the sulphuryl chloride in a little glacial acetic acid A large excess of SO_2Cl_2 was used, since it was found that with a small excess the chlorination proceeded only partially

An orange precipitate was obtained and was filtered off, dissolved in water and neutralized with sodium bicarbonate

The filtrate was evaporated to a small volume and a second crop of orange crystals was obtained

Yield—3 8 g of a gray crystalline substance, m p —150° C

Analysis

Chlorine	Found	21 22%
	Calculated for C_9H_6O NCl	18 30%
	Calculated for $C_9H_5O_2NCl_2$	30 88%

Evidently some of the di-chlor compound was also formed By a fractional crystallization from alcohol we obtained two fractions, one analyzing as a mixture of 72 6% di-chlor and 27 4% mono-chlor compound, with a melting point of 163° C and the other as a mixture of 84 2% mono-chlor compound and 15 8% non-chlorinated 5-8-dihydroxy quinoline, with a melting point of 128° C

Both substances are easily soluble in alcohol and a solution in alcohol and glycerin is miscible with water in all proportions

Preparation of the Mono-ethyl Ether of 5-8-Dihydroxy Quinoline —4 03 Gm of 5-8-dihydroxy quinoline and 3 9 Gm ethyl iodide were dissolved in 4 cc of alcohol The solution was refluxed and a solution of 1 5 Gm KOH in 4 2 cc water was added dropwise during one hour, the refluxing was continued for 3 hours A solution of 2 Gm of KOH in a little water was then added, and on cooling the reaction mixture was extracted with ether The ether extract was washed several times with a 10% solution of KOH, these alkaline extracts were combined with the alkaline reaction mixture and precipitated with acetic acid A somewhat tarry precipitate was obtained which was purified by extracting with ether This ether extract was washed with water, purified with charcoal, dried over anhydrous sodium sulphate and the ether was evaporated off, 0 8 Gm of a yellowish crystalline substance was obtained, m p 96–98° C

Analysis Found—C, 69 7%, H, 5 37%, calculated for $C_{11}H_{11}O_2N$—C, 69 7%, H, 5 82%

Preparation of the Mono-butyl Ether of 5-8-Dihydroxy Quinoline —2 65 Gm of 5-8-dihydroxy quinoline and 2 22 Gm butyl bromide were dissolved in 2 65 cc of alcohol This solution was refluxed and a solution of 1 Gm of potassium hydroxide in 3 cc of water was added dropwise during an hour The refluxing was continued for another 3 hours The reaction mixture was worked up in the same manner as the ethoxy compound

Yield—0 7 Gm of yellowish white crystalline substance, slightly contaminated with a trace of an oily admixture, m p 92° C

Analysis Found—C, 70 60%, H, 6 50%, calculated for $C_{13}H_{15}O_2N$—C, 71 80%, 6 90%

Both the ethoxy and the butoxy derivatives of 5-8-dihydroxy quinoline form orange, water-soluble salts, such as the hydrochloride and the tartrate

The biological tests on compounds reported herein were made in the Biological Research Laboratories of E R Squibb and Sons and we gratefully acknowledge their assistance

A STUDY OF VEHICLES FOR MEDICINES *

BY BERNARD FANTUS, H A DYNIEWICZ AND J M DYNIEWICZ

V COMPOUND ELIXIR OF CHLORAL AND BROMIDE

As an "horrible example" of an undesirable N F preparation, must be mentioned the Compound Mixture of Chloral and Potassium Bromide," which in addition to 20% each of chloral and bromide has 0 2% each of extracts of cannabis and of hyoscyamus added to it The extracts are triturated with pumice and then the hot solution of the chloral and bromide is added, the mixture is set aside for twenty-four hours with occasional agitation, whereupon all but a trace of the extracts of cannabis and hyoscyamus is unceremoniously filtered out Any statement as to the quantity of cannabis and hyoscyamus extracts contained in the finished preparation is a mere guess and worse The quantity present is certainly not as given in the official dose statement, but a great deal less In view of the unsatisfactory formula, it is not to be wondered at that it has a usage of only 0 25 per 10,000 prescriptions, according to the Gathercoal survey

We must, therefore, either delete these insoluble ingredients or so modify the formula that they will remain in solution With this in view we have experimented a great deal and would like to propose deleting the "Compound Mixture of Chloral and Potassium Bromide," which would be entirely justified by its limited use, and to introduce the following preparation to supersede the one deleted

ELIXIR CHLORALIS ET BROMIDI COMPOSITUM

Compound Elixir of Chloral and Bromide

Synonym—Compound Mixture of Chloral and Potassium Bromide

Chloral Hydrate	62 5 Gm
Sodium Bromide	125 0 Gm
Soluble Gluside	0 5 Gm
Fluidextract of Cannabis	12 5 cc
Fluidextract of Hyoscyamus	25 0 cc
Alkaline Elixir of Eriodictyon (1), to make	1000 0 cc

Mix the solid ingredients by trituration in a mortar and dissolve them in 900 cc of alkaline elixir of eriodictyon Add the fluidextracts of cannabis and of hyoscyamus and enough of the aromatic elixir of eriodictyon to make 1000 cc Average dose 4 cc (1 teaspoonful)

---

* From the Laboratory of Pharmacology of the College of Medicine of the University of Illinois

Average dose contains

Chloral Hydrate	0 25 Gm
Sodium Bromide	0 50 Gm
Fluidextract of Cannabis	0 05 cc
Fluidextract of Hyoscyamus	0 10 cc

The following reasons for the modification of the N F V formula may be advanced

1 The new preparation contains the ingredients *in the relative proportion to their average dosage* the proportions of the "mixture" (N F V) being entirely irrational even if all of the ingredients were retained

PROPORTION OF ACTIVE INGREDIENTS

	Dosage in Mixture of N F V per Teaspoonful	Average U S P Dosage	Proposed Dosage per Teaspoonful
Chloral	0 8 Gm	0 5 Gm	0 25 Gm
Bromide	0 8 Gm	1 0 Gm	0 50 Gm
Ext Cannabis	0 008 Gm	Fldext 0 1 cc	0 05 cc
Ext Hyoscyamus	0 008 Gm	Fldext 0 2 cc	0 10 cc

The proportions advocated in the new preparation should make it much more efficient, in view of the fact that we have here a synergistic mixture in which each of the ingredients, producing sedative and hypnotic action in a different way, should "potentize" each other, increasing the desired effect, while the undesirable effects are less than would be produced by a larger dose of each of the ingredients It will be seen, for instance, that inasmuch as chloral is at least twice as powerful as the bromide the dose of the chloral and bromide are not in the proper relation in the old formula The same thing is true of the relation of cannabis and hyoscyamus dosage Furthermore, the dose of these two in the old formula is ridiculously small, even if all of it were retained

2 *All the active ingredients are retained* in the new formula there being no filtration To be able to do this we have introduced an elixir of high (approximately 50%) alcohol content to improve the solvent qualities of the vehicle

3 *To make the preparation as palatable as possible,* we have introduced the alkaline elixir of eriodictyon and added soluble gluside in the proportion of 1 to 2000

4 *The title "Elixir"* is proposed for the new preparation, because being sweet and alcoholic this title appropriately classifies it Furthermore, as has been shown by the Gathercoal survey, a Compound Elixir of Chloral and Bromide has much more extensive use than the Mixture

5 *The "average dose"* proposed for the new preparation contains one-half of the U S P average dose of each of the ingredients "Burgi's rule," which postulates that, "a mixture of substances each of which produces the same effect in a different way increases the potency of each of its ingredients," justifies one to believe that the proposed preparation, in teaspoonful doses, would have a greater sedative effect than half of the average dose of each of its ingredients Hence, a teaspoonful should be an effective dose If it is desired to give a full average dose of each of the ingredients, all that is necessary is to administer two teaspoonfuls of the new preparation which will, no doubt, act more powerfully than if each of the ingredients were given alone

CONCLUSIONS

1 It is proposed that the Compound Mixture of Chloral and Potassium Bromide be deleted from the National Formulary

2 That a Compound Elixir of Chloral and Bromide be introduced in its stead

3 This elixir to contain the active ingredients in the relative proportion of their average U S P dosage

4 The preparation to be stabilized and made palatable by means of the alkaline elixir of eriodictyon

---

THE PROTECTION OF PRESCRIPTION LABELS WITH LACQUER *

BY WILLIAM J HUSA[1] AND LYDIA M HUSA

Considering the dangers involved when mistakes are made in the use of medicines, it is of the utmost importance that pharmacists take proper precautions to insure the legibility of labels on prescriptions and to make sure that the patient understands the directions With the wide-spread use of the typewriter at the prescription counter, the difficulties arising from poor penmanship are disappearing Pharmacists who do not have typewriters available should take care to write legibly, using pens which are in good condition, it would also be advantageous to use a better grade of ink, such as India ink, which is so much more permanent than ordinary writing fluids

The better type of pharmacist pays particular attention to the labeling and other points in the finishing of the prescription and he may sum up his activities by saying that every prescription must be "right" when it leaves the store If a well-typed, properly affixed label becomes smeared and illegible through handling by the patient, the pharmacist is apt to feel that this is the responsibility of the patient He may say that the patient should be careful not to spill the medicine on the label, that handling with wet or soiled hands should be avoided, and finally that if the label shows signs of becoming illegible, it should be returned to the pharmacist for relabeling All this may be true, yet any pharmacist who critically examines his own home medicine chest will admit that the gradual loss in legibility of labels is a real menace The bad condition of many of the labels on prescriptions brought back for refilling is frequently a troublesome factor at the prescription counter

From these considerations it is evident that the adoption of a practical method for increasing the permanency of prescription labels would bring about a worthwhile improvement in pharmaceutical service The use of a label varnish naturally suggests itself and the older pharmaceutical journals often gave formulas for label varnishes, which, however, for one reason and another, have never come into general use by pharmacists

---

* Presented before the Section on Practical Pharmacy and Dispensing, A PH A , Madison meeting, 1933

[1] Head Professor of Pharmacy, University of Florida

NOTE See abstract of discussion in minutes of Section on Practical Pharmacy and Dispensing

During the past fifteen years, with the development of a new type of nitrocellulose giving solutions of low viscosity, and the introduction of synthetic resins and new solvents, great strides have been made in the manufacture and use of lacquers in the finishing of automobiles, furniture, etc The use of clear lacquer (containing no pigment) has come into use for protecting the bindings of books and similarly lacquer is used for increasing the permanency of shipping labels, etc

For the lacquering of labels, a quick-drying, colorless or light-colored lacquer is preferable Commercial label varnishes are now available which are advertised as being quick-drying, acid proof, alkali proof, oil proof, alcohol proof and washable These have been recommended for use in chemical stock rooms, research laboratories and museums

Since it appeared that the use of a suitable lacquer on prescription labels would be advantageous, we have made some tests along this line, using one of the commercial label lacquers It was observed that the lacquer penetrated the labels too much, making them somewhat translucent, particularly at first It was thought that this could be corrected by first applying a coat of U S P collodion Comparative tests were carried out, using coatings as follows on the labels of prescription bottles

No 1 Lacquer
No 2 Collodion + lacquer
No 3 Lacquer + lacquer
No 4 Collodion + lacquer + lacquer
No 5 Plain label (for comparison)

The coatings were applied with a half-inch lacquer brush Where successive coatings were used, they were applied five minutes apart

Examination of the labels showed that the use of an undercoat of U S P collodion was advantageous, as it dried rapidly and largely prevented penetration of the lacquer, which thus remained to a greater extent on the surface where it is needed In case of No 3 (two coats of lacquer), the drying appeared to be slow and this was further evidenced by the fact that the labels on two such bottles adhered when put away together after standing about half an hour after the coatings were applied

As a test of efficiency, aromatic fluidextract of cascara sagrada was smeared on the labels The plain label was badly stained, of course, and could not be washed without damage The label having one coat of lacquer (No 1) stained slightly and showed slight staining after washing with water, also it was evident that one coat gave insufficient protection against water In case of No 2 (collodion + lacquer) the fluidextract did not stain the label, which could easily be washed perfectly clean, this was also true of No 3 (two coats of lacquer)

From the results of our tests, the following recommendations are made

1 For prescription labels a coat of U S P collodion followed by a coat of label lacquer
2 For stock bottles bottles used in hospital wards, etc a coat of U S P collodion followed by two coats of label lacquer

The above recommendations are made on the basis that an extra coat of lacquer is desirable for bottles subjected to particularly hard or frequent usage, as in hospital wards

The protection of labels as described, making them washable and durable, is not a frill which can just as well be omitted, but represents, rather, a technique which should be used in every retail and hospital pharmacy In the hospital pharmacy, much time will be saved, since it will not be necessary to replace labels so frequently The permanence and greatly extended period of legibility of such labels will prevent accidents and save lives We need only recall the recent tragedy in an Australian hospital, where the life of a patient was lost because a young nurse administered belladonna instead of syrup of figs The report of the case (1) states that "both were ordinary white glass bottles, and the labels were stained and almost illegible '

There is no reason why pharmacists should not take pride in sending out prescriptions with labels which are not only legible when they leave the store, but which are so durable and washable that they will remain legible a long time afterward

A STUDY OF AROMATIC ELIXIR *

BY C O LEE AND MARSHALL CLOSE [1]

An elixir, similar in formula to the present official aromatic elixir was made official in the U S Pharmacopœia VI, with the title, Elixir Aurantii The synonym was Simple Elixir It was made by percolating cotton, which had been soaked with oil of orange The menstruum used was composed of water 3 parts and alcohol 1 part

In the U S Pharmacopœia VII, this elixir was replaced by Elixir Aromaticum, and the formula considerably modified Compound spirit of orange took the place of oil of orange of the previous formula and cotton as a filtering agent was replaced by precipitated calcium phosphate The only change in the formula in the U S Pharmacopœia VIII was that purified talc replaced the precipitated calcium phosphate Aromatic Elixir, in title, formula and process of making, has remained unchanged through the revisions of the Pharmacopœia since the Eighth

This fact should not be taken to mean that the formula is, in all respects, wholly satisfactory A review of the literature reveals that an endless number of complaints have been made about it, mainly, because it consumes so much time in filtering, while others are, that it is too sweet and its alcoholic content too high for certain uses as a vehicle

Like many of the workers who have preceded us in the study of this preparation, we have sought to acquaint ourselves with the problem, with the hopes of being able to suggest an improved formula To this end our study presents a review of the literature, under the following headings

---

* Section on Practical Pharmacy and Dispensing, Madison meeting, 1933

[1] Instructor in Pharmacy Ohio Northern University, Ada Ohio, Graduate Student School of Pharmacy Purdue University Summer Sessions 1931 and 1933

1 Flavoring Substances
2 Alcohol and Sugar Content
3 Clarifying Agents and Methods of Making

A summary of our studies and recommendations is also given

THE FLAVORING AGENTS USED IN AROMATIC ELIXIR

In 1871 (1) the Newark Pharmaceutical Association proposed the following formula for aromatic elixir

Cort Aurantii	4 drachms
Sem Coriand	2 drachms
Sem Angelicæ	2½ drachms
Cocci Cacti	1 drachm
Spt Vini Deod	12 ounces
Aquæ	10 ounces
Glycerinæ	5 ounces
Syrupi	5 ounces

Directions were given to percolate 2 pints This, it was stated is a pleasant vehicle for administering nauseous remedies" In the 1871 Report of the Committee on Unofficial Formulas of the AMERICAN PHARMACEUTICAL ASSOCIATION (2) a formula for simple elixir was recommended in which oils of anise, caraway, cinnamon and fennel were the chief sources of flavor In 1872 Eberback (3) percolated fresh orange peel, powdered star anise, and cardamon with equal parts of alcohol and water To this percolate syrup, caramel and the proper amount of water were added Hancock (4) in 1873 reported that a most satisfactory simple elixir could be made from spirit of orange Markoe, at the same time, expressed a preference for the tincture made from the fresh orange peel Later Hancock (5) proposed a formula which contained spirit of orange and cinnamon water as the flavoring agents About the same time Remington (6) objected to the use of oils for making the elixir and suggested a formula composed of orange water, cologne spirit and syrup, with Spiritus Vini Gallici as optional for the preparation

In 1875 the Committee on Formulas for Elixirs of the AMERICAN PHARMACEUTICAL ASSOCIATION (7), reported a formula for simple elixir that contained spirits of orange and cinnamon Maddox (8), in 1880 suggested the use of oils of lemon, cassia and caraway, in a simple elixir which he considered superior to any he had used

The United States Pharmacopœia VI contained a formula for Elixir Aurantii (simple elixir) with oil of orange as the only flavor 'The New York and Brooklyn Formulary of Unofficial Preparations' (11) proposed a formula for Aromatic Elixir, in which Aromatic Spirit was the flavoring agent Aromatic spirit was an alcoholic solution of the extractive principles of fresh orange and lemon peel, bruised coriander and oil of star anise The same formula together with four others, was proposed in 'A Preliminary Draft of a National Formulary' (12) The second of these formulas was composed of solutions of the oils of orange, cinnamon, anise, bitter almond and tincture of cardamon The third contained only oil of orange and orange flower water The fourth contained the tinctures of fresh orange and lemon peel and orange flower water The fifth was made by percolating cinnamon, nutmeg, cassia, cloves, myrrh and aloe with the addition of a small amount of orange flower water

Elixir Aromaticum U S Pharmacopœia VII contained compound spirit of orange as the flavoring agent In 1896, Ott (14) suggested that the elixir should be made from the oils rather than from the compound spirit of orange McIntyre pointed out that the use of the compound spirit of orange was a means of assuring greater accuracy in measuring small quantities of the oils and that the spirit would keep better than the oils so far as flavor was concerned In 1902, Bradford (16) suggested the use of tincture of sweet orange Scoville (19), two years later, proposed a formula, which, he said corresponded to the official product in character and strength but was an improvement in vigor and delicacy He suggested the use of the tinctures of fresh orange and lemon peel, oil of coriander and white wine Johnson (25) however after considerable experimentation decided that the official formula containing compound spirit of orange could hardly be improved upon as a flavor In 1912 Egan (29) said that the aroma and flavor of the

official elixir could be greatly improved by dissolving the compound spirit of orange in the alcohol and allowing the solution to remain in a refrigerator for 48 hours The *Druggists Circular* (34) printed a formula in which soluble orange was used The editor pointed out, however, that such flavors were looked upon with suspicion Beringer (39) suggested the addition of 20 cc of oil of cinnamon to each liter of the compound spirit of orange for this elixir Jones (41) suggested the use of terpeneless oils of orange and lemon together with anethol and oil of coriander in a concentrated soluble formula, 30 cc of which, when properly diluted with alcohol, syrup and water, made a good simple elixir

THE ALCOHOL AND SUGAR CONTENT OF AROMATIC ELIXIR

Aromatic elixir seems to have been used as a vehicle for a number of years before there was much question as to its sugar and alcohol content In 1902, Bradford (16) suggested an improved formula in which glycerin represented 25% of the total volume and contained neither sugar nor syrup Fleet (20) later proposed a similar formula which he termed, Elixir Aurantii Sine Saccharum Heffner (22) in 1906, suggested that care should be exercised in using the official elixir as a vehicle in children's medicines because of its high alcoholic content and because of its incompatibility with certain salts Johnson (25) also considered the alcohol content too high and after some study of the problem recommended a formula containing about 6 5% by volume of alcohol Fantus (38) suggested that the alcohol content of this preparation should be adjustable to any desired strength He proposed a formula containing 5% alcohol, capable of further fortification with alcohol as occasions required Egan (40) proposed a formula containing about 8% alcohol and approximately 35% by volume of glycerin He gave as his reasons for these changes, the prohibition regulations and the scarcity of sugar He claimed that his formula made a product not only equal in quality to that of the official preparation, but that it was cheaper

In 1923 Snow and Fantus (42) found objection to the high alcohol content of simple elixir and proposed a formula for an aqueous elixir which contained 5% of alcohol and 20% by volume of glycerin, the latter replacing the alcohol of the official formula They maintained also, that their formula was a better solvent for salts that are often prescribed The *Druggists Circular* (43), in commenting upon non-alcoholic formulas for simple elixir, said that without alcohol it would be lacking one of its principal ingredients A formula suitable for diabetics was proposed by Snow and Fantus (45) in 1930 It contained gluside 20 Gm , glycerin 200 cc , alcohol 250 cc and water enough for 1000 cc This formula, it is suggested, is miscible in all proportions with alcohol and water The alcohol content may be reduced by diluting it, in which case it would serve as a vehicle for the bromides

CLARIFYING AGENTS AND METHODS OF MAKING AROMATIC ELIXIR

The most vexatious problem connected with the manufacture of simple elixir is that of clarification Elixir Aromaticum is widely used as a vehicle, and it is generally acceptable, but there is almost universal complaint as to the time consumed in filtering it For this reason many workers have suggested numerous ways of speeding up the filtration time for this preparation To accomplish this without seriously modifying the formula has proved to be no easy task

In 1873 Hancock (5) used paper pulp as the clarifying agent, saying that it was free from the chemical objections of magnesium carbonate and chalk Even though the finished elixir was turbid, it could be used for some purposes In 1880, Maddox (8) used magnesium carbonate to clarify what he called a superior formula Moore (9) also recommended the use of magnesium carbonate Simple elixir, U S Pharmacopœia VI was made by pouring a solution of alcohol, 1 part, and water, 3 parts, over cotton packed in a percolator which had been wetted with oil of orange The sugar was dissolved in the percolate and the product strained "The New York and Brooklyn Formulary of Unofficial Preparations" (11) contained a simple elixir formula which was clarified with phosphate of calcium In "A Preliminary Draft of a National Formulary" (12) five simple elixir formulas were proposed For one of these, calcium phosphate was the clarifying agent for another, carbonate of magnesia and for two others, talcum Elixir Aromaticum, U S Pharmacopœia VII was clarified by the use of calcium phosphate In 1896 Ott (14) used precipitated calcium phosphate in a proposed elixir formula Talcum appeared in the

formula for Elixir Aromaticum U S Pharmacopœia VIII, replacing calcium phosphate in the formula of the previous issue Parry (15) suggested a formula which, he said, needed no clarifying agent if allowed to stand two weeks before filtering Dunning (17) saved time in making this elixir by adding the calcium phosphate to the mixture of compound spirit of orange, alcohol and water, in which, after filtering, sugar was dissolved This avoided the tediousness of filtering a thick syrupy solution Caldwell (18), in 1903, reported that the preparation could be made to filter clear at once, if mixed in the proper manner Fleet (20) advised sprinkling the filter paper with calcium phosphate, before filtering, rather than mixing it with the liquids as is usually done According to Toplis (21), simple elixir is, "one of the greatest time consumers of the U S P" He modified the official process by mixing the compound spirit of orange with the talcum To this was added the solution of alcohol and water, which was filtered after the manner of making official waters The required amount of sugar was dissolved in this filtrate Posey (23) speeded the time of making even more by mixing the talc, the compound spirit of orange and the water and then filtering The syrup and alcohol were then added to the filtrate Doyle (24), in 1909, used magnesium carbonate as the clarifying agent The mixture was allowed to stand until a clear supernatant liquid separated which, it is stated, filtered clear in a short time

In 1910, the *Western Druggist* (27) printed a formula in which it was suggested that the alcohol be added in part to the compound spirit of orange, talc and water and the mixture filtered The remainder of the alcohol was added to the syrup, which in turn was dissolved in the clear filtrate Dunn (28), under the title of 'Shortcuts and Improvements," suggested that the compound spirit of orange and alcohol be mixed with kaolin and filtered, and that water be added to this filtrate, in which sugar was then dissolved, and the whole filtered through cotton Five grams of magnesium carbonate, according to Sass (30), gave better results in filtering than did the required amount of talcum In 1913, Daniel (31) modified the official process for simple elixir somewhat, but said, "It is my opinion that quick and easy, and first class work are incompatibilities" Possehl (32), in 1914, suggested that the official elixir could be improved by first making a water, in the usual way, from the compound spirit of orange and talc, and adding to it the syrup and alcohol Fried (33), in 1914, said, "one of the easiest preparations to make is aromatic elixir providing a few changes in procedure are made" He suggested that the syrup should be replaced by sugar and added after filtration and then the whole strained, if necessary Satz (35) filtered the aqueous-compound spirit of orange mixture with talc and to this added the syrup and alcohol Scher varied this a little He filtered the compound spirit of orange, alcohol and water mixture with talc and added the syrup to the filtrate Burge (36) followed Scher's procedure but used paper pulp as the clarifying medium Concerning aromatic elixir, Cook (37) said, "It is unfortunate that the purified talc which is not a satisfactory filtering medium, was not replaced by purified siliceous earth (Kieselguhr), which has been made official" Purified siliceous earth not only speeds the rate of filtering but clarifies the elixir promptly Egan (40) maintained that the use of purified siliceous earth, as compared to talc, resulted in clearer elixirs Jones (41) spoke out of much experience with simple elixir when he said, "Its clarification is very trying on one's patience, and the usual result is a cloudy preparation, even after many repeated filtrations" After a study of the effect of various clarifying agents upon "The Hydrogen-Ion Concentration of Aromatic Elixir," Krantz and Carr (44) concluded that normal magnesium carbonate is admirably suited for use as a filtering agent in this preparation, because it filtered rapidly and yielded an almost neutral elixir In 1930, Shiflett (46) offered a modified procedure quite similar to one reported in 1910 (27) A solution of 150 cc of alcohol and 300 cc of water is made The compound spirit of orange is then triturated with the talc and mixed with 350 cc of the above alcohol water solution After filtering, 375 cc of syrup are added to the filtrate To this is added the remaining 100 cc of alcohol, and then water enough for 1000 cc It is claimed that this process requires but one tenth the time of the official procedure 'If there is any discrimination in flavor, it is in favor of this non-official process' Silver (47) found fault with Shiflett's procedure and offered a slightly different one Burlage (48), in 1932, studied five methods for making simple elixir 1 The U S P method modified as to the order of mixing, 2 The U S P procedure unmodified, 3 Shiflett's Method, 4 Silver's Method, and 5 The U S P Method, modified by using double the specified amount of talc As to speed of filtration, he rated the methods of Shiflett and Silver about equal and superior to the present official and proposed modifications

Fantus, Dymewicz and Dymewicz (49), in 1933, criticized several methods and formulas, which have been proposed They formulated the three following rules for preparing the elixir 1 The viscosity must be kept low until after clarification 2 Filtration through talc and other absorbents must be abandoned, because it consumes time and wastes oil 3 One must avoid precipitating the oil globules so fine that they will pass through a filter paper and, in turn, a longer time for saturation should be allowed They propose making the elixir by mixing all of the water with the alcohol, adding the compound spirit of orange, and allowing it to stand for 24 hours being frequently agitated, then filtering through a hard filter, without the use of any absorbent Lastly dissolve the sugar in the filtrate

EXPERIMENTAL PART

In the face of the rather discouraging results of many workers, to speed up the time of filtration of Elixir Aromaticum without the loss of its very acceptable aroma and flavor, we attempted the impossible It was decided at the outset that the time consumed in filtering the official simple elixir is an item of no mean consideration Furthermore, it was assumed that it would be rational to sacrifice, if necessary, a part of the flavoring qualities of the present formula, for one slightly less pleasing, if the objections to the present process could be removed We have tried, in the work we have done, to incorporate the suggestions of other investigations, although not always in agreement with them upon every point

In an attempt to speed up the process for making aromatic elixir, a series of 14 elixirs were prepared The U S P X formula and procedure were used as a basis for the several modified formulas All deviations from the official formula and procedure are noted for each modification 1000-cc quantities were prepared in most cases

THE MODIFICATIONS

1 Elixir Aromaticum, U S P X The formula and procedure of the Pharmacopœia were used and followed and are not repeated here

2 Paper pulp was substituted for purified talc

3 Washed talc was substituted for the official talc This was prepared by washing the talc repeatedly with water by decantation for the purpose of removing all of the very fine filterable particles

4 The compound spirit of orange was mixed with the talc, to this was added, in portions, the syrup, alcohol and water previously mixed This was allowed to stand 24 hours and filtered in the usual way

5 Water and sugar were substituted for the syrup

The compound spirit of orange was dissolved in the alcohol, and water added in portions to make 818 cc This was mixed with the talc and filtered The sugar was dissolved in this filtrate and made up to 1000 cc by the addition of a solution of alcohol 1 and water 3 (This is the method of Toplis *q v* (21))

6 After the method of Scher, *q v* (35) the compound spirit of orange, alcohol and water were mixed with the talc and filtered as usual The syrup was added to the clear filtrate and the quantity made up to 1000 cc according to the official method

7 Glycerin, 125 cc , was substituted for an equivalent amount of syrup The compound spirit of orange, alcohol, water and talc were mixed and filtered, as officially directed The syrup and glycerin were added to the clear filtrate and the volume made up to 1000 cc as usual

8 An elixir was made by saturating the solvents The alcohol, syrup and water were carefully mixed Compound spirit of orange was then added dropwise, with shaking after each addition, until the solution became saturated

9 Number eight was repeated with a slight change in the solvent 125 cc of glycerin were used to replace an equivalent amount of syrup The alcohol, glycerin, syrup and water were then mixed Compound spirit of orange was then added as in number eight

10 An elixir was prepared according to the Shiflett formula (46) Dilute 150 cc alcohol and 300 cc of distilled water 350 cc of this solution were mixed with the mixture of talc and compound spirit of orange, and the whole filtered The filter was finally washed with the remaining 100 cc of alcohol and water solution Syrup was then added to this filtrate, in divided portions with agitation after each addition The remaining 100 cc of alcohol was then added and the volume made up with water, if the amount needed was small, with alcohol 1 part and water 3 parts, if the amount needed was large

11 Sugar and water were substituted for syrup The compound spirit of orange and talc were mixed 575 cc of water were added to this mixture and the whole agitated frequently for 15 minutes and then filtered in the usual way In 550 cc of the clear filtrate, 320 Gm of sugar were dissolved, 250 cc of alcohol then added and the volume made up to 1000 cc by addition of the first clear filtrate

12 The U S P simple elixir was prepared, using purified siliceous earth instead of the talc

13 The U S P simple elixir was prepared, using kaolin instead of the talc

14 The U S P simple elixir was prepared using magnesium carbonate instead of the talc

TABLE I

Formula No [1]	Appearance of Finished Product			Times Filtrate Was Returned Before It Cleared [2]	Rank as to Time Required to Prepare [3]	Condition after Two Years [4]		
	Clear	Cloudy	Colored			Odor	Taste	Sediment
1	cl			7	13	g	g	s
2	cl	f		22	14	g	g	s
3	cl			4	11	g	g	s
4	cl			5	12	g	g	s
5	2 w	1st		4	10	g	g	pro
6	2 w	1st		4	8	g	g	s
7	2 w	1st		4	9	g	g	pro
8		clo		nf	5	p	p	oil
9		clo		nf	6	p	p	oil
10	2 d	1st		3	7	t	t	s
11	cl			3	3	g	g	s
12	cl			1	4	g	g	
13	cl			2	2	g	g	
14	cl		sy	0	1	g	g	

ABBREVIATIONS cl, clear, 2 w, after 2 weeks 2 d after 2 days f faintly, 1st at first, clo cloudy, sy, slightly yellow, nf not filtered g, good, p, poor, t, terebinthinate, s, slight pro, pronounced, oil, oil on surface

[1] See preceding pages for formulas and methods of making

[2] Approximately 100-cc portions were returned each time

[3] Number one required the shortest time about an hour, and the longest time about 24 hours [4] Two years' time applies to Nos 1 to 11, about two months only to Nos 12 13 and 14

Table I gives, in brief, our observations of the fourteen modifications of the simple elixir made as outlined above They were observed (1) with respect to clearness and color, (2) the number of times that it was necessary to return 100-cc portions back through the filter before the filtrate became clear, (3) a comparative scale of the speed or time required to complete each product, and (4) condition as to odor, taste and sediment after standing in storage for two years

The results, as expressed in Table I, verify many of the observations of other workers upon this problem, as for instance the difference in filtering time with talc as compared to purified siliceous earth or magnesium carbonate

A SIMPLE ELIXIR OF LOW ALCOHOL CONTENT

We are cognizant of the objections that have been made to making a simple elixir by the so-called "aromatic water" method and also that it has been said that aromatic elixir with little or no alcohol in it is without one of its very important constituents Even so we chose to experiment with formula Number 11 which has been given Three lots were made by the "aromatic water" process These were termed Lots A, B and C and each contained successively smaller percentages of alcohol Lot A contained 15% alcohol, Lot B, 10% and Lot C, 5% These three lots kept perfectly for more than six weeks The only difference in taste that we could detect, was attributed by us to the alcoholic content We therefore concluded that a reasonably good aromatic elixir, with any desired alcohol strength, is possible

SIMPLE ELIXIRS AS OTHER ELIXIR VEHICLES

A Elixir Glycyrrhizæ U S P X—Since Elixir Glycyrrhizæ is a preparation composed chiefly of aromatic elixir, five lots of it were prepared using the modified formulas numbered 1, 11, 12, 13 and 14, previously described These five lots were observed over a period of several weeks They were, from all appearances, quite alike, even in the slight sedimentation that resulted

B Elixir Potassii Bromidi N F V—Approximately 30% Aromatic Elixir is contained in this preparation Three lots of it were prepared, using elixir modification formulas, numbering 1, 11, and a modification of number 11 containing but 10% alcohol described as Lot B in the paragraph under "A Simple Elixir of Low Alcoholic Content"

These three preparations were made according to the official directions They were studied over a period of several weeks No observable differences between them were noted during this time

These observations, though few in number, do indicate that some of the modified simple elixirs, which have been described, are usable and seem to compare well in that respect with the official elixir which is tedious to prepare and of questionable alcoholic content

A PROPOSED SIMPLE ELIXIR FORMULA

As a result of our study of the official simple elixir, especially with respect to

the difficulties of making, as well as to other objections that have been made, the following formula and method are suggested for the preparation of aromatic elixir

Compound spirit of orange	12 cc
Purified talc	30 Gm
Sugar	320 Gm
Alcohol	The desired amount
Distilled water, to make	1000 cc

Carefully mix the compound spirit of orange and talc by trituration Add about 800 cc of water, in convenient portions, and triturate after each addition Agitate frequently for about 15 minutes and filter in the usual manner Dissolve the sugar in 550 cc of the clear filtrate and to it add the amount of alcohol desired *Finally make up to 1000 cc with the required amount of* the clear filtrate

CONCLUSIONS

Although this recommended formula may contain somewhat less of the flavoring principles than does the official elixir, we think it is sufficiently strong in flavor to serve as a good vehicle We recommend it for the following reasons

1 The time required to prepare it is approximately one-tenth that necessary for the present official simple elixir

2 The alcohol strength of this elixir may be varied at will without modifying the technique of making

3 The preparation is always the same clear product regardless of a variation in the alcoholic content

PURDUE UNIVERSITY SCHOOL OF PHARMACY
LAFAYETTE INDIANA

C LEWIS DIEHL *

BY JOHN E KRAMER

The name Diehl is synonymous with pharmacy, pioneer and progress C Lewis Diehl's connection with the first is well known to every one acquainted with the history of American pharmacy This profession was evidently his very life and being, as attested to by his career

That he was a pioneer can be seen in a cross section of his advancement through life Less than fifty years after the Philadelphia College of Pharmacy had been founded in 1821, Mr Diehl was the founder of the Louisville College of Pharmacy in Louisville, Ky , and was elected and reelected, successively, president of that institution for eleven years He proved to be a pioneer as one of the members of the first Board of Pharmacy of Kentucky, retaining that post for twelve years He opened two drug stores in Louisville, and was one of the pioneers in research work along pharmaceutical lines, being noted for his work on percolation, along with Procter, Squibb and others of his time Incidentally, this process of extracting the principals of drugs by percolation, developed in America, remained a typical American process, as the European countries never became enthusiastic over the idea, and almost totally ignored it

Pharmacy, in the time of Diehl, was in an early stage of organization in the south and southwest, and also in the matter of research and the establishing of American pharmaceutical customs Prof Diehl was indeed a leader of the pioneers in these fields

The third synonym is progress Something once started must be continued, to make it worth while Professor Diehl applied this idea to pharmacy, for, after

* Section on Historical Pharmacy, A PH A , Madison meeting, 1933

establishing the College and the State Board, he continued to serve with them, in some capacity, until his death His connections with the local and national pharmaceutical associations were not stationary, but progressive As the Reporter on the Progress of Pharmacy for the AMERICAN PHARMACEUTICAL ASSOCIATION, Diehl's reports were pieces of masterful, scientific work In the year in which he was president of this organization, 1874, his report filled 278 printed pages and comprised the greater bulk of the YEAR BOOK Reports of this great length and scope were customary to the man As one member stated, his reports alone were worth the yearly dues

Professor Diehl was also associated with the revision committees of the United States Pharmacopœia and the National Formulary, doing his greatest work with the N F committee as chairman of that body His connections with both these books of pharmaceutical standards helped in the great work of revision by preventing duplication of formulas and contents Again progress was his watchword

A short sketch of Prof Diehl s life shows his continued work for pharmacy He was born in 1840 in Bavaria, and at the age of eleven came to America, immediately entering a school near St Louis Three years later he left the school and came to Philadelphia to be with his father His first job was with a perfumer and drug sundryman, but soon after became apprenticed to a pharmacist-physician While serving his apprenticeship he attended the Philadelphia College of Pharmacy and graduated in 1862 After service in another drug store he entered the employ of John Wyeth and Brother

The Civil War then became the foremost topic and action of the day and Diehl answered the call to arms, serving in the 15th Pennsylvania Regiment until he was severely wounded at the battle of Stone River, from which wound he never fully recovered Until the close of the war he served the Government as a chemist, and then went to Louisville to become manager of the Louisville Chemical Works

It was in that city that he did his pioneer work of establishing his stores, the College and the State Board, and served as president of the Kentucky Pharmaceutical Association From there, too, he conducted all his activities with the various committees of national scope, and in that city he died, in 1917

Professor Diehl was a constant contributor to journals and conducted many scientific researches His reports were masterpieces of science, well balanced and constructive In recognition of his work he received the honorary degree of Master of Pharmacy from the Philadelphia College of Pharmacy and Science, in 1887

Friendship and respect he won, his passing brought forth many sincere expressions of sorrow from men of foremost importance in all walks of life There was not so much of the romance about Professor Diehl as with others of his and earlier times Simplicity and earnestness marked his endeavors for pharmacy and his only ambition was the furtherance of his beloved profession

LaWall's ' Four Thousand Years of Pharmacy '

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS DEPARTMENT

Editor's Note Do colleges of pharmacy give sufficient work in pharmacology? I believe I agree with Dean Serles that they do not and that, with the extension of the course to four years, this should be corrected However, the cost of a laboratory course in pharmacology to a large group of students may be expensive unless great care is taken to keep the expenses down Demonstration by the instructor of the pharmacological reactions that "run into money" will be helpful but a course that consists entirely of such demonstrations will not suffice Dean Serles has presented a sane view of the problem and has given suggestions that will be helpful to any college contemplating such a course —C B JORDAN, *Editor*

OUR FOUR YEARS' EXPERIENCE WITH THE TEACHING OF PHARMACOLOGY AT SOUTH DAKOTA STATE COLLEGE

BY E R SERLES *

The advent of the four-year course as a minimum requirement for graduation from member colleges of this association has brought forth a divergence of opinion as to what subject material, new or old, should properly receive further development The Syllabus published in the latter part of 1932 has projected an outline of the old and some new courses, which although not obligatory, will undoubtedly influence many of the schools and colleges in reshaping their curricula Perhaps the most radical departure from the old order advocated by the Syllabus Committee was the dropping of the term Materia Medica and the inclusion of the term Pharmacology in lieu thereof

Pharmacology is not a new science It is not new to Pharmacy for our leading pharmaceutical houses have been employing a knowledge of its fundamental principles in drug standardization for many years

The teaching of this science in colleges of pharmacy is, however, new A survey of our college catalogs of a few years ago fails to show more than one or two schools engaged in the teaching of any phase of pharmacology except posology and toxicology and in most cases such courses were wholly didactic

Realizing the value of laboratory demonstration in the teaching of chemistry, pharmacy and dispensing, we of the faculty of State College conceived the idea that the teaching of dosage and related functions of drugs could be more easily accomplished if we could but show the effects of a single drug or a group of drugs upon living organisms

Perusal of medical college catalogs and laboratory outlines of courses in pharmacology offered in such schools, together with experience gained in the chemical war service clearly indicated that a course in pharmacology for pharmacy students was feasible and, what was more important, desirable

Pharmacology was accordingly offered as an advanced elective to those students who had completed courses in physiology, pharmacognosy, materia medica and chemistry The ease with which they adjusted themselves to the complicated laboratory procedure of taking a blood pressure, giving anesthetics, hypodermic and

* South Dakota State College

intravenous injections proved to us that here was a means of fixing the facts covering drug action and dosage long overlooked in our methods of teaching this important part of a pharmacist training

Dr M R Thompson in a paper before this group emphasized the adaptation of pharmacologic procedure to bioassays as being the phase of pharmacology which should receive our attention when trying to build a course for pharmacy students This may be true, but it has been my experience, and particularly so as a member of the U S P Bio-assay Committee, that this part of the work is highly specialized, and requires the best of apparatus, controlled conditions and a profound knowledge of the fundamentals of pharmacology, if more than just the technique of the experiment is to be demonstrated

Again we must keep in mind that if we are to drop the subject hitherto known as Materia Medica, and put in its place Pharmacology, we must provide some means of conveying to the student a knowledge of that vast wealth of information concerning the origin, composition and properties of remedial agents Such information, I believe, should be included in the courses of pharmacognosy, if the material is of a crude drug nature and in the courses of pharmacy if the substance be a chemical

For the past four years we have been shaping our courses with this end in view Pioneering in this field we have made mistakes, but most of them have been on the side of omission rather than commission

First, we found our students lacking in a knowledge of physiology and comparative anatomy, especially of the smaller animals used in experimental work *Second*, the ability to interpret physical phenomena, such as rate of injection, kinds of material injected and site of injection were problems for both the operator and student to master *Third*, organization of laboratory experiments, so that the cost of operation is not too great is necessary for one must recognize that pharmacology properly taught is expensive The source and care of laboratory animals is the chief factor in determining the cost of the course once the laboratory is equipped

The course as it has been given has been chiefly for advanced students, where the numbers were few, consisting of two lectures per week and two three-hour laboratory periods I should like to emphasize the fact that the laboratory periods should be at least three hours in length and could well be extended to a full half day for the more extensive animal experiments

Our new course designed to include the students who are to receive a general training for the practice of retail pharmacy will consist of three lectures per week on the theory of drug action and a single laboratory period, chiefly demonstration

In this connection I assume that you will be most interested in the laboratory procedures For convenience we have divided these into two groups

Chemical Experiments		*Excretion of Drugs*
Important reactions of	Methanamine	Phosphate, etc , in the urine
	Formaldehyde	Iodine in the saliva
	Alcohols	Physical chemistry of soaps and emulsions
	Phenols	Action of indicators, U S P , etc
	Salicylates	Buffer value of phosphates

Antiseptics
Phenol co efficient, etc
Common uses
Astringents
Effects on tissues
Effects of acids and alkalies
On protein
On mucous membrane
Preparation of colloidal solution gels
Importance in drug action

Physiological Experiments

Irritants and demulcents
On skin and mucous membrane
Local anesthesia on a frog
Local anesthesia on a man
Administration of anesthetics (rabbit)
Ether
Chloroform
Chloral hydrate
Magnesium sulphate
Effects of (rabbit)
Morphine
Chloroform
Chloral hydrate
Magnesium sulphate
Action of (frog, guinea pig and cat)
Digitalis
Atropine
Pilocarpine
Effect of drugs on circulation (dog or rabbit)
Demonstration
Effects of drugs on G I tract (rabbit)
Demonstration

This course will be given throughout the senior year and will be supported by the courses in Dispensing The course as originally given will be continued for graduate study

I am certain that the work which we have been giving during the past four years has enabled our students to have a better understanding of the whole field of therapeutics It has impressed upon them the need for care in preparing sterile solutions for hypodermic injections, intravenous use of glucose, and an accurate physiological salt solution

They know why a doctor prescribes an Eggleston dose of digitalis, because they have seen its action in an animal They understand the normal functions of the human body better, and are, therefore, entitled to be considered by the physician as an indispensable aide in his service to the patient

---

THE INTER-RELATION OF THE DEPARTMENTS OF PHARMACOGNOSY, PHARMACOLOGY AND CHEMISTRY

Editor's Note Education should not come in separate packages" wrapped and labeled chemistry pharmacy pharmacology etc , because all of these subjects are inter dependent and should dovetail with each other This dovetailing cannot be successfully done without an effort on the part of the instructors Professor Christensen points the way for such cooperative efforts —C B JORDAN

BY B V CHRISTENSEN *

Inasmuch as this paper is to be presented before a group of teachers of chemistry it is presumed that you will be interested in a few suggestions pertaining to the chemical training of students deemed desirable by teachers of pharmacognosy and pharmacology The suggestions offered herewith relate more particularly to the nature rather than the scope of chemical knowledge which teachers of pharmacognosy and pharmacology consider essential as aids to a proper understanding and appreciation of these subjects by students As a matter of fact, if you would

* Professor of Pharmacognosy and Pharmacology, School of Pharmacy, University of Florida

permit a criticism, I would say that your weakness lies in quality rather than quantity However, inasmuch as the writer is not a chemist, this discussion is not to be considered a critical review of the teaching of chemistry It is intended only to offer a few suggestions as to the nature of the chemical knowledge which is of particular value to students in acquiring an understanding and appreciation of the subject matter of pharmacognosy and pharmacology No attempt is made herewith to classify chemistry under its various subdivisions such as inorganic, organic, physical, etc , and especially in view of the fact that some of the suggestions offered might apply to all or any one of the various subdivisions

INTERPRETATION OF CHEMICAL LANGUAGE

First and foremost, we should like to have students well trained in the reading of and interpretation of chemical language A chemical equation, for instance, is a statement of a chemical fact or theory As a matter of fact, in many cases a chemical equation is a paragraph or a page of information to those who know how to read and interpret Take, for instance, the simple equation, $NaOH + HCl = NaCl + H_2O$ If this is true, it tells us that one molecule of sodium hydroxide will combine with one molecule of hydrochloric acid to form one molecule of salt and one molecule of water It also tells us that 40 Gm of sodium hydroxide will combine with 36 5 Gm of hydrochloric acid to form 58 5 Gm of salt and 18 Gm of water We might use Mg or pounds or tons in the same proportion Again it may tell us that the valence of chlorine is one, of oxygen two, of sodium one and so on This is simple, of course, but illustrates the point in mind

A chemical formula also should convey considerable information to a student From it he should be able to classify the compound as an alcohol, aldehyde, alkaloid or whatever it may be He should also be able to predict stability and reactivity and, the nature of compounds formed as a result of the reaction, *i e*, he should be able to predict polymerization, addition or substitution He should be able to predict at what point the reaction might occur and thus suggest possible new compounds and the nature of such as for instance, the barbiturates

We expect students to know at least the elementary principles of nomenclature so that they will recognize the same substances under different chemical names and so that from a given formula they may derive a correct chemical name This also applies to ide, ate, ite, ic and us endings We expect also that students know enough about isomerism to appreciate why it is that two substances may have the same empirical formula and yet differ as to physical properties and physiological action

From the above viewpoint we might compare chemistry to a new language, and proficiency in chemistry, therefore, depends to a large extent upon the quality and scope of the chemical vocabulary of the student

NATURE OF SUBSTANCES

Second, we should like to have students come to us well informed as to the nature of substances They should appreciate thoroughly that substances are recognized and differentiated by means of their properties, both physical and chemical Students should have clear and definite knowledge as to the meaning and significance of specific gravity, melting point, boiling point, solubility, optical rotation,

refraction, etc When he is told that the specific gravity of a substance is 2 3 at 4° C , he should be able to determine the weight of a given volume of that sub stance When given weight and volume, he should be able to determine specific gravity and when given specific gravity and weight he should be able to determine volume We expect students to know the nature of such substances as fats, fixed oils, carbohydrates, glucosides and gums I mention these particularly for the reason that in my experience these have offered the greatest difficulties It is not enough for students to know that fixed oils are made up fundamentally of glycer-ides of fatty acids but they should know the nature of the more common glycerides such as olein, linolein, palmitin, etc Are these glycerides liquids or solids, how do they differ as to consistency, melting point, color and other pertinent properties? If the students know the nature of the more common glycerides, they have less difficulty in understanding and appreciating why we have several fats and fixed oils official and how they differ from each other

With respect to the nature of substances, qualitative tests should not be over looked Students should be trained in the use and application of such tests in recognition and differentiation of substances Finally, we expect students to be able to make quantitative determinations both gravimetric and volumetric and, in this connection, we suggest that students not only be carefully instructed but drilled on the meaning of the various terms used in connection with volumetric solutions, such as normal, tenth-normal, half-normal, etc , and considerable prac-tice be required in preparing and standardizing such solutions

PROCESSES

Third and last, we expect students to have a knowledge of processes For instance, students should be proficient in performance of the various processes used in determining specific gravity for the several types of substances such as those insoluble in and heavier than water, insoluble in and lighter than water, substances soluble in water and for which some other liquid must be used, liquids, powdered or granular substances and so on We expect them to know how to determine melting point, boiling point, optical rotation and solubility Again, students should be able to purify substances by crystallization or sublimation or fractional distillation or by selected solvents They should understand the differences be tween direct steam distillation, indirect steam distillation, destructive distillation, fractional distillation, distillation under reduced pressure and the principles under-lying each process

In closing allow me to state that I appreciate the fact that you are not teaching your students fundamentally for the purpose of preparing them for pharmacognosy and pharmacology However, it does appear that you are training your students for future needs, some of which occur during their college life Hence, if the stu-dents need the foundation in chemistry outlined above, it seems logical that their courses in chemistry should include such instruction both as to character and scope of information Let me remind you again, that as far as pharmacognosy and pharmacology are concerned, it is desirable to emphasize quality rather than quan tity of chemical information

---

Eighty-second annual meeting of AMERICAN PHARMACEUTICAL ASSOCIATION and dedication of the American Institute of Pharmacy during week of May 7th See Transportation under department "Societies and Colleges "

THE CONFERENCE OF PHARMACEUTICAL LAW ENFORCEMENT OFFICIALS

MINUTES OF THE SESSIONS HELD IN HOTEL LORAINE, MADISON, WIS., AUGUST 31 AND SEPTEMBER 1, 1933

The fifth annual meeting of the Conference of Pharmaceutical Law Enforcement Officials was convened by Chairman R. L. Swain, at 9:00 A.M. in the Colonial Room, with the following present: Messrs. H. H. Schaefer and F. C. A. Schaefer, of New York, Pierce, of Maine, McShane, of Vermont, Jones, of South Dakota; Childs, Milne, King and Reese, of Kansas, Hayman, of West Virginia, Bingham, of Alabama, Meads, Teeters, Slocum, Judisch, of Iowa, Hankins, of Florida, Costello of North Dakota, Henry, Durham, of Michigan, Fischelis of New Jersey, Nye, of Missouri, Monias and Christensen of Illinois, Netz, Bender of Minnesota, Wilson, of Georgia, McCullough, Russell, of Indiana, Wilcox, of Pennsylvania, Philip, California, Jelinek, of Minnesota, Kremers, of Wisconsin, Kelly, Eberle and Swain, of Maryland, Ford, of Ohio.

Chairman Swain delivered his address and upon motion duly seconded, same was received for publication.

THE CHAIRMAN'S ADDRESS

BY R. L. SWAIN

In presenting this address to the Conference of Pharmaceutical Law Enforcement Officials, I shall endeavor to establish one or two general propositions to which I think we should devote our earnest thought. First of all I think it is our responsibility to point out the defects existing in the pharmacy laws, and to take the lead in having these defects corrected. Secondly, we should do all that we can in our official capacity, to acquaint the public with the basic significance of pharmacy to public health. I couple these two thoughts together because I am not able to see any way of correcting the defects in pharmaceutical legislation unless our efforts are based upon the public function which pharmacy renders. The whole field of drugs and medicines is so closely connected with the public welfare that pharmaceutical legislation should seek to lodge its regulation and control with the pharmaceutical profession. I have no difficulty in feeling that proper and adequate pharmaceutical legislation is a logical and certain outcome of a due regard, on the part of the public, of the work which pharmacy does.

Assuming that these propositions are sound and I doubt that any will contend against them, then it seems to me that enforcement agencies should carefully study existing laws, with the view of evaluating their effects upon the community.

Legislation, restricting the practice of pharmacy and the distribution of drugs and medicines to persons meeting lawfully established standards of education and experience, has long been a part of the public general laws of every state. The constitutionality of this legislation is no longer open to question. It is well established that such restrictive regulation and control is a proper exercise of the police power of the states. The police power of a state is the inherent sovereign authority under which its legislature may, within constitutional limits, prescribe the laws and regulations to safeguard the safety, health and morals of the people, prevent fraud and oppression, and promote the public convenience, prosperity and general welfare.

The purpose of these laws is to surround the distribution of drugs and medicines with certain definite legal precautions. Competency and skill are required of those seeking to engage in this important activity.

However, a casual study of the pharmacy laws discloses some major defects. While they do set up generally satisfactory standards for purely professional pharmaceutical practice, all of them recognize certain exceptions and exemptions which go far to defeat their public purpose. As a very general rule, pharmacy laws permit the free and unlimited sale of patent and proprietary medicines and the commonly used household or domestic remedies. True, the language varies, but the meaning and import are the same. This condition is far from new. It seems to have been coexistent with pharmaceutical legislation in this country. The first pharmacy law enacted in this

country was, so far as I have been able to learn passed in South Carolina in 1817 Among its interesting provisions, was one stating that it should not apply to the sale of home made remedies and such as were obtained from manufacturers in shape for lay use From that early day, no pharmacy law has been passed without making liberal exceptions in behalf of patent and proprie tary medicines

It should be admitted, I think that there was once some valid basis for the exceptions Drug stores were not as easily accessible as they are now, and hence, general dealers were permitted to handle drugs and medicines Transportation and the lack of the modern means of communica tion also had to be taken into consideration when legislation of this type was being considered Also the pharmacist or druggist was not accepted as an educated man In those early days, he was a merchant carrying drugs and medicines as a side line As a logical result drugs and medicines were looked upon simply as articles of merchandise, and as such, could be handled with out restriction or control This view finds recognition in early court decisions, in which all at tempts at restriction were set aside Being mere articles of merchandise, no reason was acceptable to justify permitting their sale by some and prohibiting it to others Under the light of changed conditions we may well question the wisdom of perpetuating the old points of view For instance good roads telephones, automobiles have annihilated distance and the drug store is, in most sections of this country, convenient to the people Also, the pharmacist is now a man of college and university training and well qualified to serve the public in a professional capacity and to advise in the use of drugs and medicines Also, such salutary legislation as the Food and Drugs Acts has done much to drive the merchandise conception out of medicine and to reserve the field for such preparations as are reasonably safe Drugs and medicines are more and more becoming health adjuncts and thus perhaps more definitely belonging in the hands of persons of training and experience The final report of the Committee on the Costs of Medical Care has focused attention upon medical problems and has made the specific recommendation that the standardization preparation and distribution of drugs and medicines be restricted to pharmacists in so far as this is possible and practicable

It would be possible to record other changes which have come about, and to show that the old bases of the exceptions no longer exist However, perhaps the most significant development in the whole matter and the one deserving of the most careful study at our hands, has been in the nature of the products which may be defined as proprietary I think it can be said that the early use of the terms patent and proprietary medicines was in keeping with the general accepted meaning of the terms While the words were "patent and proprietary medicines " the phrase had no implications beyond the usual patent medicine The word "proprietary " was synonymous with and descriptive of the word, patent " Thus a proprietary medicine was no more than a patent medicine That the conditions have changed is quite obvious There has long been a marked drift away from manufacturing in drug stores, and to a concentration of production in the large pharmaceutical manufacturing plants Concurrent with this change has come about the pharmaceutical specialty under special trade marked names Many complex and potent prepara tions can be obtained under short and easily remembered names The great research laboratories of the pharmaceutical and chemical plants are turning out a continuous and ever-growing list of special preparations, the property rights to which are owned by the companies themselves The chemo therapy age which now exists, is bending its every energy to the production of specialties for the treatment of disease In most cases, these products are complex potent, frequently dangerous and are invariably obtainable under short trade names While these products vary tremendously in their nature, use toxicity and adaptability to disease they are all alike in that they are proprietary products " Some concern has a property or proprietary right to the patent under which they are produced and to the name and package in which they are sold Thus, in an important sense as soon as the most dangerous research product becomes available to the public it also comes to the public as a 'proprietary" product or medicine There may be little general knowledge regarding it the medical profession may consider it as in the experimental stage, the public may be totally unacquainted with it, and yet under the pharmacy laws them selves, enacted in the public interest such products may be handled and sold by anyone irrespec tive of skill and training In other words, the exceptions in the pharmacy laws still make it possible for the most dangerous products to be distributed to the public as merchandise

To show the absurdity of the present conditions, it can be said that in one state camphor

ated oil may be sold only by a registered pharmacist, while veronal, barbital, amytal and many others may be sold by anyone In most states no distinction is practiced and patent and proprietary products and the usual domestic remedies are freely available from any and all kinds of retail dealers The mere fact that the evident and obvious legislative intent was to permit free sale of patent medicines and the commonly used household remedies has not prevented dangerous proprietary preparations from being just as freely sold and distributed

It must be apparent to all that such a condition is certainly not in the public interest In fact, it seems greatly inconsistent with the main purpose of all pharmaceutical legislation

As I see the matter, our whole system of pharmacy laws should be carefully studied Many of the provisions should be entirely rewritten An intelligent and earnest effort should be made to make them more stringent, and thus more effective The broad general exceptions in favor of general merchants should be removed and reconsidered in the light of prevailing needs and prevailing conditions

I urge, as a beginning that the Conference approve the appointment of a committee to carefully study the significance of the terms ' proprietary preparations ' and patent medicines " so that these may be defined in the light of present scientific knowledge, and with due regard to the demands of public health

Upon motion of Mr Childs seconded by Mr Milne a motion was adopted that the incoming chairman appoint a committee to draft a suitable definition for patent and proprietary medicines

Secretary and Treasurer M N Ford, of Ohio, presented his report as follows

THE REPORT OF THE SECRETARY-TREASURER

BY M N FORD

Since the last annual meeting of the Conference of Pharmaceutical Law Enforcement Officials, your chairman, Mr Swain and the secretary, have had numerous requests for information regarding enforcement of pharmaceutical laws and to each request we have lent all possible aid

On December 17, 1932, upon the request of Chairman Swain we sent a letter to each Secretary of every State Board of Pharmacy as well as other departments having to do with pharmaceutical law enforcement, with regard to the sale of drugs and medicines by vending or slot machines From the response that we had, it seems the letter was very timely in that a number of states have sought opinions and amendments to the law that would bar the distribution of drugs and medicines through vending machines

On January 31 1933 Chairman Swain also directed me to send a letter to all State Boards of Pharmacy, as well as other state departments having to do with pharmaceutical law enforcement the letter dealing with amending the pharmacy laws to use the term packaged medicines" in preference to the term ' patent or proprietary medicines ' The fact that the exemption clause of the law permitting the sale of patent or proprietary medicines by general dealers is sufficiently broad we should exert every energy to see that the law is not changed to grant further exceptions

We received numerous acknowledgments of receipt of this letter and assurance that no such legislation proposed would be sanctioned by enforcement officials

The report of our last annual conference as you know, appeared in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION in the December issue and contained thirty one pages of printed matter, and on February 17th, we obtained 300 reprints of the proceedings which were mailed out as first class mail, to the members of the Boards of Pharmacy as well as others interested in pharmaceutical law enforcement

On February 21st we wrote to all the secretaries of the State Boards of Pharmacy, as well as other pharmaceutical law enforcement officials regarding the annual five dollar contribution to the Conference This request was followed up by a letter on June 8th, and up to this time the following 25 states have contributed the usual five dollar fee I list the states in the order in which the fees were received

Ohio Indiana North Dakota, Kentucky Colorado, New Jersey Iowa, Georgia West Virginia New York Alabama Maryland Pennsylvania Arkansas Michigan Delaware New Mexico, Kansas Vermont Oregon, Florida Idaho South Dakota Minnesota and Wisconsin

In addition to those already contributing we have had acknowledgments from some of the States stating their contributions would follow a little later on

FINANCES

Receipts

Balance on Hand		$243 94
Receipts from 25 states at $5 00 each		125 00
		$368 94

Disbursements

12/29/32 to L A Engel, letter heads and reprints	$ 7 50	
2/17/33 Postage for Secretary's office	50 00	
3/18/33 to JOURNAL A PH A printing proceedings	115 77	
8/15/33 to Dr R P Fischelis for work on Synonyms report	25 00	
Total Disbursements	$198 27	
Total Cash Balance		$170 67

Upon motion of Mr Milne seconded by Mr Costello, the report was approved

Upon motion of Mr Childs, seconded by Mr F C A Schaefer, the Chairman was to appoint a Finance Committee of five to provide for the finances of the Conference in the future

At this time the Chairman called upon Secretary Kelly of the AMERICAN PHARMACEUTICAL ASSOCIATION and his remarks concerning the Conference were very encouraging and greatly appreciated

Chairman Swain next called upon Walter F Meads of Iowa for a paper upon "The Value of Annual Renewal of Pharmacists' Certificates in the Enforcement of Pharmacy Laws" The paper was received and discussed by Messrs Fischelis Pierce, Henry, Hankins and Swain

THE VALUE OF ANNUAL RENEWAL OF PHARMACISTS' CERTIFICATES IN THE ENFORCEMENT OF PHARMACY LAWS

BY WALTER F MEADS

In presenting this paper at this session of the Conference of Law Enforcement Officials I will attempt to show you the analogy between the annual renewal of the pharmacists' license and law enforcement How in the State of Iowa with whose workings I am most familiar, the enforcing of laws governing the practice of pharmacy is dependent on, or closely allied to the renewal of certificates

In 1880 the first pharmacy law was enacted in Iowa It provided regulations for the sale and distribution of drugs and medicines, as well as for the establishment of a commission of pharmacy, which was given authority to administer the affairs of the profession This included the enforcement of the laws governing the practice of pharmacy and the licensing of pharmacists by examination

In order to place the profession and the distribution of drugs and poisons under State regulation, with its added protection to the druggists and to public health, it was agreed by the pharmacists that the expenses of the department and of the law enforcement would be paid through the collection of license fees and the annual renewal of certificates That this was a wise agreement can be shown by the benefits accruing from the annual renewal of certificates

The greatest value of the annual renewal is perhaps that it provides funds for law enforcement which might be obtained if the Board was dependent entirely upon funds raised by a general taxation While it is true that the money we collect is paid into the State Treasury and an appropriation must be made by the legislature for our expenses, the fact that the Board is more than self sustaining is a valuable argument when requesting funds for the operation of the department This has also been a valuable argument, when on several occasions the pharmacy board has been faced with consolidation The fees are largely responsible, I believe for the fact that we have always been independent and have held the administration and enforcement of the pharmacy laws in the hands of members of the profession, the value of this independence can be appreciated by all of us here

It was the provision of the annual renewal and its ensuing independence that placed the

pharmacists in Iowa in the position of being able to secure in 1885, a law governing Itinerant Vendors of Medicine, requiring an annual license fee This law is still in effect and enforced by the Iowa Pharmacy Board We have been very fortunate in retaining the administration of this law, for such regulations are best enforced by those who are directly interested We have not only given our own druggists protection from this type of competition, but have added considerable to our prestige, by turning back to the State General Fund the sum of $20,000 to $40,000 a year Over the period of years the grand total above expenses is something over $900,000

The annual renewal of certificates is of assistance to us in law enforcement, in that the information requested on the renewal application blank gives us a record of the pharmacist which can be obtained otherwise only by personal contact This application when returned with the fee for renewal, gives the location of the pharmacist, whether active in retail drug business or not, and if active whether it be as proprietor manager or clerk, as well as the name of the firm where he is practicing Some states have sufficient inspectors to call in all stores several times a year, but we are not so fortunate in this respect Through our renewal we check by mail as it were, the things an inspector would learn through a visit to the store as our files are our check when any violations are reported relative to the supervision of licensed pharmacists in drug stores It is our policy as a rule, to send out each year with the renewal receipts, notices of changes in laws, reports or request for cooperation along the line of law enforcement This has brought big returns in interest and a closer contact with the druggists over the state Through this closer touch, they feel that the work of the Pharmacy Board including law enforcement, is part of their own personal responsibility Other states can and do send out material of this nature, but the renewal is an easy and natural way to handle this type of work which is one of the duties of the Pharmacy Board

In the inspection of drug stores the work is facilitated by renewal receipt card, which in Iowa must be on display along with the original license The inspector can tell at a glance whether the certificate is in good standing and if not a check is made to ascertain whether the owner is active in the store, or the reason for failure to renew the license

I hope I have successfully pointed out to you why we in Iowa feel that the annual renewal of certificates is of considerable value in the enforcement of the laws coming within the jurisdiction of the Pharmacy Board To sum up *first*, because it brings in funds not raised by general taxation, with which to best administer the pharmacy laws in the interest of public health and the profession *Second* because through annual renewals it is possible to keep in closer contact with the pharmacists, thus we have the opportunity to give as well as receive information relative to law enforcement *Third*, the establishment of a feeling of cooperation by regular contact between the department and the licensed pharmacist over the state

Dr R P Fischelis next presented his paper on "A Legislative Attempt to Establish Prescription Tolerances" The paper was discussed by Messrs Meads, Durham, Hayman and Hugo Schaefer

A LEGISLATIVE ATTEMPT TO ESTABLISH PRESCRIPTION TOLERANCES

BY ROBERT P FISCHELIS

A law recently passed in New Jersey and known as Chapter 309, P L 1933, regulates the compounding of prescriptions Its principal provisions are as follows

(1) It is made unlawful for any person who is not a registered pharmacist to compound, dispense, fill or sell prescriptions of licensed physicians, dentists, veterinarians or any other licensed medical practitioner

(2) Apprentices employed in a pharmacy may compound, dispense, fill or sell prescriptions of licensed physicians, dentists, veterinarians or any other licensed medical practitioner under the immediate personal supervision of a registered pharmacist.

(3) A prescription is an order for drugs or medicines or combinations or mixtures thereof, written or signed by a duly licensed physician dentist, veterinarian or other licensed medical practitioner

(4) Prescriptions of licensed physicians, dentists, veterinarians or other licensed medical practitioners transmitted by word of mouth, telephone, telegraph or other means of communication must be recorded in writing by the pharmacist, and the record so made constitutes the original prescription which must be filed as indicated below

(5) Every registered pharmacist compounding, dispensing, filling or selling a prescription must place the original written prescription or the prescription as recorded by the pharmacist, in case of telephoned, telegraphed or other communicated orders from practitioners, in a file kept for that purpose

(6) The registered pharmacist must affix to the container of every prescription dispensed a label bearing the name and address of the pharmacist, the date on which the prescription was compounded and an identifying number under which the prescription is recorded in his files The label must also bear the name of the licensed practitioner writing or communicating the prescription and the directions for the use of the prescription by the patient, as directed by the licensed prescriber

(7) It is a violation of the Act if a prescription is found to contain more or less than the quantity of the several or combined ingredients ordered by the prescriber

(8) It is a violation of this Act if the prescription contains ingredients other than those ordered in writing by the prescriber The addition of such inert ingredients as are required in the art of compounding is permissible when such ingredients are not used in any manner to replace the several or combined constituents ordered by the prescriber No replacements can be made without the prescriber s permission

The final weight or volume of a prescription must not be more or less than the original prescription calls for The quantities of individual ingredients must not deviate from the weights or volumes prescribed A reasonable tolerance may be permitted to account for manipulative procedures and normal variations due to unaccountability for accurate weighing and measuring and for the use of drugs of standard strength as well as for strict accuracy in all operations involving subdivision of bulk quantities into the individual doses prescribed "Eye measurements' in subdividing capsules powders and similar dosage forms are not to be relied upon in place of accurate weighing and measuring devices

(9) The Board of Pharmacy has the power to make rules and regulations for the enforcement of this act and is authorized to establish tolerances to allow for deviations from the amounts of ingredients prescribed due to manipulative procedure or deterioration

(10) All violations of this act are punishable by penalties ranging from a minimum of $25 for the first offense to $100 for third and subsequent offenses

We believe this to be the first State law which specifically grants authority to a Board of Pharmacy to establish tolerances for prescription work

Rowland Jones, of South Dakota, next presented a paper on "What Privileges Should Be Granted the Unregistered Dealer under the Pharmacy Laws?' The paper was received and discussed by Messrs Fischelis, Monias, Wilson, McCullough and Philip

WHAT PRIVILEGES SHOULD BE GRANTED THE UNREGISTERED DEALER UNDER THE PHARMACY LAWS?

BY ROWLAND JONES JR

The question of what privileges should be granted unregistered dealers under the pharmacy laws is indeed an important and vexatious one The pharmacy laws of the forty eight states differ in wide range in the treatment of this problem Examination of pharmacy laws of the various states indicate that we have an almost complete absence of uniformity in the methods evolved in the treatment of the evils these laws were designed to mitigate The laws of the several states extend in scope from almost complete freedom from restraint of the unregistered dealer, as embodied in the six- and ten mile qualifications in some states to rigid restriction on nearly all drug products in others

For the reason that my experience in pharmacy law enforcement and the development of changes in pharmacy laws in genera has been limited to a strictly agricultural area in which comparatively long distances separate registered pharmacies, I shall treat the subject in the light of such experience and depend upon subsequent discussion by the group to develop the phases of the problems as they exist in more thickly settled and in urban districts

In South Dakota the evolution of the pharmacy laws since statehood was attained in 1888 has been confined to the last six years As in many states the territorial pharmacy law which was usually written by pharmacists, was carried into the statutes subsequent to admission

to the union This law was drawn in such a manner as to definitely restrict practically all drugs and medicinal preparations to the pharmacist It is regrettable that during this period of rugged individualism, which now seems definitely on the wane, the opinions arising therefrom were reflected in the decisions of the courts of the states in such manner that the law was emasculated by the 'original package" decisions as was the case in many states There can be no questions that these decisions made by courts, to whom the merest whisper of monopoly was abhorrent, resulted in enormous diversion in the sale of drug products into channels foreign to pharmacy It is also true that these decisions which left glaring defects in pharmacy laws generally resulted in strong efforts to correct some of the evils arising therefrom Such efforts have met with varying success in the different states

In South Dakota in 1927, a case was carried to the state supreme court upon the question of the constitutionality of the pharmacy law controlling the sale of patent and proprietary medicines in original packages which resulted in what we know as the Wood's Decision This decision held that a section of the pharmacy law was unconstitutional in its restriction of the sale of patent and proprietary medicines in original packages to the pharmacist This decision immediately resulted in a great deal of confusion and difficulty in the administration of the law by the Board of Pharmacy for the reason that the average mind of the layman seemed unable to differentiate between patent and non patent preparations and between poisonous and non poisonous proprietary preparations Cases were lost which involved the sale of U S P and of poisonous preparations through the erroneous applications of the original package' formula laid down by the Supreme court This condition became so serious that it became necessary to go to the legislature for relief

As a result a patent and proprietary medicine license law was enacted early in 1933 without difficulty This law was in the form of an amendment to that section of the law declared unconstitutional in the Wood's case and had the effect of curing the constitutional defect but which at the same time regained the elements which had been indirectly lost The amendment provided that any merchant operating an established place of business (eliminating itinerant vendors) might apply to the Board of Pharmacy for a license to sell patent and proprietary medicines The fee of $3 is retained by the Board for the purposes of inspection and general pharmacy law enforcement In this amendment we defined patent and proprietary medicines as follows any medicine or drug which is prepared or compounded in proprietary form and sold in original packages, where the sale thereof is *unregulated under the laws of the state* " Thereby, in one step we eliminated the decision of the supreme court in the Wood's case as a precedent for the reason that we cured the defect in the law as pointed out in that decision and at the same time, brought the sale of these products back under our control This definition, which had had no existence in statute before this time, resulted in a clarification of the statute on the dividing line between patent and proprietary medicines on the one hand, and U S P and poisonous preparations on the other, the latter classification being adequately covered in the original law Therefore U S P drugs and preparations and poisonous products may not be sold in other than registered pharmacies in South Dakota We do not feel that any privilege whatsoever should be granted to unregistered dealers in these classifications

Another result which has been advantageous in the enforcement of the pharmacy laws is the provision for the cancellation of the patent and proprietary licenses upon evidence of law violation This gives the Board of Pharmacy a potent weapon in the fight for restrictions on the sale of drugs and medicines

At the time when this legislation was being considered it was said by some that such a license would result in great multiplication of the outlets handling patent and proprietary preparations The fact, as now established, is that a large number of small dealers such as restaurants, filling stations, billiard parlors, hardware dealers and grocers, who in the past have carried small stocks of these preparations have discontinued the sale of these rather than take out the license In many places no licenses have been applied for while in the smaller towns without pharmaceutical service the license has resulted in a quieting of the demand for more privileges for the unregistered dealer which is a force to be reckoned with at every session of the legislature

As for the six- and ten-mile laws which have been passed in some states, I hold the opinion that this is bad law from the standpoint of pharmacy From the standpoint of public health no differentiation in restrictions on this basis is even reasonable, and surely the public in the communi

ties affected will lose sight of the importance of adequate pharmaceutical service Also the prospective student of pharmacy will not be encouraged by the picture presented under such a system

During the past ten years we have witnessed a gradual but distinct retrogression in the statutory protection of the field of pharmacy, mainly through judicial decisions, and during the same period we have advanced rapidly in educational facilities and requirements for the pharmacist If this retrogression continues to such an extent that legal protection on U S P drugs and preparations and poisons is lost as we have lost the protection in the patent and proprietary field, I feel grave concern as to our ability to maintain pharmacy at its present high level

I believe, that as pharmacy law enforcement officials, it behooves us to oppose to the limit further modification of pharmacy law restrictions and to work toward licensing restrictions upon sales of drug products through other outlets While in South Dakota, we were forced to accept a license fee of only $3 for the patent license, I believe that such license should be much higher It would seem from the taxation standpoint, that the license for the sale of patent medicines should be at least as high as that required for the sale of non intoxicating beverages

Where funds for law enforcement are needed by Boards of Pharmacy, license fees should be allocated directly to the Boards for this work Where funds are ample such license fee may be advanced as a source of tax income to the state which is badly needed in most states Needless to say, the latter course offers a valuable lever in a successful legislative campaign

The sale of biological products presents a problem, particularly in parts of the country where the treatment of veterinary diseases provides a lucrative source of income for the pharmacist In many states such products are freely sold without restriction and even in some cases by itinerant vendors The proper storage and handling of biological products and their intelligent dispensing is important Biologicals for veterinary use have a definite public health relation Ignorant use of biologicals constitutes a menace if handled without benefit of expert knowledge Most pharmacy laws define drugs and medicines using the term "for man or for animal" With this in mind we have ample ground for insisting that the sale of veterinary biologicals by other than licensed veterinarians be restricted to the pharmacist For example, the average uninformed storekeeper should not have the privilege of keeping for sale anthrax live spore vaccine

In the field of insecticides and fungicides it seems evident, that we as pharmacists cannot hope to control the general sale of such products which have become staple articles of commerce I believe, however, that such sales by unregistered dealers should be accompanied by such regulations as license, registration of sales labeling, etc The pharmacist who will keep himself informed upon the technical aspects of this rapidly growing field, need have little fear from competitive outlets

This paper is possibly misnamed It should be 'What Privileges Should *Not* Be Granted Unregistered Dealers" It is my contention that no privileges, with the exception of those herein discussed, should be granted in any case without a strenuous fight If the sale of drugs which have been termed "simple household medicines" by those seeking to undermine pharmacy statutes, is allowed by unregistered dealers, it will only serve as an entering wedge and such action will be made a basis and a precedent for further encroachments

U S P drugs and preparations have always been and are now strictly within the field of pharmacy as have been poisons, with the exceptions heretofore noted Let us be prepared to fight for that which is rightfully within the province of pharmacy and not grant privileges to laymen the demand for which has so greatly increased due to the stringency of economic conditions Without strict statutory protection, pharmacy as we know it and as we dream it for the future, cannot continue its logical progress The health of the nations needs this progress

Mr Mac Childs of Kansas next gave an address verbally on the 'Need for Strict Enforcement of Law," in which he suggested the Conference follow the method of the N A B P as to model laws for enforcement The subject was discussed by Messrs Meads, Judisch, Fischelis Durham, Swain and Henry An excerpt follows

THE NEED FOR STRICT ENFORCEMENT OF THE LAW

BY MAC CHILDS

"My speech is going to be a series of recommendations rather than the discussion assigned The National Association Boards of Pharmacy was the conceived idea of several gentlemen and has

done great work It has served its purpose admirably and I think in the next five years will complete what it set out to do, and I hope it will be of greater help to the different parts of the organization which wish to make their laws more stringent and more useful Each of us have ideas that should constitute our laws but the trouble is that we have local ideas and we usually have a local law I have found that in cases of court that the citing of a precedent established in another state is a very great help in clinching the case as the judge and jury usually use the precedent set I might say that I have also found out that the enforcement must be tempered and not too strict as it is primarily for the protection of the public and of course it reverts back very favorably to the pharmacists

"At one time, three years ago, I was Secretary of our Board and thought maybe we had better 'clean-up our own back yard' first We made an inspection of every drug store in Kansas and we notified druggists as to where they were making a violation and notified them that the inspectors would call on them in two or three weeks We requested them to send in a notice to the Secretary of the Board that this violation had been eliminated and it would not be continued Of course, in a great many instances we found that their reply was just like the advertising of many patent medicines it was baloney ' In some cases warrants were sworn out and we received 100% convictions We do not believe convictions are the way to handle this, but with certain people this is necessary After 'the clean-up in our own back yard' we had very little trouble with others We treated everybody alike I was condemned a lot at first and lost many of my friends, who thought I was picking on them After they found they were receiving the same treatment as anyone else they have become my very good friends again and have given me much help We made some mistakes in our law enforcement by trying to be over zealous We tried to stop the sale of paregoric by unregistered pharmacists and only by prescription of physicians We, later, found out that there was a legal use for a 2 oz bottle of paregoric and found that we had made a mistake in allowing it to be sold only by a physician's prescription, as we had given them something these should not have left our control "

The speaker also described how they handled their court cases and said they did not even take a case into court unless they were positive they could get a conviction on it They usually got an opinion from the Attorney General and had this opinion read in the court the case was being tried or else had an Asst Attorney General present He also said that to have the proper evidence that prescriptions were being filled by a person not under the direct supervision of a registered pharmacist it was necessary that the inspector catch him in the act and actually see that this was done or else the evidence would not stand up in court

Hugo H Schaefer, in the absence of Mr Mather, presented the subject, 'Restricting the Practice of Pharmacy to Proper Persons " The subject was then discussed by different members, until 12 15 when the Conference adjourned

Thursday, August 31, 1933

At eight P M a joint session was held in the Pompeian Room with the Section on Education and Legislation The joint session was well attended and it was urged the annual joint sessions be continued

Friday, September 1, 1933

The Conference convened at 2 00 P M in the Colonial Room with the following present Messrs Fischelis of New Jersey, Costello of North Dakota, Mr and Mrs Bruce Philip of California, Henry, Durham and Borniac of Michigan Heine of Texas Hugo H Schaefer and F C A Schaefer of New York, Monias of Illinois King and Milne of Kansas, Teeters of Iowa, Rothrock of Indiana, Swain of Maryland, King and Ford of Ohio

Chairman Swain asked for the presentation of the paper of Mr Woodside of Pennsylvania on the subject "A Change in the Law Enforcement Procedure in Pennsylvania " In the absence of Mr Woodside, the paper was presented by Hugo H Schaefer of New York Upon motion of Mr Henry seconded by Mr Schaefer, the paper was accepted and discussed

A NEW SYSTEM OF LAW ENFORCEMENT IN PENNSYLVANIA

BY JOHN M WOODSIDE *

New deals in governmental procedure are so common at present that it seemed reasonable to expect, in some states at least, a change in the manner of enforcing the pharmacy laws

* Enforcement executive, Pennsylvania Board of Pharmacy

When changes have taken place they have been due to one of two reasons, either dissatis faction with the former system or they were prompted by an economic situation

No administrative agency is free of criticism of its enforcement of laws coming within its jurisdiction and no new system will eliminate this entirely for no law beginning with the Ten Commandments inscribed on the tables of stone by Moses have been enforced to the satisfaction of every one

In Pennsylvania the Board has had the usual amount of dissatisfaction but the change in the manner of enforcing the Pharmacy Laws was brought about through an economic reason The change did not originate with the Board but was instigated within the Department of Public Instruction in which the Board of Pharmacy and all other professional Boards are units Previous to September 1932, the Board of Pharmacy was allotted two agents who devoted all of their time to investigation work for it All the other professional groups were allotted special agents

There were times, of course when a complaint or other matter which required investigation, would be received by two or possibly three professional boards from the same territory at or near the same time Each Board would dispatch its own agent Each Board was allotted a given amount of money for law enforcement by the legislature each biennium and the expense thus incurred was paid out of its funds set aside for it

The Department believed that some system should be devised that would eliminate this duplication of expense This was brought about by the creation of the Law Enforcement Bureau within the Department and all agents were merged under the unified control of this bureau Agents are no longer attached to a particular Board but are now classified as agents of the De partment of Public Instruction The expense incurred by the agents is paid out of the adminis trative fund

The state is divided into districts and each inspector assigned a given district in which he makes all investigation regardless of character The investigations include those for the Board of Pharmacy Medical Licensure Dental Undertakers Engineers Accounting, Architects, Op tometry Barbers etc

Complaints are sent to the Bureau which distributes them to the agents Reports of all investigations are sent to the respective Boards and to the bureau The prosecutions are con ducted by the bureau but only when advised by the Board that this is warranted No action is taken against an individual until after the matter has first been considered by the Board or its en forcement executive

The Board does not believe that this system is perfect at the present time but believes it is capable of improvement From an economical standpoint it is based upon sound reasoning

When first proposed the Boards administering the laws applying to all Healing Arts, en deavored to have a separate unit to be known as the Medical Arts Unit, allotted for their par ticular use but were unsuccessful At the present time ten agents are employed by the Depart ment and as a part of their time is given to the work of the Board of Pharmacy it has enabled the Board to increase the scope of its field work

The work, naturally, has not always been satisfactory With men untrained in the work, it does not seem reasonable to expect that it would be During the year in which the system has been in force, there has been distinct improvement Some agents have of course grasped the work more quickly than others and perform more satisfactorily

The principal criticism which reaches the Board from the drug trade is that the agents are not pharmacists It is true they are not with one exception, one of the Board's special agents being a pharmacist I presume that barbers accountants engineers, etc respectively make com plaints of a similar character

The Pennsylvania Board is interested in this question regarding the employment of phar macist investigators by the Boards in other states It does not, of course have control over the employment of the agents at the present time One of its finest agents who has been in its employ for almost fifteen years is not a pharmacist

It is true that in some states the Board of Pharmacy does not enforce the Pharmacy Laws I understand it does not in the District of Columbia and in many states the services of a detective agency is frequently employed I believe, too that there are some members of Boards of Phar macy who believe the Board should be relieved of that duty In a survey taken in a southern

state recently, it was recommended that the enforcement should be entrusted to the Department of Agriculture, and that investigations should be made by its agents

Possibly the most striking example of non-technical supervision which might be cited in support of the employment of non-pharmacist agents is that which is required by the Federal Constitution viz , that the secretary of the Army and Navy be civilians More recently, should it not be mentioned that at present the entire business structure of the nation, from the largest to the smallest, is under the supervision of an Army General

In both of these instances the responsible administrator is surrounded with technical advisers The situation under the Pennsylvania system as it applies to the Law enforcement in which we are interested is quite the reverse, the agent being required to secure the information and forward it to the Board which is composed of technically qualified persons

In the absence of Mr Parr the subject of Law Enforcement in Michigan" was discussed by Mr Henry of Michigan

At this time, the Chairman appointed a nominating committee consisting of R P Fischelis, *Chairman*, Mr Costello and Mr Heine

Dr Fischelis of New Jersey spoke upon the ' Importance of Synonyms in the Enforcement of Drug Standards and Their Relationship to the Enforcement of Pharmacy Laws " He recommended that the Conference reaffirm their stand on synonyms to the U S P Revision Committee Upon motion of Mr Henry seconded by Mr Durham the recommendations of Dr Fischelis were passed on to the U S P Revision Committee for inclusion in the new revision

The following resolution was presented to the Conference

> *Resolved* That the N A B P request the Conference of Pharmaceutical Law Enforcement Officials to determine ways and means of providing more adequately for the protection of the public in safeguarding all functions that have to do with prescription service from the time a prescription is written for a patient to the ultimate delivery of the finished medicine, so as to assure a continuity of adequate supervision in this important health function

It was moved by Dr Fischelis, seconded by Mr Schaefer, that the Chairman appoint a Committee to study the resolution and report The question was discussed by Messrs Henry, Schaefer, Fischelis and Swain and adopted

Chairman Swain next referred to the proposed amendment to the National Foods and Drug Act and Narcotic Legislation, it was discussed by Messrs Henry, A H King and H Schaefer

The subject of the Proper Enforcement of Fair Practice Codes for the Drug Industry under the NRA," was discussed by Messrs Swain Schaefer and Heine

The Nominating Committee at this time made the following report For *Chairman*, R L Swain of Maryland, *Secretary and Treasurer* M N Ford of Ohio, for *Delegate to the House of Delegates*, F C A Schaefer of New York Upon motion of Mr King seconded by Mr Henry, the report was adopted and the officers declared elected by unanimous vote

Upon motion, duly seconded, the Conference adjourned

R L Swain, *Chairman* M N Ford *Secretary-Treasurer*

COMMITTEES OF THE CONFERENCE OF PHARMACEUTICAL LAW ENFORCEMENT OFFICIALS

Chairman R L Swain has appointed the following committees of the Conference of Pharmaceutical Law Enforcement officials Finance, *Chairman*, Frederick C A Schaefer, New York, Rowland Jones, South Dakota, Wesley MacChilds, Kansas, S M Hankins, Florida, Hugo H Schaefer New York, Committee to accurately define the terms, "patent medicine" and "proprietary medicine " *Chairman* A L I Winne Virginia, George W Mather, New York, John M Woodside, Pennsylvania M N Ford Ohio, R P Fischelis New Jersey, Robert L Swain, Maryland

A LEGISLATIVE REPORT

Presented by Fayetta H Philip in the House of Delegates, A PH A as a minority report [1]

"To A V Burdine, *Chairman*

'In presenting this minority report I am not disagreeing with the majority report of the chairman of the Committee, except to this extent That the report dealt wholly with the work of those outside of our appointed committee and not of the committee's work, while mine deals with actual work of at least one member of the Committee

In the first place my appointment to the Committee was made at the time that I was engaged in securing for the drug stores of the United States an exemption ruling from the Tax Division of the Government It was the day of the Ground Breaking Ceremony for the Institute of Pharmacy Building in Washington, D C, that I was shown an article in a *Drug Journal*, which stated that prescriptions which contained certain ingredients would be taxed under the new excise tax laws

'Even though I was told that it was too late to change the ruling, I said it is never too late to right a wrong, and that as I saw the privileges of my profession, they were beyond the tax laws Briefly stated the arguments were, that when a physician wrote a prescription, its ingredients could not be divulged to his patient, nor separated out for taxing

Fellow druggists, the horrors that stared the profession of pharmacy in the face appalled me I can conceive of no ruling that would have caused more worry to pharmacists Within an hour I dispatched a letter to the Department and organized a force to combat the evil Within three days the danger was past although it was about three months before the red tape of the Government machinery unwound sufficiently that the druggists were officially notified that there would be no tax on prescriptions

The personnel who accompanied me to the offices of the proper Government officials were, W Bruce Philip Robert L Swain, Samuel L Hilton, Dr Simmons, C F Kelly and C P Frailey

It was not a simple thing I assure you, but suffice it to say that in the nick of time our protest was entered and justice was secured

A RETAIL DRUG CODE

"There are several important things concerning the Retail Druggist Code, that it is meet that this gathering of pharmacists should be informed about

'For three days, in August 1933, a general retailer's code was argued before Administrator Whiteside, in Washington At the end of the session a Code was written which the proper representative of the respective industries signed I, as your representative, sat through the session and was conversant with the rules that were given to be followed in drawing up our own Code I am sorry to report that during much of the time I was the only druggist present The lack of active participation by druggists in the activities which vitally concern them surprised me

"There are sixty odd thousand retail druggists in the United States and right now every one of them should be awake to the opportunities and dangers of the situation Never was it more important for them to be organized and individually awake Men and women of the profession this is no mere committee report, this is a stirring appeal to rouse you You can go around and pat yourselves on the back, because the President of the United States exempted professional pharmacists from the labor provisions of the Code, but that won't get you anywhere except perhaps, in your own estimation

"The profession of pharmacy is practiced by those who are skilled in the art, and by those who use it as a trade It does not in any way tear down the profession of pharmacy in admitting that those who practice it work certain hours in a drug store, but it does bruise its sensibilities to have the younger generation of pharmacists rant in public about their rights On one hand there is the fact that the greater number of pharmacists are clerks, while on the other the smaller number are proprietors Each is interested in the lives of the citizens of the nation and for long hours and short pay serve behind drug counters seven days in each week Can these facts be ignored? Why should they be?

[1] See Report of Committee on Legislation page 1047, October JOURNAL

"No one was in a better position perhaps than I was to present definite statistics as to what had already been done to uphold working hours in pharmacy and I beg leave to show you the background that I worked from In California in 1910 a very rigid eight-hour law for women was enacted Physicians and professional women were exempted from its rulings Trained nurses in hospitals desired to be exempted and presented a test case Unfortunately a woman pharmacist, Miss Ethel E Nelson Merrit Hospital in Oakland was the person used to try to break the 8 hour law The case was lost in both the local courts and in the Supreme Court of the United States

Nevertheless women pharmacists in California working in drug stores were being considered by the Labor Commissioner as professional women and not to be under the 8 hour labor law, unless they were working in dispensaries in hospitals Otherwise they were considered under the 9 hour pharmacy law which the drug clerks had enacted

"It is necessary to tell that the 9 hour law made by drug clerks had been broken down in a test case, prosecuted by the Druggists Association of Southern California in conjunction with the California Pharmaceutical Association but also I must say that there were places where it would still be applicable Therefore every class of druggists was active in sponsoring a new law It was just at this critical stage of affairs that a woman pharmacist who was working over eight hours on the prescription and drug counters of the most ethical prescription drug store in San Francisco was arrested for working over eight hours

'At a conference with a new Labor Commissioner he stated that even though his predecessor had considered women pharmacists outside the Eight Hour Labor Law still he would not make such a ruling however he said that he would hold the case in abeyance until we women pharmacists could be declared under the pharmacy law

' When the legislature was to convene and acts relative to the Eight-Hour Law were to be introduced, I was chairman of the Legislative Committee of the California Pharmaceutical Association I rewrote the law and I went to Sacramento and after five weeks of battle enacted the present pharmacy law, which allows any pharmacist man or woman, to work 128 hours in any two consecutive weeks but to work only on thirteen days in such two weeks, etc

It was some ten or twelve years ago that the California law was enacted and after organized union labor had fought the passage of the bill every step of the way Thereafter, at each session of the legislature they tried to include women pharmacists in a general labor law Finally the Attorney General made a very definite ruling upon the subject I will couch it only in layman's words, which were to the effect that when the Legislature through its two respective bodies of representatives enacted a law regarding women pharmacists they intended and did classify them as professional and that a general law would not affect them The written ruling is a treasured possession of the Women—the Women s Pharmaceutical Association of the Pacific Coast

'Recently, at the Code hearings when the drug clerks of New York, Baltimore and other places said such disparaging things about pharmacy as a profession I defended it by presenting the wording of the California law which law has been acceptable and workable to both the professional and commercial interests In its enforcement pharmacy and pharmacists were adjudged professional by the highest of law authorities in California "

THE WORLD'S FAIR AT CHICAGO IN 1934

Tile and Till for March has an interesting story of Pharmacy's part at the Century of Progress and its management ably carried on under the direction of Chairman H C Christensen Secretary Frank B Kirby and Miss Esther Barney, who had charge of the exhibit Pharmacy's exhibit will be continued with the reopening of the Fair, on June 1st introducing a new color scheme greatly enlarged and varied new lighting effects and important rearrangement of the grounds to make room for new buildings and exhibits

---

Alf W Pauley was a speaker at the mass meeting of Chicago drugdom on March 20th George L Secord presided over the sessions

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1933–1934

Office of the Secretary 2215 Constitution Ave Washington, D C

LETTER NO 8

March 3, 1934

To the Members of the Council

45 Use of Text of N F V Motion No 11 (Council Letter No 6, page 158) has been carried and P Blackiston Son & Co Inc have been advised

46 Buckram Binding for N F VI Motion No 12 (Council Letter No 6) has been carried and the note executed as directed

47 Election of Members Motion No 13 (Council Letter No 6, page 160) has been carried and applicants numbered 75 to 131, inclusive, are declared elected

48 Time of the 1934 Meeting Motion No 14 (Council Letter No 7 page 160) has been carried unanimously and the attached circular was sent to the pharmaceutical press to the secretaries of state and national associations to the secretaries of boards of pharmacy to the deans of schools and colleges of pharmacy and to the officers of the sections and conferences Arrangements for the meeting and dedication are going forward rapidly

49 Report of Auditors The following has been submitted

February 3, 1934

Mr C W Holton Treasurer
AMERICAN PHARMACEUTICAL ASSOCIATION,
Baltimore Maryland

Dear Sir

I have made an examination of the books and accounts of the AMERICAN PHARMACEUTICAL ASSOCIATION and your report, as Treasurer for the calendar year 1933 and *I hereby certify* that the total cash and securities on hand at December 31 1933, amounting to $371 946 44 is correctly stated

During the year work on the National Headquarters Building in Washington was continued and $234,246 52 was expended from the Headquarters Building fund for this purpose increasing the cost of real estate owned by the ASSOCIATION to $457 205 46

All cash receipts have been traced to deposits in banks to the credit of respective funds for which received and all disbursements have been found evidenced by properly authorized voucher checks

Balances on deposit with the various banks have been reconciled with Certificates from the Depositories and Investment Securities held by the ASSOCIATION have been examined and found to be in agreement with the accounts shown by your report These securities stated in the amount of $140 400 00 are valued at par value as shown by the certificates

Interest accruing on bonds held by the various funds and trusts has been promptly collected on the due dates and deposited to the credit of the proper account

During the year 1933 certain U S Liberty Bonds held by the ASSOCIATION were called for redemption An examination and verification was made of all changes resulting from this

Records maintained by the Secretary of the ASSOCIATION have been examined and transfers of funds from his account to that of the Treasurer have been verified

Respectfully submitted

(Signed) W A JOHNSON,

52 Local Secretary for 1933–1934 The Local Committee on Arrangements for the coming meeting was selected by the District of Columbia Pharmaceutical Association Presi dent Paul Pearson and Secretary A F Gorsuch are serving as chairman and secretary, respectively, of the Committee

The Committee has recommended Mr F A Delgado as local secretary Mr Delgado is connected with the Department of Commerce and has been a regular attendant at A PH A meetings

F A Delgado is nominated by Kelly as local secretary If other members of the Council desire to submit nominations they are requested to do so promptly in order that a vote may be called for promptly

53 Headquarters for the 1934 Meeting The local Committee on Arrangements has recommended the Hotel Shoreham as headquarters The hotel is located on Connecticut Avenue out of the business district and has ample accommodations A special rate of $4 per day per person for single room and $3 per day per person for double rooms has been arranged all rooms with combination shower and bath

(*Motion No 17*) *It is moved by Kelly that the Hotel Shoreham be approved as headquarters for the 1934 meeting* A vote on this motion will be called for in about ten days

E F KELLY, *Secretary*

Eighty-second annual meeting of AMERICAN PHARMACEUTICAL ASSOCIATION and dedication of the American Institute of Pharmacy during week of May 7th See Transportation under department "Societies and Colleges"

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council"
—Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association"

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates"

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

CHICAGO

The monthly meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the University of Illinois College of Medicine, February 20 1934

Dr Mary Rising Professor of Chemistry, University of Chicago was introduced as the speaker of the evening Her subject was entitled Hypnotics"

Dr Rising introduced the subject of hypnotics by beginning with a short history of the changes during the years in the use of simple drugs up to the present day use of many of the complicated coal tar products

The production of procaine, which is far less toxic than cocaine, was cited as a triumph of the synthetic chemists

Hypnotics were described as drugs which produce sleep but do not relieve pain To day they are taking the place of narcotics to a great extent where only sleep is wanted

A discussion followed of many of the popular barbiturate derivatives and their structural formula was shown by lantern slides Mention was made of the possibilities of further research work on the barbiturates and what the chemists are striving for

After the very interesting presentation by Dr Rising Mr Morrison, head of the drug department of the University of Illinois Research Hospital, exhibited some prescription incompatabilities that he had encountered and suggested methods of overcoming them

LAWRENCE TEMPLETON, *Secretary*

NEW YORK

The February meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in the College of Pharmacy, Columbia University President Ballard was in the chair, and about fifty members and their guests attended

After the meeting had been called to order the report of the secretary was read and accepted

Due to the absence of Treasurer Currens his report was read Dr Bilhuber *Chairman* of the Audit Committee then reported that he had gone over the accounts with the *Treasurer*, and had found everything in order

Chairman Lehman, of the Committee on Education and Legislation, reported by letter that he had appointed Messrs Dyer and Dworkin to serve on his Committee

Chairman Kassner, of the Professional Relations Committee next reported the appointment of Messrs Gerstner and Frederick Lascoff as members of his Committee

Chairman George Simpson, of the Membership Committee, now reported the following appointments to his Committee Messrs Rauben heimer, Kidder Ligorio, Hutchins and Lippe Applications for Branch membership of the following were reported by Mr Simpson Edward Klar, Samuel Henkin, Jonathan Gordon Ralph Foran and Frank Hitchcock Mr Harry Stine's application for membership in the AMERICAN PHARMACEUTICAL ASSOCIATION was also submitted

Following a motion by Dr H V Arny, seconded by Dr Kassner, the applications for Branch membership were accepted and the applicants were voted in as members The application of Harry Stine was forwarded to Secretary Kelly

Chairman Dauer, of the Committee on the Progress of Pharmacy, reported the appointment of Messrs Kassner Schaefer Dyer, Wimmer and Kern to membership on his Committee

The president then announced the topic for the March meeting and for the April meeting and urged all present to attend

Following this President Ballard introduced the speaker for the evening, Mr Marshall G Meriam, who discussed the Manufacture of Clinical Thermometers The speaker was assisted by Mr Barthen, who demonstrated while Mr Meriam discussed the various steps in the manufacture of clinical thermometers

The speaker began his discussion by briefly reviewing the history of the clinical thermometer and also described some of the early types He then proceeded with a description of the manufacture of the glass tubing used in making thermometers Several of his exhibits showed clearly some of the intermediate stages in drawing out the glass The actual manufacture of a thermometer was then carried out by Mr Barthen while Mr Meriam carefully explained each step Of unusual interest was the projection on a screen of the constriction in a clinical thermometer This showed very clearly how the constriction operates The importance of aging thermometers before calibration was pointed out by the speaker The final calibrating of the finished thermometer was then described

Many practical hints for the use and sale of thermometers were included by Mr Meriam He carefully demonstrated the proper method for 'shaking down" and likewise explained the reasons for the various prices of thermometers

Many types and forms of clinical thermometers and cases were shown and Mr Barthen went through the manufacture of thermometers repeatedly until every one present had seen the delicate operations at close hand

At the completion of Mr Meriam's address a rising vote of thanks was accorded the speaker and his assistant, and the meeting was formally adjourned to give every one an opportunity to see the exhibits

RUDOLF O HAUCK *Secretary*

ANNOUNCEMENT OF APRIL MEETING

The meeting of New York Branch, A PH A , on April 9th will be held at 8 15 P M in the College of Pharmacy Columbia University, 115 W 68th St , New York City This meeting will be devoted entirely to a celebration of the 50th Anniversary of the National Formulary Plans at present call for the co operation of the Kings County Pharmaceutical Society and the Deutsches Apotheker Verein Persons prominently connected with the N F work will be present and it is hoped to have Dr Charles F Schleusner recount some reminiscences

RUDOLF O HAUCK, *Secretary*

NORTHERN NEW JERSEY

The February 19th meeting of the Northern New Jersey Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was one of the most interesting that we have had The regular routine of business was suspended by President Little and the members enjoyed two very good addresses, one by Mr Charles Nichols, on Pharmacy in the Near East, ' and the other by Doctor James C Munch on the new hormone ' Tissue Extract "

Mr Nichols the first speaker was born in the Near East and attended the American University of Beirut where he studied Pharmacy His introductory remarks were, therefore, devoted to a description of the university and the country surrounding it He then began the story of the life of a pharmacy student in that English speaking institution

In order to matriculate in the course in pharmacy, one must have already earned a B A degree or possess its equivalent in education The work is divided into three parts first a preliminary academic year preparatory to a year of practical work in a licensed pharmacy which is followed by another period of class and laboratory instruction

The student undergoes regular course examinations at the end of the first year He then sits in special oral examination with a commission from the Turkish Government before he is permitted to engage in the year of practical work This last inquisition is conducted either in French or Turkish according to the wish of the candidate The next serious examinations are the finals in his senior year

Upon graduation the student is presented with the degree of Master of Pharmacy by the

University and a diploma from His Majesty's Imperial Medical Science University These credentials take the place of a state board certificate and give their holders the right to practice pharmacy in any part of Turkey, Egypt and the Sudan

The pharmacist in the Near East," Mr Nichols said is ranked professionally with the physician and works in close harmony with the latter The pharmacies too, are truly pro fessional and strange as it may seem French is the language of the prescription

Doctor Munch next on the program began his talk on Tissue Extract ' with a demon stration of the variation taste with different individuals Mr Arnold Quici assisted in the experiment Doctor Munch then explained that Tissue Extract is the name which has been given to a hormone obtained from the pancreas, principally but also from other tissues and from the urine It appears that this hormone is elaborated in the pancreas passes into the circulation, is deposited in various organs (brain stem liver kidneys, etc) and is even tually excreted in the urine When the pan creas of an experimental animal is removed, there is a prompt decrease in the amount of the hormone in the urine or tissue

It is obtained in connection with extraction of insulin from pancreas on a commercial scale The ground pancreas is extracted with acid alcohol allowed to stand, neutralized and filtered The filtrate which contains both insulin and Tissue Extract is then concentrated, the fat removed, and the insulin precipitated out with ammonium sulphate at the isoelectric point The supernatant solution is concen trated *in vacuo*, insoluble material filtered off and the "Tissue Extract Concentrate ' is available for standardization and use After a series of intravenous injections of epi nephrine have been made in a surgically anes-thetized dog, a series of injections of Tissue Extract are given and the fall in blood pressure determined A mixture of known volumes of Tissue Extract and epinephrine is then in-jected until that proportion is determined which causes neither a rise nor a fall in blood pressure One unit has been considered to be that volume of Tissue Extract neutralizing the pressor ac tivity of 1 gamma (0 001 mg) of epinephrine Material used in research and in clinical studies contains 10 units per cc

The action of epinephrine has been neu-tralized in every method by which its action has been measured (blood pressure, blood sugar constricting tissues etc)

Clinically studies on about 500 patients with angina pectoris have shown that the course of treatment produced complete disappearance of the anginoid pains in 50 per cent, dis appearance during treatment in an additional 35 per cent, and no demonstrable effects in 15 per cent In treating about 100 cases of thrombo angiitis obliterans and endarteritis obliterans, about the same percentage of relief was observed Tissue Extract appears to be useful in treating vasomotor disturbances such as angina pectoris, Buerger's disease and inter mittent claudications

The addresses concluded, the Membership Committee nominated the following individuals for membership in the branch Anthony S Casabona, J Stanley Steiner and Raymond L Thatcher They were elected

A P Shenkel, Division Sales Manager for Sharp and Dohme spoke for a few minutes, after which the meeting was adjourned

L W Rising, *Secretary*

PITTSBURGH

The Pittsburgh Branch of the American Pharmaceutical Association met February 27, 1934, in the lecture room of the Falk Clinic Prof Clarence T Van Meter presided

An election of officers was held The follow ing will serve the Pittsburgh Branch for the 1934–1935 term

President, Raymond Hornfeck
Vice-President, John Ray Burrows
Secretary Frank S McGinnis
Delegate, C Leonard O'Connell

Doctors Leo H Criep and Ralph V Robin son, members of the teaching staff of the School of Medicine, University of Pittsburgh, ad dressed the group The following is a short abstract of the paper

' The United States spends on an average of about four hundred million dollars a year on patent medicines These products are fre quently not patented at all because the manufacturer cannot prove that they are either new or useful Furthermore, the formula would have to be disclosed, and this would rob the product of the very secrecy upon which the manufacturers depend for success of marketing the nostrum While the Pure Food and Drugs Act of 1906 was undoubtedly a step in the right direction, the law is sufficiently weak as to allow many loopholes and permit a great deal of quackery

"The agitation at the present time on the Tugwell Bill, or a modification thereof, should be supported by the medical and pharmaceutical professions Steps should be taken in the direction of curbing the unfair and fraudulent advertising going over the air daily Unless this is done soon we shall find that its harmful effects will, by far, exceed that of newspaper advertising

'It is to the credit of high grade pharmaceutical journals that they have always spoken against the frauds practiced by some patent medicine manufacturers For a great deal of this the medical profession is to blame, because it has helped to popularize various proprietary medicines The weakness of the courses of pharmacology and therapeutics in our medical schools to day is also an important factor

'A plea was made for closer cooperation between the medical and the pharmaceutical profession

Dr Ralph V Robinson presented Burke and Hare" in a very entertaining and informative manner His introductory remarks concerned the history of early medicine, and how schools of anatomy came into being He told of the life of Burke and Hare and the part they played in supply material for anatomical study Interesting lantern shades were used by Dr Robinson, for illustrating the escapades of the notorious characters, Burke and Hare"

FRANK S MCGINNIS, *Reporter*

ST JOHN'S UNIVERSITY COLLEGE OF PHARMACY, STUDENT BRANCH

Thirty students, several Alumni and members of the faculty attended a dinner in Brooklyn in honor of the institution of the St John's University, College of Pharmacy Student Branch of the A PH A Permission had been granted to proceed with the dinner pending the parent association Max Vogel, '34, president of the newly organized branch acted as toastmaster, the speakers were Professor John J Corcoran and Dr Otto Raubenheimer, other guests included Professor Vernon Brooks and Professor Frank Bulda

In his most enlightening and inspiring talk Dr Raubenheimer, the guest of honor, traced the history of the AMERICAN PHARMACEUTICAL ASSOCIATION and explained the work carried on by the organization He described the development of an American literature of pharmacy, specifically discussing the PROCEEDINGS, the YEAR BOOK, the JOURNAL, the National Formulary and the Recipe Book published by the ASSOCIATION The value of the work done by the Scientific Section, the Historical Section and the Section on Dispensing Pharmacy was also discussed by Dr Raubenheimer

Other officers of the newly formed branch are Herman J Steinberg, '34, *Vice President*, Bernard Meyerson, *Secretary*, and William McKaba '34 *Treasurer*

FIFTIETH ANNIVERSARY, TEMPLE UNIVERSITY

Temple University celebrated its fiftieth anniversary the week of February eleventh with many meetings and activities suitable to the occasion The college, founded by Russell H Conwell, author of the famous lecture Acres of Diamonds ' has grown in student enrollment from seven in 1884 to approximately twelve thousand in 1934 The property and equipment accumulated during this period is valued at about eight million dollars

The School of Pharmacy promoted an elaborate program which included displays demonstrations visitations and meetings of interest to pharmacists, physicians and dentists The Dean and Faculty entertained at dinner the delegates in attendance from other Schools of Pharmacy State Boards and Pharmaceutical and Drug Associations United States Senator Royal S Copeland delivered the principal address at this meeting, and at the Founder's Day graduation exercises he was the recipient of the honorary degree of Doctor of Science

Short speeches of congratulation and felicitation were made by J W Sturmer, Dean Phila College of Pharmacy representing the American Association of Colleges of Pharmacy R E Lee Williamson secretary, Federal Wholesale Druggists' Association, John M Woodside, member Penna State Board of Pharmacy, Robert P Fischelis, president-elect, AMERICAN PHARMACEUTICAL ASSOCIATION, W Bruce Philip, general counsel, N A R D , W Scott Taylor, Jr , president, New Jersey State Board of Pharmacy, Wilmer Krusen, president Philadelphia College of Pharmacy, Leo G Penn president, Philadelphia Association of Retail Druggists John C Walton, Executive Committee, Penna Pharmaceutical Association, Frank H Eby, president, Phila Branch, AMERICAN PHARMACEUTICAL ASSOCIATION, Charles H LaWall dean Philadelphia College of Phar

macy, Lloyd N Richardson, president Maryland Board of Pharmacy, John C Krantz, Jr, second vice president, Henry Brown, Executive Committee Penna Pharmaceutical Association, Charles T Pickett, secretary, Philadelphia Association Retail Druggists

Robert P Fischelis, president elect of the AMERICAN PHARMACEUTICAL ASSOCIATION made the principal talk at the Pharmacy convocation Wednesday afternoon

A large number of guests students and alumni listened to his scholarly paper Pharmacy in Our Changing Era ' Parts of the address follow

PHARMACY IN OUR CHANGING ERA

BY ROBERT P FISCHELIS

You must know the changing needs of humanity if you would succeed in life In business in your profession in your housekeeping, whatever your life that one thing is the secret of success You must first know the demand You must first know what people need, and then invest yourself where you are most needed Thus spoke Russell Conwell, the founder of this great University in his oft repeated lecture Acres of Diamonds "

At this convocation commemorating as it does the fiftieth anniversary of the beginning of Temple University and the thirty-third anniversary of the organization of its School of Pharmacy, it may profit us to spend a few minutes in contemplating the Conwell success formula as it applies to the field of endeavor in which we are engaged

How careful have we been to examine the changing needs of humanity with respect to pharmacy? Have we honestly and intelligently endeavored to ascertain what, among the things we have to offer, the people really need? Have we endeavored to invest ourselves where we are most needed? The answers to these questions will reveal how closely we have approached the standards of success as visualized by the founder of this University

We know that the demand for the type of pharmaceutical service which engaged the major part of the retail druggist s attention is no longer demanded to the extent that it was when Temple University organized its School of Pharmacy in 1901

Prescription work has not increased New and more complicated products have replaced the simple drugs in the physician's armamentarium The manufacturing function has been almost entirely eliminated from many of our retail drug stores This is partly due to the necessity for proper chemical and biological control of manufacturing processes or of finished products, which cannot be carried out in the ordinary drug store laboratory It is also partly due to the prohibition era, during which it was made difficult and in some instances impossible for pharmacists to obtain alcohol for manufacturing purposes without endless record-keeping and official red tape Nor was it possible to compete with large-scale producers who were able to obtain specially denatured alcohol in quantities at greatly reduced prices free from the revenue tax It was also partly due to the growing apathy on the part of pharmacists toward professional work, and their avidity for any kind of merchandising activity which would help to keep their establishments going at a profit

During this same period 'big business' entered the field of medicine Pharmaceutical manufacturing establishments of long standing became the playthings of financiers Advantage was taken of the fact that anybody can enter the medicine manufacturing business in all states of this Union without meeting any requirements as to scientific or professional training or moral character Our inadequate food and drug laws made it possible for individuals and corporations to grow wealthy at the expense of citizens who take it for granted that whatever anyone may print or say over the radio about a medicine is true Patent and proprietary medicines whose formulas are unrevealed were forced in constantly increasing numbers upon the pharmacist s shelves by the creation of a public demand through advertising of one kind or another and by high-pressure sales methods Manufacturers of these products set themselves up as authorities on the diagnosis and treatment of nearly all ailments to which the human flesh is heir, and with the increasing costs of properly regulated, scientific medical care, they found a fertile field among those who considered the taking of medicine an economical way to health in the full faith that their Government would permit no fraud in a field of such great importance to the public welfare Without question, these interests have made inroads upon the practice of medicine and pharmacy, with doubtful benefit at best and in many cases, with considerable detriment to the public health

Big business" also entered the retail drug

field It emphasized the merchandising possibilities of every commodity and every service ever offered in retail drug stores Many pharmacists, seeing the material success that attended the efforts of these organizations deemed it expedient and wise to follow the lead of the corporation stores In many instances this left the pharmacist of the old school far behind in the procession toward business success wondering how long he might be expected to survive but doing virtually nothing to determine whether the new developments were really filling a public need or whether they were merely a form of exploitation of a gullible and long suffering public

How many pharmacists are competent to pass upon the conflicting 'scientific' claims of the many hundred so called antiseptics cosmetics patent medicines and sundries which are offered an unsuspecting public as health aids with little or no scientific or even practical background? Here indeed we have a public need which the properly educated pharmacist can fill with profit to himself as well to his clientele The people want to know the truth about drugs They obtain exaggerated versions from certain popular literature but these versions are at least as truthful as the advertising which has placed the products criticized among the best sellers of the offerings of the drug store and they have the advantage of warning the public to be on its guard against possible and probable fraud With increasing doubt of the value of drugs engendered in the public mind, the people will listen to and honor a pharmacist who has the courage to tell the truth, based upon knowledge and facts

Ali Hafed—in the Conwell lecture Acres of Diamonds"—traveled thousands of miles from his home in search of diamonds He died in poverty, but the man who bought Ali Hafed's original farm soon discovered the most perfect diamonds in the garden of the home which Ali had left to wander afar in his ill fated search How true of Pharmacy! We wandered far afield in search of material success, and we have left uncovered the acres of diamonds lying in our back yard because we seem to be unable to apply the training and knowledge we have gained at great expense of time and effort to the simple task of finding the human need which we are able to fill

But, you say, even if we should cooperate more intimately with the medical and dental professions and become an acknowledged source of critical information on the efficiency and value of drug products would this not lessen rather than increase our income? Certainly we could not be expected to continue to sell the articles which science condemns

It is true that a fairly general acceptance of a program of this kind would curtail the sale of many products, but it would correspondingly increase the sale of those which are marketed purely on a basis of merit Pharmacists would no longer hesitate to express their convictions on health matters and they would rise in public esteem to the level of a true health profession The utilization of the professional services of pharmacists to their fullest extent would fill a public need for which the public will pay and do so willingly and handsomely

We have tried many schemes to improve our condition Practically all of them have failed Is it not worth trying something which is based upon the fundamental reason for the existence of a profession of pharmacy?

If we are to have a strong, militant and effective profession of pharmacy in the future, we must have strong, efficient and forward-looking colleges of pharmacy We do not need as many as we have, and in the years immediately ahead we shall, no doubt, see a merging of some institutions with others and a complete cessation of activity in a number of these schools It is important in a transition period such as we are now going through that the profession keep a close check on the type of instruction offered in our colleges There is an unfortunate tendency in some universities to turn over the direction of schools of pharmacy to administrators who have no pharmaceutical background It is a mistake for any profession to entrust the destiny of the institutions which train its future personnel to administrators who have not themselves come up through the ranks of the profession Occasionally an able administrator will be found who though not a pharmacist can acquire a sufficient pharmaceutical background over a period of years to enable him to do a fairly good job in promoting pharmaceutical education In general however pharmacy schools which lack the administrative direction of a trained pharmacist do not turn out the best type of raw material needed for the up building of the profession

President Beury is to be congratulated upon

macy, Lloyd N Richardson, president Maryland Board of Pharmacy, John C Krantz, Jr, second vice president, Henry Brown, Executive Committee Penna Pharmaceutical Association, Charles T Pickett, secretary, Philadelphia Association Retail Druggists

Robert P Fischelis, president-elect of the AMERICAN PHARMACEUTICAL ASSOCIATION made the principal talk at the Pharmacy convocation Wednesday afternoon

A large number of guests, students and alumni listened to his scholarly paper 'Pharmacy in Our Changing Era' Parts of the address follow

PHARMACY IN OUR CHANGING ERA

BY ROBERT P FISCHELIS

You must know the changing needs of humanity if you would succeed in life In business in your profession in your housekeeping whatever your life that one thing is the secret of success You must first know the demand You must first know what people need and then invest yourself where you are most needed' Thus spoke Russell Conwell the founder of this great University in his oft-repeated lecture Acres of Diamonds'

At this convocation, commemorating as it does the fiftieth anniversary of the beginning of Temple University and the thirty-third anniversary of the organization of its School of Pharmacy, it may profit us to spend a few minutes in contemplating the Conwell success formula as it applies to the field of endeavor in which we are engaged

How careful have we been to examine the changing needs of humanity with respect to pharmacy? Have we honestly and intelligently endeavored to ascertain what, among the things we have to offer, the people really need? Have we endeavored to invest ourselves where we are most needed? The answers to these questions will reveal how closely we have approached the standards of success as visualized by the founder of this University

We know that the demand for the type of pharmaceutical service which engaged the major part of the retail druggist s attention is no longer demanded to the extent that it was when Temple University organized its School of Pharmacy in 1901

Prescription work has not increased New and more complicated products have replaced the simple drugs in the physician's armamentarium The manufacturing function has been almost entirely eliminated from many of our retail drug stores This is partly due to the necessity for proper chemical and biological control of manufacturing processes or of finished products, which cannot be carried out in the ordinary drug store laboratory It is also partly due to the prohibition era, during which it was made difficult and in some instances impossible for pharmacists to obtain alcohol for manufacturing purposes without endless record keeping and official red tape Nor was it possible to compete with large scale producers who were able to obtain specially denatured alcohol in quantities at greatly reduced prices free from the revenue tax It was also partly due to the growing apathy on the part of pharmacists toward professional work, and their avidity for any kind of merchandising activity which would help to keep their establishments going at a profit

During this same period big business' entered the field of medicine Pharmaceutical manufacturing establishments of long standing became the playthings of financiers Advantage was taken of the fact that anybody can enter the medicine manufacturing business in all states of this Union without meeting any requirements as to scientific or professional training or moral character Our inadequate food and drug laws made it possible for individuals and corporations to grow wealthy at the expense of citizens who take it for granted that whatever anyone may print or say over the radio about a medicine is true Patent and proprietary medicines whose formulas are unrevealed were forced in constantly increasing numbers upon the pharmacist's shelves by the creation of a public demand through advertising of one kind or another and by high pressure sales methods Manufacturers of these products set themselves up as authorities on the diagnosis and treatment of nearly all ailments to which the human flesh is heir, and with the increasing costs of properly regulated, scientific medical care, they found a fertile field among those who considered the taking of medicine an economical way to health in the full faith that their Government would permit no fraud in a field of such great importance to the public welfare Without question, these interests have made inroads upon the practice of medicine and pharmacy, with doubtful benefit at best, and in many cases, with considerable detriment to the public health

'Big business" also entered the retail drug

field It emphasized the merchandising possibilities of every commodity and every service ever offered in retail drug stores Many pharmacists, seeing the material success that attended the efforts of these organizations, deemed it expedient and wise to follow the lead of the corporation stores In many instances this left the pharmacist of the old school far behind in the procession toward business success, wondering how long he might be expected to survive, but doing virtually nothing to determine whether the new developments were really filling a public need or whether they were merely a form of exploitation of a gullible and long-suffering public

How many pharmacists are competent to pass upon the conflicting 'scientific' claims of the many hundred so called antiseptics cosmetics, patent medicines and sundries which are offered an unsuspecting public as health aids with little or no scientific or even practical background? Here indeed we have a public need which the properly educated pharmacist can fill with profit to himself as well to his clientele The people want to know the truth about drugs They obtain exaggerated versions from certain popular literature but these versions are at least as truthful as the advertising which has placed the products criticized among the best sellers of the offerings of the drug store and they have the advantage of warning the public to be on its guard against possible and probable fraud With increasing doubt of the value of drugs engendered in the public mind, the people will listen to and honor a pharmacist who has the courage to tell the truth based upon knowledge and facts

Ali Hafed—in the Conwell lecture 'Acres of Diamonds'—traveled thousands of miles from his home in search of diamonds He died in poverty, but the man who bought Ali Hafed's original farm soon discovered the most perfect diamonds in the garden of the home which Ali had left to wander afar in his ill fated search How true of Pharmacy! We have tried many schemes to improve our condition Practically all of them have failed Is it not worth trying something which is based upon the fundamental reason for the existence of a profession of pharmacy?

If we are to have a strong militant and effective profession of pharmacy in the future we must have strong, efficient and forward-looking colleges of pharmacy We do not need as many as we have and in the years immediately ahead we shall, no doubt see a merging of some institutions with others and a complete cessation of activity in a number of these schools It is important in a transition period such as we are now going through that the profession keep a close check on the type of instruction offered in our colleges There is an unfortunate tendency in some universities to turn over the direction of schools of pharmacy to administrators who have no pharmaceutical background It is a mistake for any profession to entrust the destiny of the institutions which train its future personnel to administrators who have not themselves come up through the ranks of the profession Occasionally an able administrator will be found who though not a pharmacist, can acquire a sufficient pharmaceutical background over a period of years to enable him to do a fairly good job in promoting pharmaceutical education In general however, pharmacy schools which lack the administrative direction of a trained pharmacist do not turn out the best type of raw material needed for the up building of the profession

President Beury is to be congratulated upon

having followed the Conwell formula of looking for the diamonds in your own home ground, when selecting as the Dean of your Pharmacy School, to succeed the late Dean Minehart a man who not only knows pharmacy from actual contact but whose services to the University over a long period of years have qualified him most admirably to lead this institution to newer and greater spheres of usefulness Dean Kendig s approach to the problem of educating pharmacists to meet the newer and broader responsibilities of the future has been both statesmanlike and practical I am glad to pay this tribute to the splendid efforts he is putting forth in your behalf

We have been spending much time in building up a national pharmaceutical curriculum based upon minimum hours required subjects and a cultural background The modern idea of university education is to lay less emphasis upon class work schedules and required attendance In the words of Woodrow Wilson The University spirit is intolerant of all things that put the human mind under restraint It is intolerant of everything that seeks to retard the advancement of ideas the acceptance of truth, the purification of life ' We still have a considerable road to travel to place pharmaceutical education on the level of the newer ideas for developing a liberal educational program The time is not far distant however when such a program must be given more serious consideration Graduate work in our colleges of pharmacy must be developed if we are to man state and national pharmaceutical associations colleges of pharmacy and boards of pharmacy with the kind of personnel that will develop our profession along lines of greater usefulness

Finally, it is incumbent upon those who have the management of our two great national associations in charge to give consideration to the possibility of merging their activities It is not necessary to merge the physical equipment and other assets of these associations in order to bring about a more coordinated program of activity There should, however, be a clearly defined line of activity which each of our national organizations should undertake and in which each of them should be considered the acknowledged leader Both organizations should place their entire resources back of the joint programs and should unselfishly assist each other in carrying their respective programs to a successful issue This is no time for petty quarrels There are too many big things at stake There is within the membership of these national organizations sufficient intelligence and ability to work out an effective plan of cooperation, and such a plan should be worked out without delay

Allowing to morrow to take care of itself is, in the long run, a destructive procedure We are suffering to day from the lack of foresight and constructive planning of the generation immediately preceding ours Let us not fall into the same error Let us also in the spirit of Russell Conwell, remember that Pharmacy is not a thing conceived to please pharmacists It is a thing with which pharmacists must please mankind in general

Left, C Lewis Diehl, *right*, William S Thompson, Washington, D C, president, A Ph A, 1884 (see page 83, February) on Mississippi steamer, St Louis 1901 See historical paper by John E Kramer in this issue of the JOURNAL

NOTICE TO RESEARCH WORKERS IN PHARMACY

The Annual Census of Pharmaceutical Research under the auspices of the National Conference on Pharmaceutical Research is being compiled All reports must be sent promptly to Dr James C Munch 40 North Maple Avenue Lansdowne Pa in order to be included in this year s census Census blanks may be obtained by writing the office of the *Secretary* 2411 North Charles Street Baltimore, Maryland

EDITORIAL NOTES

DONATION OF MORTARS

Dr Γ B Tipton, of Washington has do nated two mortars and pestles, one a lignum vitæ and the other of bell metal which has an interesting recorded history It was brought to this country from England by Captain Dr William Stone, November 22 1633 who landed in Maryland March 25 1634 He obtained the mortar and pestle from his father in 1622 The former was Governor of Mary land from August 6, 1648 to July 20 1654 The history is complete up to the present day— Dr Tipton received the mortar from Robert Pinkney Stone on March 16 1931 and it was donated to the AMERICAN PHARMACEUTICAL ASSOCIATION by the former on March 16 1934

A COOPERATIVE MOVE

The regularly licensed and registered prac titioners of Medicine Dentistry and Pharmacy of Kansas have formed an organization to bring about professional cooperation and en hance the well being of the public It is known as The Public Health Council of Kansas "

LANDMARKS SOCIETY OF ALEXAN DRIA TO RESTORE THE STABLER PHARMACY

A charter for a non stock corporation has been applied for under the new name of Land marks Society It was also voted unani mously to restore the building as far as possible to the condition of 1792, using the material recently discovered in the attic of the old Stabler store for this purpose From the opinions of the architects that have been consulted this restoration of the 1792 condi tions appears to be well endorsed It seems certain however that it cannot be completed in time for exhibition in May The Lead beater (Stabler) Apothecary was recently acquired for the AMERICAN PHARMACEUTICAL ASSOCIATION

PERSONAL AND NEWS ITEMS

Under direction of Chairman **Anton Hogstad, Jr**, of the Pharmacy Week Committee Okla homa Pharmaceutical Association will have an exhibit of a Modern Pharmacy patterned after that held by Wisconsin Pharmaceutical Association

Dr Henry S Johnson, of Connecticut College, College of Pharmacy is giving a series of lectures on pharmacy and pharmaceutical preparations to the students in Yale University School of Medicine in connection with their course in pharmacology These lectures are being given at the invitation of Dr Henry G Barbour Head of the Department of Pharma cology in the School of Medicine Dr John son is being assisted in his work by Prof Fuller and Mr Fenney of the Pharmacy De partment of the Connecticut College of Pharmacy

Dr Edward Kremers delivered the principal address at the celebration of the 50th anniver sary of the founding of the School of Pharmacy, Purdue University The subject of his address was Pharmaceuticals in the United States as Influenced by the Universities of the Old Northwest Territory '

Secretary **J Lester Hayman** advises that the campaign in West Virginia has resulted in an increase of $33^1/_3\%$ of membership of the State association

Dr Paul N Leech, director of the American Medical Association Laboratories in Chicago delivered two lectures before Purdue University section of the American Chemical Society In his first lecture Dr Leech discussed cos metics antiseptics and proposed food and drug legislation (Copeland bill) He stated that the American Medical Association indorses the intention of the Copeland bill but that he personally felt it would be better to amend the old bill than to introduce an entirely new one, inasmuch as the old Act has been tested by numerous Supreme Court decisions

In his second lecture Dr Leech discussed late developments in the drug field

Prof Heber W Younken recently was expert witness in a case involving the respon sibility for two deaths The determination was based on his testimony following micro scopical examination of adhering particles to the bullets that caused the deaths

On February 28th the Board of Trustees of The Tennessee Academy of Science unani mously elected **Dr A Richard Bliss, Jr,** director of The Reelfoot Lake Biological Station at Reelfoot Lake, Tennessee

SOCIETIES AND COLLEGES

TRANSPORTATION TO THE WASHINGTON MEETING WEEK OF MAY 7TH

Chairman Theodore J Bradley of the Transportation Committee and E F Kelly secretary of the AMERICAN PHARMACEUTICAL ASSOCIATION have been advised by the various passenger associations that the identification ticket plan concession of $1\frac{1}{3}$ fare for the round trip has been allowed Identification certificates will be sent out later to members and those contemplating the trip should see their passenger agents as promptly as possible so that there will be no question when purchase of tickets is made The tickets are good *via* the same route in both directions and will be sold from April 28th to May 9th, inclusive and before being honored for return, return portions of the tickets must be validated at Washington or Baltimore The tickets include thirty days in addition to date of sale and validated tickets will be good for return leaving on any day within final limit

Round trip tickets will also be sold on the $1\frac{1}{3}$ fare basis going *via* any authorized route published in one way tariffs returning *via* any other authorized route published in one way tariffs

It will be necessary for members when purchasing round trip tickets to present and surrender the identification ticket issued account of the meeting and to indicate to ticket agents which ticket is desired namely, (1) $1\frac{1}{3}$ fare for round trip good for same route in both directions, final return limit thirty days in addition to date of sale (2) $1\frac{1}{3}$ fare for round trip going *via* any authorized route and returning *via* another authorized route In both cases the final return limit is thirty days in addition to date of sale

The identification certificates will bear the signature of E F Kelly, secretary of the A PH A and will be mailed to members very soon

PAPERS FOR THE SECTIONS AND CONFERENCES

Members who will present papers at the Washington meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION should send them in promptly to the Section officers, carbon copies may be sent to the Editor of the JOURNAL A PH A, 2215 Constitution Ave, Washington D C

The Scientific Section has issued the following call

Members and Friends of the Scientific Section, American Pharmaceutical Association

The 82nd annual meeting will be held in Washington D C, during the week of May 7th and will include the dedication of the new headquarters building The Scientific Section plans to hold several interesting sessions but in order to accomplish this the officers must have your cooperation

Since the Convention date is much earlier than usual and now is only about six weeks away, it will be necessary for authors of papers to submit titles and very short abstracts to the Secretary by April 15th at the very latest in order that the titles may appear in the printed program Authors should indicate whether the papers are to be presented in person or by title and should bear in mind that ten minutes is the time limit for the presentation of a paper

F E BIBBINS, *Chairman*, Scientific Section

L E ROWE, *Sec'y*, Scientific Section, c/o Parke, Davis & Co Detroit, Michigan

The Scientific Section has received the following papers

1 The Effect of Hydrogen Peroxide and Some Oxygenated Terpenes upon Ascaris Lumbricoides," L W Butz and W A La Lande, Jr

2 'A New Method for Determining Acetyl Salicylic Acid in the Presence of Other Medicinal Products," R M Hitchens

3 "The Stabilization of Syrup of Ferrous Iodide U S P X," William J Husa and Lyell J Klotz

4 "Drug Extraction I A Study of Various Manstrua from the Standpoint of Swelling Effects, Penetration and Extraction," William J Husa and Louis Magid

5 'Drug Extraction II The Effect of Fineness of Powder and of Variation in Solvents on the Percolation of Belladonna Root," William J Husa and C L Huyck

6 'Drug Extraction III The Function of Preliminary Maceration in Relation to the Percolation of Belladonna Root," William J Husa and S B Yates

7 "Drug Extraction IV The Effect of Variation in Solvents on the Extraction of Jalap" William J Husa and Faul Fehder

PHARMACY EXTENSION DEPARTMENT, PURDUE UNIVERSITY

The fourth annual Druggists' Business Conference was held at Purdue University, March 20th The occasion had added interest in the celebration of the semi centennial of the school of pharmacy Editor Jerry McQuade and Harry S Noel delivered addresses Al Fritz, of Indianapolis, discussed the present drug codes Other speakers were Ray Whidden and Secretary Frank V McCullough who discussed legislation in Indiana

The semi-centennial celebration was held following the conclusion of the Business Conference at which time the principal speaker was Dr Edward Kremers of Wisconsin The meeting closed with a banquet

KANSAS PHARMACEUTICAL ASSOCIATION

Kansas Pharmaceutical Association will hold its annual sessions in Salina April 10th–12th Among the speakers will be Dr Frank Kirby secretary of the Pharmacy Exhibit at the World's Fair in Chicago, his subject will be "Detailing for Prescriptions" As part of the program the Sayre Club will have a memorial meeting in honor of the late L E Sayre

Election of officers of the Association is by mail ballot

PENNSYLVANIA BOARD OF PHARMACY EXAMINATIONS

Examination for applicants desiring registration as Pharmacist will be conducted in the Philadelphia College of Pharmacy 43rd Street and Kingsessing Avenue Philadelphia and

the Pittsburgh College of Pharmacy, 1431 Boulevard of the Allies Pittsburgh on Thursday and Friday April 5 and 6, 1934

Assistant Pharmacist Examination—In the Philadelphia College of Pharmacy 43rd Street and Kingsessing Avenue, Philadelphia, and the Pittsburgh College of Pharmacy, 1431 Boulevard of the Allies on Saturday April 7, 1934, 9 00 to 4 00 o clock

OKLAHOMA UNIVERSITY PHARMACEUTICAL ASSOCIATION

The first annual convention of Oklahoma University Pharmaceutical Association was held March 9th in the Pharmacy Building, Norman Okla An interesting program, including all divisions of pharmacy was carried out Scientific Section Section on Practical Pharmacy and Dispensing Section on Commercial Interests Section on Historical Pharmacy In each of these divisions instructive papers were read and discussed

AMERICAN DRUG MANUFACTURERS' ASSOCIATION

The American Drug Manufacturers' Association will hold its twenty third annual convention at the Greenbrier, White Sulphur Springs, W Va, April 16th to 19th The scientific and biological sections have prepared an interesting program including among other subjects concerning alkaloid and drug standards analytical assay methods chemical tests and standards crude and milled drugs, digestive forms and glandular products drug extracts, pharmaceutical investigations

The chairman of the Committee on Alkaloid and Drug Standards, F O Taylor, has been studying some methods of tests now used in the Pharmacopœia which are open to criticism in one way or another The Biological Section has arranged a program which will have as a feature an address by Dr George W McCoy

DISTRICT MEETINGS

District No 1 Board and College members held its annual meeting at the Massachusetts College of Pharmacy on March 14th–15th

A very interesting and profitable meeting of the Boards of Pharmacy and the Colleges of Pharmacy in District No 2, including New York Pennsylvania New Jersey Delaware District of Columbia and Maryland was held at Hotel Emerson, March 12th to 13th There was a very good representation from the several states An address on "The Relation of Pharmacy to Public Health" was made by Dr Huntington Williams, Commissioner of Health of Baltimore City The Baltimore Branch of the A Ph A took an active part in the meeting which will be reported with that of the Branch

A general meeting of members of the bodies of District No 7, comprising Georgia, Florida Alabama, Mississippi, Louisiana Porto Rico, was held March 26th–27th in St Petersburg Florida The chairman for the Colleges was Wm J Husa for the Boards Charles H Evans

Among the questions discussed were the following Standardization of Experience," Accuracy of Prescription Filling" from the teaching standpoint and from the enforcement standpoint Minimum Standards of Technical Equipment for Drug Stores ' 'Various Branches of Teaching and the Subjects to Be Taught " ' The Nature of Board Examination Questions and Reciprocity " Legislation of various phases relating to the drug industry was discussed

CONNECTICUT COLLEGE OF PHARMACY ESTABLISHES SCHOLARSHIPS

Announcement has been made by the Connecticut College of Pharmacy that four scholarships, the total value of which is about $1000 will be awarded next September to graduates of high and secondary schools of Connecticut

MID-WINTER MEETING, NEW JERSEY PHARMACEUTICAL ASSOCIATION

The mid winter meeting of New Jersey Pharmaceutical Association was held in Trenton, N J, March 8th at which time matters affecting legislation and concerned with the codes were discussed

The New Jersey Pharmaceutical Association and its Retail Drug Trade Alliance, have been working on a state code which has been presented to the legislature There are pending in the legislature also bills affecting the practice of pharmacy and provision to investigate business methods and practice of chain and cut rate" drug stores in New Jersey

The New Jersey Board of Pharmacy will hold examinations for applicants for the Registered Pharmacist certificate at the State House New Jersey on April 19th

NEW ENGLAND DRUG SHOW

The New England Drug Show will be held at Mechanics Building in Boston during the week of April 2nd At this time the annual spring conference of New England druggists will be held

HISTORICAL EXHIBIT IN NEW BRUNSWICK HOSPITAL

An interesting exhibit was arranged in St Peter's Hospital, New Brunswick, N J The exhibit depicted the history of the institution by charts photographs and statistical data

A pathological and clinical laboratory was installed in 1920 In 1921 Dr and Mrs F B Kilmer founded a nurses library of more than 2000 volumes in memory of their son Joyce Kilmer killed in the World War Dr Kilmer has been a member of the AMERICAN PHARMACEUTICAL ASSOCIATION for nearly a half century

OLD APOTHECARY GLASSWARE

Liebig s laboratory at Giessen once internationally famous as a center of chemical instruction, has been converted into a museum housing exhibits illustrative and commemorative of the great scientist's many activities and interests The pharmaceutical section is quite prominent The museum is administered by a corporation, Gesellschaft Liebigmuseum, and its moving spirit is Prof Robert Sommer of the medical school, who is largely responsible for the salvation of the old laboratory building for museum purposes, and to him also is due the credit for the untiring devotion entailed in collecting the interesting material on view

The museum has a collection of glassware, reproductions typical of the Apothecary shop known to Liebig Arrangements have been made for the reproductions by the Gesellschaft Liebigmuseum at Giesen These bottles lend a charming and distinctive note to a pharmacy and may be obtained from the society mentioned

LEGAL AND LEGISLATIVE

CALIFORNIA FAIR TRADE ACT CONSTITUTIONAL

Provision added by 1933 legislature, prohibiting "Unwholesome and Predatory Practices in the Merchandising of Goods, ' was upheld and defendant enjoined from selling below firm price fixed by distributor

That section $1^1/_2$ of the California Fair Trade Act, added by the 1933 Legislature (Statutes of 1933, page 793) which forbids any person from wilfully and knowingly advertising offering for sale or selling any commodity at less than the price stipulated in any contract entered into pursuant to the provisions of Section 1 of this Act whether the person so advertising offering for sale or selling is or is not a party to such contract is unfair competition and is actionable at the suit of any person aggrieved—is constitutional has been held by Judge Timothy I Fitzpatrick of the Superior Court of the City and County of San Francisco, Department 8, in the case of Weco Products Co of California *vs* Sunset Cut Rate Drug Co *et al*, decided January 24, 1934

NATIONAL RECOVERY ADMINISTRATION

A committee of twelve members representing the distribution and consumers service trade, similar in purpose to the two industrial committees named during the recent Code Authority Conference, was announced on March 14th by National Reconstruction Administrator Hugh S Johnson This committee has been at work during the week and will advise the Administrator on various problems The committee is headed by Rivers Peterson *chairman* of National Retail Code Authority The committee is composed as follows (1) Retail consisting of four members The retail drug industry is represented by Secretary E F Kelly of the A PH A, who is also secretary of the National Retail Drug Code Authority (2) Wholesale, composed of four members The wholesale drug industry is represented by E L Newcomb executive vice-president of the National Wholesale Druggists' Association The consumers' service also has four members

It is the intention of the committee to make a real contribution toward effecting all of the twelve points outlined in General Johnson s speech to the Code Authority Meeting

THE AMENDED COPELAND BILL

S 2800—Mr Copeland of N Y To prevent the manufacture shipment and sale of adulterated or misbranded food drink, drugs

and cosmetics, and to regulate traffic therein, etc , reported from committee on March 15th, the bill has been amended in a number of sections

The labeling requirement for drugs used as a palliative for specific diseases has been changed to require that the nature of the palliative action of the drug rather than its palliative effect be shown on the label The paragraph, providing that advertisements of drugs represented to have any effect in the treatment of a list of some forty diseases are presumed to be false is striken out For the purpose of consultation in formulating general administrative policies for the enforcement of the bill there is authority for the secretary to appoint advisory committees from the food, drug, cosmetic and advertising trades and from the public

New sections added to paragraphs dealing with injunction proceedings would provide that as a means for avoiding multiplicity of libel for condemnation proceedings the federal district courts would have authority to restrain by injunction the institution of more than one seizure action against any product (1) if the alleged violation is of misbranding only (2) if all current shipments bear the same labeling (3) if the alleged misbranding does not involve danger to health or gross deception, and (4) has not been the basis of a prior judgment in favor of the United States in any criminal prosecution for libel under the bill The date when the bill is to become effective is made twelve months from its enactment into law instead of six months Upon approval by the President, the Secretary of Agriculture is to designate foods having common or usual names and exempt them from the labeling provisions of the bill for a reasonable time to permit formulation, promulgation and application of definitions and standards of identity therefor — Status Reported by S Com on Commerce, 3–15–34

According to press reports Arthur D Whiteside, brought into NRA by General Johnson as administrator has vacated his Washington quarters and returned to New York to resume his place as president of Dun & Bradstreet

BOOK NOTICES AND REVIEWS

The Chemical Formulary distributed by the Chemical Formulary Company, Bush Terminal Building No 5 Brooklyn N Y 600 pages Price $6 00 The Board of Editors consists of about sixty contributors

The Formulary contains methods for making varieties of face and skin creams toilet preparations including lotions, shampoos, hair preparations tooth powders and pastes perfumes, bleaches deodorants, etc Other lists include anti freezes adhesives beverages blacking, cleaners colors, crayons, driers, drycleaning soap, dyes embalming fluid, emulsions enamel, explosives, extracts fillers, fire-proofings, foams, food specialties, fuel glazes, glue, incense, insecticides, ink, lacquer latex, leather, liniments liquor lubricants moth exterminators mildew proofing mouth wash, paint, pigments, plastics, plating polish, preservatives rat-poison rubber goods rust proofing, shoe cleaners soaps solvents styptics, varnish viscose, waterproofing wax, synthetic wax polish weed killer, wood filler, etc

The publishers state that many of the formulas are used commercially, others are taken from patent specifications publications and other sources with the end in view of supplying dependable information The value of formulas depends largely on whether practical and satisfactory application has been made of them how far this has been done the reviewer is not in position to say There is lack of uniformity in the publication of formulas in abbreviations, capitalizing in giving quantities etc This may not detract from the value of the formulas but it is noticeable, thus, under 'Removing Stains—Chromic Compounds Chromates Sod Bisulphite or Sod Hyposulphite and dilute sulphuric acid" Lead Compounds — Stain with Tinc Iodine, dry and dissolve with concentrated pot iodide solution'

Quantities are given in different weights and measures, in parts, in percentages and without designation, such variations occur on the same page A heading reads 'Stone, Artificial," the one following, Synthetic Stone" In a formula there are the following abbreviations compn" for composition, "prepd" for prepared 'HCl" the strength is not given As heretofore stated, these defects may have no bearing on the value of a formula Some of the formulas are indefinite, but no attempt has been made to check up on ingredients and quantities and the resulting product, it is assumed the publishers have endeavored to present formulas that are reliable However, in the opinion of the writer, the value of "The Chemical Formulary' is not enhanced by the inclusion in some formulas of certain advertised specialties without naming the constituents

SIR HENRY S WELLCOME

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIII APRIL 1934 No 4

THE REMINGTON HONOR MEDALIST FOR 1934

Sir Henry S Wellcome, of London, England, is the Remington Medalist for 1934 and the formal award will be made during the week of May 7th in Washington He is a native of Wisconsin, later the family moved to Minnesota where he received his early pharmaceutical training under an English chemist, manager of pharmacy in Garden City, thereafter the young man was placed in charge of the dispensing department of a pharmacy in Rochester, Minn After several years of experience, he engaged with the late Thomas Whitfield, Chicago, and attended the Chicago College of Pharmacy, in the year following he matriculated at the Philadelphia College of Pharmacy and graduated in 1874, being a classmate of Dr Frederick B Power [1] Influential factors in the beginnings of many of Mr Wellcome's activities are referred to in the July number, 1925, of the JOURNAL, and others are noted in this sketch

His interest in ethnological and archeological subjects had its inception in days of his frontier life and has found expression in his large undertakings and many activities, his analytical mind and powers of observation are always linked with a purpose to be of service

In 1879, Mr Wellcome visited South America and made a survey of the indigenous cinchona forests and reported the results of his investigations to the AMERICAN PHARMACEUTICAL ASSOCIATION, printed in its PROCEEDINGS, volume 27

In 1887, he published "The Story of Metlakahtla," which relates to a tribe of Indians in Alaska, transformed from savagery into peaceful, industrious citizens through education and adoption of Christianity, under the leadership of William Duncan, a missionary

Professor G A Reisner, distinguished archeologist of Harvard University, writing of Sir Henry's excavations in the Upper Nile region, said "The excavations carried on by Henry Wellcome have thrown unexpected light on early Ethiopian history in this region [2]"

[1] See Volume XI, JOUR A PH A (1922), 403

[2] The extent of these archeological diggings may be gathered from the employment of twenty-five members of the Administration staff and 3000 native workmen

Sir Henry's American interests are wide and varied In 1910, when there was a strong probability of cutting down appropriations for the work of General Gorgas, it was the former's interest and valuation of tropical research that influenced the Government's continued and larger support of this important work He is a director of the Gorgas Memorial Institute which operates scientific laboratories in Panama for research work touching cause and prevention of tropical diseases He has established and coordinated under separate and distinct direction—The Wellcome Bureau of Scientific Research, London (1913), the Museum of Medical Science (including Tropical Medicine and Hygiene) (1914), the auxiliary Entomological Research Laboratory at Clarementon, Esher, Subrey, England (1915), the Wellcome Tropical Research Laboratories at the Gordon Memorial College, Khartoum, Anglo-Egyptian Sudan, Upper Nile, Africa (1901), and the fully equipped auxiliary Floating Tropical Research Laboratory on the Upper Nile, and its tributaries (1906)

Sir Henry has received world-wide recognition for his outstanding services to science and medicine, for his interest in missionary enterprises, for his personal work in medical research, the history of medicine and pharmacy Apart from the research and experimental laboratories of the establishments of Burroughs Wellcome & Co , the following are some of his many enterprises

' The Wellcome Physiological Research Laboratories," London (1894), "The Wellcome Chemical Research Laboratories," London (1896), "The Wellcome Historical Museum," London (1913) In November of 1931, in London, the cornerstone was laid for "The Wellcome Research Institution," required for coordinating and extending the activities of the Wellcome chemical and medical research laboratories and museums

Knighthood was conferred on Dr Wellcome by King George V in 1932, in recognition of his life-work and generous support of medical research He is an Honorary Fellow of the Royal College of Surgeons, fellow of the Royal Society, of the Royal Society of Medicine, of the Royal Society of Tropical Medicine and Hygiene, London, Honorary Corresponding Doctor of the Ancient College of Medicine, Madrid, etc In 1865, he was awarded the Royal Humane Society Medal for life-saving, in 1928 the University of Edinburgh conferred on him the honorary degree of Doctor of Laws He is a member of many clubs in Great Britain and of a number in the United States—Lotus Club, New York, Cosmos Club, Washington, etc

Mr Wellcome became a member of the AMERICAN PHARMACEUTICAL ASSOCIATION in 1875, and has always taken an active interest in its work, in 1931, he was elected honorary president of the ASSOCIATION Very early in the campaign for the establishment of the Headquarters he took an active part in the project evidenced by words and deeds

---

Dedication ceremonies are scheduled for Wednesday morning, May 9th The banquet and all other meetings of the Annual Convention will be held at the Shoreham, the headquarters hotel

EDITORIAL

E G EBERLE, EDITOR 2215 Constitution Ave , WASHINGTON, D C

PHARMACY IN HOSPITALS

THE practice of pharmacy since it affects the public health should be regulated in the public interest and restricted to those who have been trained and licensed for this responsible work after their fitness has been proved through examination by a state agency The AMERICAN PHARMACEUTICAL ASSOCIATION has consistently worked to put this principle into practice and to throw every protection, possible of application, around the practice of pharmacy and around the use of drugs, medicines and medical supplies by the people A very important step in this program has just been taken and one which will have a splendid effect as it comes into general application

The American Medical Association, through its Council on Medical Education and Hospitals, maintains a list of recognized hospitals and related institutions One issue of its *Journal* is known as the Hospital Number" and is devoted to information about hospitals and related institutions and to the list of registered hospitals The "Hospital Number for 1934 was issued on March 31st

In the course of its work, the Council on Medical Education and Hospitals has prepared a number of ' Essentials of a Registered Hospital" and admits annually to its Hospital Register only those that are found to qualify according to these essentials The Council disclaims any legal authority over a hospital and recognizes clearly the right of those responsible for a hospital to conduct it as may seem wise to them It does require of a hospital or related institution, desiring to have its name appear on the Hospital Register, that it be willing to comply with the principles considered necessary for such endorsement Undoubtedly this procedure has been effective in raising the standards of these institutions In connection with the Essentials, the statement is made that "It is the desire of the Council to cooperate in every way for the improvement of hospital service, whereby the sick and injured may be provided with scientific and ethical medical care "

After a careful consideration of the practice of pharmacy in hospitals, the AMERICAN PHARMACEUTICAL ASSOCIATION decided that the first step toward the improvement of the pharmaceutical service was to request the inclusion among the "Essentials of a Registered Hospital" of one dealing with pharmacy The Council on Medical Education and Hospitals approved this request, and among the Essentials as published in the recent "Hospital Number" is the following "5 Pharmacy The handling of drugs should be adequately supervised and should comply with state laws " Although this requirement is not as specific as it should be, it is a distinct recognition of the place of pharmacy in the hospital, represents a step in the right direction and, no doubt, will be amplified as experience is gained in its application

With this requirement as a basis, the Boards of Pharmacy, and other institutions concerned should give hospital authorities every cooperation in making it as effective as conditions render possible Pharmacists and their organizations should concern themselves to see that the pharmaceutical service in each hospital is adequate and that it complies with the requirements of the state laws If the

requirements of a hospital do not justify a pharmacy in charge of a pharmacist, arrangements should be made if they do not exist, for local service

The inclusion of this requirement is another indication of the cooperation which should exist among the public health professions The AMERICAN PHARMACEUTICAL ASSOCIATION wishes to record its appreciation of the action of the Council on Medical Education and Hospitals which it is believed will lead to a more effective pharmaceutical service in the hospitals of our country —E F K

PERIODS IN THE HISTORY OF THE NATIONAL FORMULARY AND ITS PRECEDENTS

THE New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION on April 9th celebrated the 50th Anniversary of the New York and Brooklyn Formulary, the precursor of the National Formulary The former was published by a joint committee of delegates from the College of Pharmacy of the City of New York, the New York German Apothecaries' Society and the Kings County Pharmaceutical Society and entered according to Act of Congress in 1884, by the bodies named, Charles F Schleussner, secretary of the Joint Committee, was present at the meeting held in celebration of the anniversary

Wilbur L Scoville, former chairman of the Committee on National Formulary, has prepared a history of the National Formulary for the ASSOCIATION, which he sketches under five divisions, including the earlier efforts to compile a formulary of unofficial preparations and the success of the New York and Brooklyn Formulary, he refers to the incorporation of the AMERICAN PHARMACEUTICAL ASSOCIATION in 1888, and details the editions of the succeeding revisions of the Formulary The author has made an interesting and valuable contribution while recording pharmaceutical history

During the period prior to the organization of the AMERICAN PHARMACEUTICAL ASSOCIATION, the apothecaries perfected the methods of manufacturing the galenicals and other remedial agents on which they built up their reputation and patronage, as a result of the individual studies and variety of products under the same or related names the preparations differed widely in strength, appearance and flavor Attempts had been made to establish greater uniformity prior to the organization of the AMERICAN PHARMACEUTICAL ASSOCIATION, but the efforts of organized pharmacy were more successful and brought about greater improvements in dispensing

"The need for a standard formulary was among the earliest considerations of the ASSOCIATION" The first record of the movement was made in the transactions of the meeting held in Cincinnati, in 1854, when it was moved that "the unofficial formulæ communicated by Messrs Matthews of Buffalo, Cummings of Maine, and Meakim of New York and contained in the report of the executive committee be preserved by the Secretary with a view to publication when future similar publications accumulate sufficiently to justify it"

Mr Scoville comments—"It is interesting to note that the first idea of a formulary as representing preparations used by physicians has held throughout the years without deviation and still represents the ideal of the National Formulary"

During the years following the early report heretofore referred to, dissenting views obtained relative to elixirs and many heated arguments occurred at a number of annual meetings of the ASSOCIATION

Acting on the suggestion of J S Bendiner, of New York, the New York and Brooklyn Formulary was published by a joint committee of the College of Pharmacy of the City of New York, the German Apothecaries' Society of New York, and the Kings County Pharmaceutical Society The Formulary met with favor by physicians and the desire to serve was expressed when the publishers offered to transfer the copyright to the AMERICAN PHARMACEUTICAL ASSOCIATION so that a wider use of the Formulary might be developed and its purpose extended This acceptance necessitated that the ASSOCIATION be chartered and this was perfected in February of 1888, in Washington It may be noted here that all of the members of the committee on the National Formulary were retail pharmacists, except Charles Rice, a hospital pharmacist, and Professor P W Bedford This edition of the National Formulary was published in the volume of the PROCEEDINGS and also separately

No attempt is made in this comment to detail the history of the National Formulary, Chairman E N Gathercoal has reported on the progress of National Formulary VI at recent annual meetings of the A PH A , and historical records are published in each edition of the National Formulary

Quoting W L Scoville, a former chairman, "the primary question in National Formulary revision is, what preparations do the physicians wish to use, and no question is raised why they wish to use them The National Formulary makes no dispute concerning the physician's therapeutic judgment It recognizes his legal and ethical right to his own discriminating purpose, and merely aims to add the prestige of uniformity in composition and appearance and of pharmaceutical skill in compounding to the physician's desire " In medical and pharmaceutical practices the Pharmacopœia and the National Formulary serve important purposes in public health activities

Those who laid the foundations of the standards and of the AMERICAN PHARMACEUTICAL ASSOCIATION rendered valuable services to medicine, the public, pharmacy and the drug industry in its several divisions

---

The time and place for the 1934 meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION—Washington, May 7th to 12th—were selected to accord with the plans for dedicating the Headquarters Building The occupancy of this building which with other structures that may later be erected on the site will be known as the American Institute of Pharmacy, is one of the most important events in the long history of the ASSOCIATION and marks the successful completion of the most extensive and far-reaching effort the ASSOCIATION has undertaken

A cordial invitation is extended to our members, to every one who contributed to the Headquarters Building and others interested in the progress of Pharmacy, to attend the meeting, particularly the dedication on May 9th The earnest desire is that no one should fail to understand that the invitation is all-inclusive of those interested

SCIENTIFIC SECTION

THE HYPERGLYCEMIC ACTION OF FORTY AMINES *

BY ROBERT C ANDERSON AND K K CHEN

It is well known as a result of the work of Blum (1), Herter and Wakeman (2), Paton (3) and others that subcutaneous or intravenous injections of epinephrine are followed by a rise of blood sugar Hyperglycemia also occurs with the homologs of epinephrine, and with tyramine and ephedrine, as shown by Morita (4), Kageyama (5), Nagel (6) and Wilson (7) It seems that pressor substances generally raise blood sugar Nagel (6) has gone as far as to say that the elevation of the blood sugar content can be considered as a measure of the influence of a substance on the sympathetic nervous system

In previous communications, Chen, Wu and Henriksen (8), Swanson (9) and Chen and Chen (10) reported their study on a group of amines related to ephedrine and epinephrine, mostly synthetic, with reference to their pressor action, toxicity, effect on smooth muscle organs, and other structures The present investigation deals with the influence of forty such amines upon the blood sugar Particular attention is drawn to any possible correlation between the pressor and hyperglycemic actions as the chemical structure varies

The entire list of forty compounds is found in Table I The majority of the substances are derivatives of the following three formulas

1 C_6H_5 CH NHR [I]

2 C_6H_5 CHH^1 CHR NR^1R^2 [II]

3  [III]

wherein R, R^1 and R^2 = H or alkyl group, H^2 = H, OH, alkyl or alkyloxy, and H^1 and H^3 = H or OH Four additional compounds are derivatives of indolethylamine, three, of phenyl-piperidyl-carbinols, and one, of phenyl-pyrazolone In all, twelve primary, twenty-five secondary, two tertiary amines and one quaternary ammonium iodide are included

Rabbits weighing approximately 2 Kg were used for study Aqueous solutions of the hydrochlorides of the salts were injected in the marginal vein of one ear and samples of blood were taken from that of the other Equimolecular doses, that is, 1 cc of a $M/10$ solution, were given, except a few, the toxicity of which was too great In such instances, the amount was reduced Three animals were used to study each compound Blood samples, besides the controls, were taken 2, 5, 10, 20, 30, 40, 50 and 60 minutes after injection, and every half hour thereafter until the sugar concentration approximately returned to normal The blood sugar was determined by the method of Hagedorn and Jensen (11) Six compounds were also studied following subcutaneous injection The results for each were averaged and summarized in Table I

* Scientific Section A PH A Madison meeting 1933

1 COMPOUNDS OF FORMULA [I]

Only two compounds, Nos 1 and 2, belonging to the general formula, C_6H_5-CH_2NHR, were studied No 1, $C_6H_5CH_2NH_2HCl$, produced on the average a rise of 25 mg of sugar per 100 cc of blood, reaching its peak in 30 minutes after injection, while No 2, $C_6H_5CH_2NHCH_3HCl$, produced a rise of 18 mg, the maximum occurring in 10 minutes In this case the primary amine seems to have a greater and more prolonged hyperglycemic action

2 COMPOUNDS OF FORMULA [II]

Twenty-two compounds of the type, $C_6H_5CHH^1CHRNR^1R^2$, were investigated This includes the six optical isomers of ephedrine No 3, β-phenyl-ethylamine HCl, produced a rise of 27 mg, while No 4, with the OH group on the β-C atom, produced a rise of only 14 mg No 3 reached its peak at 40 minutes after injection, while No 4 attained its greatest effect at the end of an hour It is interesting to note that No 4 was the only compound which consistently produced

TABLE I —COMPOUNDS EXAMINED FOR HYPERGLYCEMIC ACTION

Compound No	Hydrochlorides of	Results: Maximal Rise of Blood Sugar mg per 100 cc Blood	Results: Time to Reach Peak after Injection (Minutes)
1	$C_6H_5CH_2NH_2$	25	30
2	$C_6H_5CH_2NHCH_3$	18	10

29	*p* $CH_3OC_6H_4CHOHCHCH_3NH_2$	18	30
30	*3 4* $(HO)_2C_6H_3CHOHCH$ $NHCH_3$ *l* Epinephrine	55	60
31	*3 4* $(HO)_2C_6H_3CHOHCHCH_3NH_2$ *3 4* Dihydroxy *nor* ephedrine	45	30
32	*3 4*-$(HO)_2C_6H_3CHOHCHCH_3$ $NHCH_3$ *3 4* Dihydroxy ephedrine	3	50
33	$C_8H_6CH_2CH_2NH_2$ Tryptamine	24	40
34	$C_8H_6CH_2CH_2NHCH_3$ Methyl tryptamine	29	60
35	$C_8H_6CH_2CH_2N(CH_3)_2$ Dimethyl tryptamine	35	30
36	$C_8H_6CH_2CH_2N(CH_3)_3I$ Trimethyl tryptamine quaternary ammonium iodide	50	20
37	$C_6H_5CHOHCH{-}CH_2{-}CH$ / $NH{-}CH_2{-}CH_2$ Phenyl *2* piperidyl carbinol	3	10
38	$C_6H_5CHOHCH{-}CH{-}CH_2$ / $CH_2{-}NH{-}CH_2$ Phenyl *3* piperidyl carbinol	10	20
39	$C_6H_5CHOHCH{-}CH{-}CH_2$ / $CH_2{-}CH{-}NH$ Phenyl *4* piperidyl carbinol	10	10
40	NH—CO / C_6H_4N C $CH_2CH_2NH_2$ / C CH_2 *2* Phenyl *3* methyl *5* pyrazolone *4* ethylamine	18	30

Average of three experiments

first a fall and then a rise of blood sugar Five minutes after injection, a fall of 9 mg occurred At the end of 30 minutes the blood sugar returned to its initial level, following which a rise occurred for the next 30 minutes No 5, a secondary amine, related to No 4 with a butyl group replacing one H on the N atom, gave a rise of 39 mg This agrees with the observations on other compounds of similar structure, that is, increase in the number of C atoms attached to the N atom appears to increase the hyperglycemic action No 6, the *dl*-product synthesized by Hartung, and No 7, the *d*-form isolated from Ma Huang by Smith (12), differ from No 4 in that a CH_3 group is attached to the α-C atom The natural product produced slightly greater rise, 17 mg as against No 6 which caused a rise of 12 mg Methylation on the α-C atom apparently has little influence on the hyperglycemic action since Nos 4, 6 and 7 are nearly the same

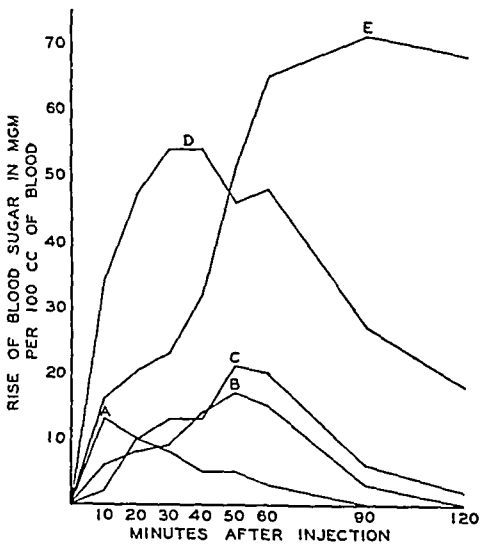

Fig 1 —Comparison of Hyperglycemic Action of 5 Homologs

A C_6H_5 CHOH $CHCH_3$ $NHCH_3$ 1 cc $M/10$ Solution B C_6H_5 CHOH $CHCH_3$ NHC_2H_5, 1 cc $M/10$ Solution C C_6H_5 CHOH $CHCH_3$ NHC_3H_7, 1 cc $M/10$ Solution D C_6H_5-CHOH $CHCH_3$ NHC_4H_9 1 cc $M/10$ Solution E C_6H_5 CHOH $CHCH_3$ NH CH_2 C_6H_5, 1 cc $M/10$ Solution

Compounds numbered 8 to 13, inclusive, are the six optical isomers of ephedrine Their order of activity on blood sugar is as follows No 9 < No 11 < No 12 < No 8 < No 10 < No 13, the last producing a rise three times that of the first *l*-Ephedrine, No 9, has the least hyperglycemic action Chen, Wu and Henriksen (8) showed that the relation in pressor action was No 13 < No 11 < No 12 < No 10 < No 8 < No 9, No 9 being 35 times as strong as No 13 Obviously, there is no correlation between the pressor and hyperglycemic actions in the optical isomers of ephedrine No 14, the *l*-methyl ephedrine isolated from Ma Huang by Smith (13), was found to be practically the same as *l*-ephedrine and *dl*-pseudoephedrine

Compounds numbered 15, 17, 18, 19, 20, 21 and 22 differ from each other in the number of C atoms attached to the N atom (Table I) No 15, the ethyl derivative, is slightly stronger than the methyl derivative (No 9, ephedrine) The *n*-propyl derivative, No 17, is stronger than the iso-propyl derivative, No 18, and both in turn are stronger than the ethyl compound, No 15 The butyl derivative, No 19, produced a rise of 54 mg and the amyl derivative, No 20, showed a 40-mg rise However, only half the usual dose for No 20 was given due to its high toxicity With the addition of a benzene ring on the N atom, a further rise was observed No 21 caused a rise of 71 mg , and No 22 a rise of 45 mg Half the dosage was also used for No 22 It appears that the hyperglycemic action increases as the number of C atoms attached to the N atom increases, as well illustrated in Fig 1 This is contrary to

the pressor action, for Chen, Wu and Henriksen (8) showed that the pressor action decreases as the side chain on the N atom lengthens However, when the number of C atoms linked with the α-C atom is increased, no augmentation of the hyperglycemic action occurs since Nos 23 and 24 produced the same effect

3 COMPOUNDS OF FORMULA [III]

Compounds numbered 25, 26, 27, 28, 29, 30, 31 and 32 are all derivatives of the general formula,  The first five possess

an OH, CH_3 or CH_3O group in the para position, while the remaining three have OH groups in both the para and meta positions It is difficult to say what influence a single phenolic OH exerts in a compound, for No 25 is weaker than No 3, but in contrast to this, No 27 is stronger than No 6 (Table I) The introduction of a methyl radicle to the para position seems to increase the hyperglycemic activity while a methoxy group seems to decrease it However, only one example of each was investigated

Owing to the fact that epinephrine is a potent substance, its dose was reduced to 0 1 cc of a 1 1000 solution which represents approximately $^1/_{200}$ of the average amount of the preceding compounds administered Epinephrine injected intravenously produced a rise of 55 mg per 100 cc Compounds numbered 31 and 32 resemble epinephrine in that they both have two OH groups in the para and meta positions Like epinephrine, they have a high pressor action (10) With No 31, a maximal rise of 45 mg of blood sugar was observed following the intravenous injection of 1 cc of 1 1000 solution No 32 in the dosage of 1 cc of a 1 500 solution caused a rise of 37 mg , reaching its peak in 50 minutes It is here that the rise of blood sugar qualitatively follows the pressor action

TABLE II —COMPOUNDS STUDIED BY SUBCUTANEOUS INJECTION

Compound	Approximate Dose Mg per Kg	Rise in Blood Sugar Intravenous	Subcutaneous
l Ephedrine	20	13	0
Sympatol	20	35	0
Trimethyl tryptamine quaternary ammonium iodide	33	50	0
l Epinephrine	0 1	55	55
3 4 Dihydroxy-*nor* ephedrine	1 0	45	32
3,4 Dihydroxy-ephedrine	2 0	37	90

4 ADDITIONAL COMPOUNDS STUDIED

Of the simpler indole derivatives, the order of activity on blood sugar is dimethyl-tryptamine > methyl-tryptamine > tryptamine In pressor action, the reverse is true (10) Trimethyl-tryptamine quaternary ammonium iodide, No 36, was given in doses of 1 cc of $M/40$ solution An average rise of 50 mg was noted The pressor action in this case is also greater than other tryptamines (10) The

first a fall and then a rise of blood sugar Five minutes after injection, a fall of 9 mg occurred At the end of 30 minutes the blood sugar returned to its initial level, following which a rise occurred for the next 30 minutes No 5, a secondary amine, related to No 4 with a butyl group replacing one H on the N atom, gave a rise of 39 mg This agrees with the observations on other compounds of similar structure, that is, increase in the number of C atoms attached to the N atom appears to increase the hyperglycemic action No 6, the *dl*-product synthesized by Hartung, and No 7, the *d*-form isolated from Ma Huang by Smith (12), differ from No 4 in that a CH_3 group is attached to the α-C atom The natural product produced slightly greater rise, 17 mg as against No 6 which caused a rise of 12 mg Methylation on the α-C atom apparently has little influence on the hyperglycemic action since Nos 4, 6 and 7 are nearly the same

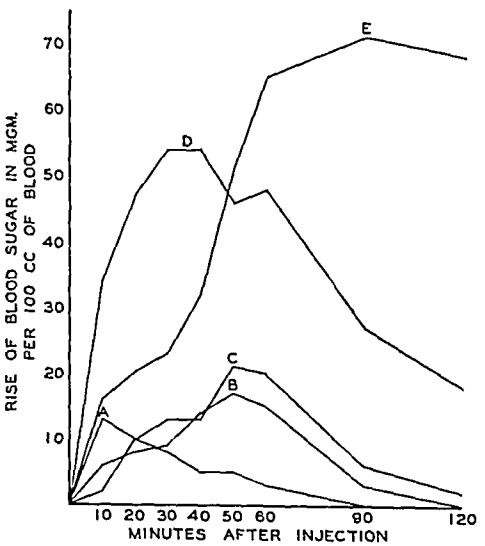

Fig 1 —Comparison of Hyperglycemic Action of 5 Homologs

A C_6H_5 CHOH $CHCH_3$ $NHCH_3$, 1 cc $M/10$ Solution B C_6H_5 CHOH $CHCH_3$ NHC_2H_5, 1 cc $M/10$ Solution C C_6H_5 CHOH $CHCH_3$ NHC_3H_7, 1 cc $M/10$ Solution D C_6H_5-CHOH $CHCH_3$ NHC_4H_9 1 cc $M/10$ Solution E C_6H_5 CHOH $CHCH_3$ NH CH_2 C_6H_5, 1 cc $M/10$ Solution

Compounds numbered 8 to 13, inclusive, are the six optical isomers of ephedrine Their order of activity on blood sugar is as follows No 9 < No 11 < No 12 < No 8 < No 10 < No 13, the last producing a rise three times that of the first *l*-Ephedrine, No 9, has the least hyperglycemic action Chen, Wu and Henriksen (8) showed that the relation in pressor action was No 13 < No 11 < No 12 < No 10 < No 8 < No 9, No 9 being 35 times as strong as No 13 Obviously, there is no correlation between the pressor and hyperglycemic actions in the optical isomers of ephedrine No 14, the *l*-methyl ephedrine isolated from Ma Huang by Smith (13), was found to be practically the same as *l*-ephedrine and *dl*-pseudoephedrine

Compounds numbered 15, 17, 18, 19, 20, 21 and 22 differ from each other in the number of C atoms attached to the N atom (Table I) No 15, the ethyl derivative, is slightly stronger than the methyl derivative (No 9, ephedrine) The *n*-propyl derivative, No 17, is stronger than the iso-propyl derivative, No 18, and both in turn are stronger than the ethyl compound, No 15 The butyl derivative, No 19, produced a rise of 54 mg and the amyl derivative, No 20, showed a 40-mg rise However, only half the usual dose for No 20 was given due to its high toxicity With the addition of a benzene ring on the N atom, a further rise was observed No 21 caused a rise of 71 mg , and No 22 a rise of 45 mg Half the dosage was also used for No 22 It appears that the hyperglycemic action increases as the number of C atoms attached to the N atom increases, as well illustrated in Fig 1 This is contrary to

the pressor action, for Chen, Wu and Henriksen (8) showed that the pressor action decreases as the side chain on the N atom lengthens However, when the number of C atoms linked with the α-C atom is increased, no augmentation of the hyperglycemic action occurs since Nos 23 and 24 produced the same effect

3 COMPOUNDS OF FORMULA [III]

Compounds numbered 25, 26, 27, 28, 29, 30, 31 and 32 are all derivatives of the general formula,  The first five possess

an OH, CH_3 or CH_3O group in the para position, while the remaining three have OH groups in both the para and meta positions It is difficult to say what influence a single phenolic OH exerts in a compound, for No 25 is weaker than No 3, but in contrast to this, No 27 is stronger than No 6 (Table I) The introduction of a methyl radicle to the para position seems to increase the hyperglycemic activity while a methoxy group seems to decrease it However, only one example of each was investigated

Owing to the fact that epinephrine is a potent substance, its dose was reduced to 0 1 cc of a 1 1000 solution which represents approximately $^1/_{200}$ of the average amount of the preceding compounds administered Epinephrine injected intravenously produced a rise of 55 mg per 100 cc Compounds numbered 31 and 32 resemble epinephrine in that they both have two OH groups in the para and meta positions Like epinephrine, they have a high pressor action (10) With No 31, a maximal rise of 45 mg of blood sugar was observed following the intravenous injection of 1 cc of 1 1000 solution No 32 in the dosage of 1 cc of a 1 500 solution caused a rise of 37 mg , reaching its peak in 50 minutes It is here that the rise of blood sugar qualitatively follows the pressor action

TABLE II —COMPOUNDS STUDIED BY SUBCUTANEOUS INJECTION

Compound	Approximate Dose Mg per Kg	Rise in Blood Sugar Intravenous	Subcutaneous
l Ephedrine	20	13	0
Sympatol	20	35	0
Trimethyl tryptamine quaternary ammonium iodide	33	50	0
l-Epinephrine	0 1	55	55
3,4-Dihydroxy-*nor* ephedrine	1 0	45	32
3,4 Dihydroxy ephedrine	2 0	37	90

4 ADDITIONAL COMPOUNDS STUDIED

Of the simpler indole derivatives, the order of activity on blood sugar is dimethyl-tryptamine > methyl-tryptamine > tryptamine In pressor action, the reverse is true (10) Trimethyl-tryptamine quaternary ammonium iodide, No 36, was given in doses of 1 cc of $M/40$ solution An average rise of 50 mg was noted The pressor action in this case is also greater than other tryptamines (10) The

three phenyl-piperidyl carbinols and the pyrazolone, No 40, all caused a slight elevation of blood sugar

5 SIX COMPOUNDS STUDIED SUBCUTANEOUSLY

Compounds numbered 9, 26, 30, 31, 32 and 36 were also studied following the subcutaneous injection The dosage employed was the same as that used for intravenous administration As shown in Table II, ephedrine, sympatol and trimethyl-tryptamine quaternary ammonium iodide failed to show any hyperglycemic action upon the subcutaneous injection With epinephrine and its two homologs (Nos 31 and 32), however, a distinct rise of blood sugar was observed There was practically no difference between the intravenous and subcutaneous injections of epinephrine *3,4*-Dihydroxy-*nor*-ephedrine is less effective by subcutaneous injection, but *3,4*-dihydroxy-ephedrine, on the other hand, is more than twice as active as by intravenous administration

DISCUSSION

There are few generalizations that can be made concerning the relationship between the hyperglycemic action and chemical structure Two primary amines are stronger than two corresponding secondary amines, and two vice versa Methylation of a compound may therefore increase or decrease the power to raise blood sugar The lengthening of the side chain attached to the N atom is accompanied by an increase of the hyperglycemic action The introduction of an OH group at the para position may result in an augmentation or reduction of the sugar raising property When a compound has a structure closely similar to that of epinephrine, such as *3,4*-dihydroxy-ephedrine and *-nor*-ephedrines, the activity is at once increased Furthermore, they become effective in influencing the blood sugar by either intravenous or subcutaneous injections

It is evident that there is little correlation between the hyperglycemic and pressor actions, in fact, they are often diametrically opposite For example, the pressor action diminishes and finally disappears as the length of the side chain of the N atom increases, while the reverse is true regarding the hyperglycemic effect The order of the pressor activity of the six optical isomers of ephedrine has been found to be *l-* > *dl-* > *d-* > *d-ψ* > *dl-ψ* > *l-ψ* On the other hand, their action on the blood sugar is almost in reverse ratio *l-ψ* > *d-* > *d-ψ* or *dl-* > *dl-ψ* > *l-* The rise of blood sugar becomes highest when the structure of the compound approaches that of epinephrine Even in this case the resemblance is merely qualitative It may be interesting to point out here that only epinephrine and its close homologs raise blood sugar by subcutaneous injection

SUMMARY

A series of forty compounds has been studied for their hyperglycemic action Most of them are derivatives of one of three formulas

1 $C_6H_5\,CH_2\,NHR$

2 $C_6H_5\,CHH^1\,CHR\,NR^1R'$

3  $CHH^1\,CHR^1\,NHR$

wherein R, R^1 and R^2 = H or alkyl group, H^2 = H, OH, alkyl or alkyloxy, and H^1 and H^3 = H or OH Four derivatives of indolethylamine, three those of phenyl-piperidyl-carbinols, and one that of phenyl-pyrazolone complete the list of substances investigated

With an increase in the number of C atoms in R, R^1 and R^2, the hyperglycemic action increases

There is little correlation between the pressor action and hyperglycemic action as the chemical structure varies They are often diametrically opposite

When the structure of a compound approaches that of epinephrine, a small amount will be necessary to cause a distinct response of hyperglycemia The epinephrine homologs also raise blood sugar by subcutaneous injection

LILLY RESEARCH LABORATORIES INDIANAPOLIS

PANCREATIN AND ITS ASSAY *

BY F E WILLSON

The U S P X has definite standards for the trypsin and amylase content of pancreatin The B P 1932, also, has definite standards for these two enzymes in pancreatin and in addition has a standard for lipase content The methods of determining tryptic and amylase content differ materially in the two pharmacopœias and also the standards set do not compare very closely For this reason it is interesting to compare the different methods and observe some of the difficulties met with

The U S P Trypsin Method—According to the U S P X trypsin test, pancreatin should convert not less than twenty-five times its weight of casein into soluble proteoses Therefore in this particular assay casein is used as the substrate The actual method employed is essentially that known as the Fuld-Gross (1), (2) A 0 2% solution of casein is prepared by the use of sodium hydroxide A definite quantity of a solution of the pancreatin to be tested is added to a definite quantity of the casein solution Digestion is allowed to proceed for one hour's time, after

* Scientific Section A PH A Madison meeting 1933

which the degree of digestion of the casein is determined by the addition of an alcohol-acetic acid mixture (U S P X, page 275)

This particular method has been the cause of considerable criticism and controversy among those concerned with the evaluation of pancreatin The cause of variations in results obtained in carrying out this test is chiefly accounted for by the indefiniteness of the end point This particular difficulty was pointed out in an earlier paper (3)

Another source of variance in results may be found in the sample of powdered casein used for the substrate There is a considerable difference in the various caseins on the market A number of samples we have tested failed to give a clear solution in an alkaline solution They are therefore unsuitable for use Also several samples of casein examined have had a decided alkalinity which also would make them unsuitable for the U S P test, since a more definite hydrogen-ion concentration is necessary Furthermore with the casein supply there is a possibility of variance in moisture content of the different lots of casein

Still another point that should be observed in carrying out trypsin assays is that the pancreatin to be tested should be left in contact with water for at least one hour before test if the full tryptic activity is to be obtained

From these difficulties pointed out it will be observed that the present U S P method is not an entirely satisfactory method

The B P Trypsin Method—The B P 1932 employs a modification of the Smith-Sorenson method (4) for determining the tryptic activity Fresh milk from which the cream has been removed is used as the substrate In other words, fresh milk furnishes the casein supply To ensure a constant amount of casein being present, directions are given for adjustment The milk solution is also adjusted to a definite p_H after which the pancreatin solution is added and the digestion allowed to proceed for one and a half hours at 38° to 40° C At the end of this time the digestion mixture is rapidly cooled to 20° C and a formol titration carried out by which the amino acids formed during the digestion are titrated A blank is run on the milk and a boiled sample of pancreatin for correction purposes Definite limits have been adopted in terms of $N/20$ sodium hydroxide solution for pancreatin to meet this tryptic standard

The method, in general, seems quite satisfactory for use Many factors which enter into the U S P method are eliminated in this method Furthermore, a definite end-point is obtained which cannot be interpreted differently by various operators

There are several points in the B P method which may give a considerable variance in results The first and most serious objection to the test is the use of fresh milk as the substrate The opinion is expressed that milk does not furnish a substrate that is constant enough in composition to give perfectly satisfactory results This is true even though the adjustments directed by the B P are carried out The difference in the milk supply in different parts of the country was demonstrated during certain cooperative work carried out on rennin Quite different results were obtained depending upon the section of the country the tests were carried out in and also in the source and processing the milk had gone through This apparently was due to differences in the composition of the milk The same conditions, it would seem, will apply to the B P test Carrying out the test in

different parts of the country or even different seasons of the year are liable to give quite different results This could be avoided by the use of powdered casein of specified purity which would have supplied a substrate of constant composition and would not have required the adjustment that the milk does before use

The Modified Smith-Sorensen Test—It has been pointed out that the present U S P method of determining trypsin is far from satisfactory The question then arises, how can the present method be improved or what methods are available for substitution? In our opinion the present method should be discarded and a new one substituted In a previous paper (5) a modification of the Smith-Sorensen test was suggested Since that time considerable work has been done on it in this laboratory as well as other laboratories The results so far obtained indicate the method is satisfactory and at the same time not liable to the various sources of error that the present U S P method contains The method previously suggested has not been changed with the exception of a few minor points

The adjustment of the p_H of the casein solution has been a troublesome problem in working out this method At first a combination of phenolphthalein and brom-thymol blue was used This was not entirely satisfactory so after considerable experimentation an aqueous solution of cresol red seemed most suitable To give some idea of the different results obtained with different indicators two solutions of casein were prepared One was prepared to have a p_H of not more than 8 0 while the other was prepared to have a p_H greater than 8 0 The following table gives the results obtained with various indicators

Indicator	Solution I	Solution II
Cresol Red (aqueous)	7 6	8 8
Brom Thymol Blue (alcoholic)	6 9	7 7
Phenol Red (alcoholic)	No comparison possible	
Phenol Red B P (alcoholic)		
Phenol Red (aqueous)	8 0+	8 4+
Thymol Blue		8 40
By potentiometer (quinhydrone electrode)	7 54	8 65

In determining the p_H with the various indicators the Hellige Hydrogen-Ion Comparator with the standard discs supplied for each indicator was used

From the above table it will be observed that with both solutions the p_H obtained using an aqueous solution of cresol red approximated very closely the p_H obtained by potentiometric means

Phenol red proved to be entirely unsatisfactory The difficulty seemed to lie in the fact that the casein solution apparently absorbs some of the color of the indicator which gives a resulting color that does not compare with the comparison standard This color change seems to be more pronounced with alcoholic solutions of phenol red than aqueous solutions of the indicator

A change is suggested in the strength of the alkali to be used for titration in the Modified Smith-Sorensen method A $N/10$ sodium hydroxide was previously suggested Since then a $N/20$ sodium hydroxide solution has been used during certain cooperative work carried on Lately, we have used $N/50$ sodium hydroxide which has the advantage of giving a greater volume required for neutralization and in this way reducing the experimental error Another advantage of including $N/50$ alkali would be that the method would be more available for U S P inclusion

if it were looked upon favorably A $N/50$ sodium hydroxide is official while a $N/20$ sodium hydroxide is not

Another point in which the proposed method could be improved upon for inclusion in the U S P would be in regard to the temperature of digestion The present method suggests a temperature of 55° C This is the temperature used in the original Smith Sorensen method A temperature of 52° C would be more suitable if the method were to be included in the next U S P The reason for this is that most laboratories carrying out enzyme assays according to the present U S P directions have a water bath regulated at 52° C for pepsin assays Therefore if the temperature of digestion for this tryptic activity method were changed to 52° C the same bath would be available for carrying out the digestion This, however, would be a matter for further investigation

The standard given for computing the tryptic activity of pancreatin samples using this method is a more or less arbitrary one based to some extent on the present U S P standard A sample that digests 25 times its own weight of casein into soluble proteoses should require on the Modified Smith-Sorensen method approximately 5 0 cc of $N/50$ sodium hydroxide

The feeling is expressed that using the proposed method for assay of tryptic activity a more satisfactory method of determination would be available with less divergent results being obtained by different workers

COMPARISON OF RESULTS BY THE U S P, B P AND MODIFIED SMITH-SORENSEN METHODS

Having considered these three methods it is of interest to see how they compare as far as actual results are concerned Five samples of pancreatin labeled U S P were procured on the market at the same time They were all carefully assayed according to each method and the results expressed in terms of percentage of the standard adopted for each test The results are as follows

T	U S P Method	B P Method	Smith-Sorensen Method
Sample A	150%	256%	160%
Sample B	220%	296%	226%
Sample C	210%	231%	234%
Sample D	105%	244%	122%
Sample E	220%	343%	234%

From these results it will be observed that with the exception of two samples the others are at least twice as strong as the U S P requirements This is not entirely surprising since the method of manufacture and the resulting activity will be controlling factors Since there are two standards to be met by the U S P, the samples of pancreatin must be put on the market according to the lowest of the two activities shown to meet the U S P standard This is to say, it would be almost impossible to market a sample of pancreatin assaying exactly the U S P requirements by both the tryptic standard and the amylase standard

The B P standard seems a little lower than the present U S P standard From the results on the above samples no satisfactory conclusions can be obtained as to the ratio In some cases the ratio is relatively large, whereas with Sample C the ratio is very small The one conclusion that can be drawn, however, is that

pancreatin samples meeting the U S P standard for trypsin will also meet the B P standard for this same activity

The U S P Amylase Assay—The U S P X states that pancreatin should convert not less than twenty-five times it weight of starch into soluble carbohydrates In carrying out this particular assay a 3 75% starch paste is used and digestion is allowed to proceed 5 minutes with the pancreatin solution The completeness of digestion is determined by adding a definite amount of the digestion mixture to a dilute iodine solution If no color is produced the pancreatin meets the U S P specification for amylase

This U S P method is for the most part satisfactory but there are a few points in it that may cause differences in results One of the most important of these points concerns the preparation of the starch to be used for test Detailed instructions are given by the U S P for the starch to be used It amounts to this, that ordinary potato starch is thoroughly washed with distilled water and dried The moisture content is then determined and the starch used on the dry basis for the preparation of the 3 75% paste If the U S P method of washing is carried out and the washed starch dried slowly by a gradual raising of temperature of 50° C, there seems to be less difference in results than if ordinary purified potato starch is used However, if the washed starch is immediately subjected to a temperature of 50° C and maintained at this temperature until the greater part of the moisture is driven off, there seems to be a hardening action of some sort on the starch granules Using starch dried in this manner invariably gives lower results of amylolytic power than when starch dried gradually or not subjected at all to washing and drying is used There seems very little necessity of going through this washing with subsequent drying if the starch to be used has a neutral reaction Most of the potato starch of commerce, to-day, is a highly purified product

Another point in regard to the starch is the method of determining the moisture content The moisture content is directed to be carried out by heating four hours at a temperature of 120° C In determining the moisture content in this manner, with many samples of starch it has been a subject of some doubt as to whether the actual moisture content was being determined With a number of samples, some caramelization has taken place when subjected to this temperature It would appear that a more satisfactory method would be to dry at 100° C possibly for a considerably greater length of time Investigation has shown that caramelization does not take place at this temperature

The U S P directs that the equivalent amount of starch to make a 3 75% paste is mixed with boiling water and boiled for approximately 5 minutes In preparing a starch paste in this manner, many times a satisfactory paste is not obtained The paste produced is invariably quite thick in consistency and often very "lumpy" This increases the chance of using a paste that is not exactly 3 75% starch This can be overcome and avoided by heating water to between 50° and 60° C and then adding a water suspension of the starch with constant stirring The starch mixture is then brought to boiling and boiled for 5 minutes and finally adjusted to weight In this way a perfectly homogeneous starch paste can be prepared which is much thinner in consistency than one prepared according to U S P directions This difference in consistency makes it much easier to handle and weigh out for test

The end-point obtained also is often a matter of doubt This phase of the amylase test was, however, quite fully dealt with in an earlier paper (3)

The B P Amylase Assay—The B P amylase test differs somewhat from the U S P test Instead of using ordinary potato starch, soluble starch is employed A 1% solution of this soluble starch with 5% of sodium chloride is used in place of 3 75% starch paste The test is carried out on a small quantity of this starch solution as compared to the U S P method of using 200 Gm of the paste The digestion is carried out for one hour at 40° C instead of the U S P time of five minutes at 40° C At the end of the digestion period the tubes are rapidly cooled to 20° C and *N*/50 iodine solution added directly to the digestion tubes instead of withdrawing a definite amount and adding it to iodine solution as is the case with the U S P method

There is one serious objection to this B P method The quantities of pancreatin used for tests are too small For instance, a series ranging from 0 35 cc to 0 65 cc using 0 05-cc intervals are directed to be used for tests These quantities are much too small to warrant accurate results, especially when dealing with enzymes

The use of soluble starch as the substrate appears to be a good one The chance that a homogeneous mixture will not be obtained is very remote However, no mention of moisture content of the soluble starch is made which may cause some variance in results

The use of sodium chloride in making the starch solution is probably an unwise choice in one respect It has been proven that sodium chloride is an activator for pancreatic amylase Therefore the results obtained may be higher than the absolute activity of the enzyme

Another interesting point in the B P directions is that on the addition of the iodine solution to the digested mixtures, the end-point in the series is that tube showing no blue color In other words, they take as their end-point simply the complete conversion of the starch present In the U S P method the starch must be converted down through the various dextrins to the sugars It is the dextrins that give the red and purple colors with iodine solution that the U S P directs must not be present

COMPARISON OF U S P AND B P AMYLASE ASSAYS

Some idea of how the U S P and B P assay results compare can be gained from results obtained on the five samples of U S P samples which were mentioned in dealing with trypsin activity The results are as follows

	U S P Assay	B P Assay
Sample A	100%	900%
Sample B	45%	500%
Sample C	8%	110%
Sample D	80%	800%
Sample E	75%	720%

In expressing the above results a pancreatin converting 25 times its weight of starch into soluble carbohydrates was expressed as being 100%

A similar method was used for expressing the B P results Therefore in stating a sample is 900% by the B P what is meant is that the sample is 9 times the strength allowed by the B P

In looking over the above results it is interesting to note that though all five samples were labeled U S P there is only one sample that actually meets the U S P specifications This does not, however, mean that the above samples were put on the market below the U S P specifications It is simply a case of dealing with an enzyme of unstable activity The instability of pancreatic amylase is a point to which very little attention has been paid up to the present time Whether this particular instability applies to the liquefying power as well as the starch conversion power of pancreatic amylase is an open question, it seems, at the present time From observations made, the liquefying power does not necessarily parallel the starch conversion power This particular point is being investigated, further, with pancreatic amylase and amylases from other sources at the present time

From the table of results given it will also be observed that the U S P standard is about 10 times that of the B P standard This is not surprising since it has already been pointed out that the B P specifications do not require the digestion to proceed down through the dextrin stage Therefore much higher results could be expected in relation to the U S P method

The difficulties experienced with the amylase test of the present U S P is a problem to which very little attention has been paid up to the present time How to improve upon or change the method is a matter of opinion In the first place we feel that very few pancreatin samples on the market for any length of time will meet the U S P specifications As already pointed out this is a matter of loss of activity

In regard to the end-point used in the present U S P method it is quite liable to variance Possibly a modification of the Fehling's solution method would prove more satisfactory as an end-point and at the same time be more accurate for the specification desired by the U S P, *i e*, conversion into "soluble carbohydrates"

The B P Lipase Assay—The B P, as already stated, has a definite standard for lipase content The U S P has up to the present time made no attempt to standardize pancreatin on this basis The B P method for determination of lipase, utilizing the cream from fresh milk, is a very ingenious one and from the brief experience with it seems quite satisfactory It is much simpler than any of the other lipase methods available and at the same time gives a very definite end-point The results obtained on the five samples of U S P Pancreatin used throughout the comparison of these different methods give the following results by the B P method

	B P Lipase.
Sample A	129%
Sample B	107%
Sample C	63%
Sample D	100%
Sample E	83%

From these above results it will be observed that three meet the B P specifications while two are below the specifications

SUMMARY

1 The U S P, B P and Modified Smith-Sorensen assay methods for trypsin are discussed and the results by each method compared

2 Certain changes are suggested for improving the Modified Smith-Sorensen method

3 The U S P and B P Amylase assay methods are discussed and compared

4 Results of lipase content by the B P method are given for five samples of Pancreatin U S P X examined

THE DETERMINATION OF STRYCHNINE AND BRUCINE AS HYDRO FERROCYANIDES AND THEIR SEPARATION BY MEANS OF FERROCYANIDE *

BY I M KOLTHOFF AND J J LINGANE

The usual procedure for the separation of strychnine from brucine is based on the fact that brucine is fairly easily destroyed by treatment with nitric acid In the present work it was found that this method yields approximate results only, either the brucine is not completely destroyed or on more drastic treatment part of the strychnine is decomposed also Therefore a more exact method would be of value It is known that ferrocyanide in acid medium gives slightly soluble crystalline hydroferrocyanides with strychnine and brucine, the former crystallizes much faster and is less soluble than the latter Beckurts and Holtz[1] made use of this difference in behavior and titrated a strongly acid solution of the mixed alkaloids with standard potassium ferrocyanide, using ferric chloride test paper as an outside indicator The success of the method depends on the slowness with which brucine is precipitated by the slight excess of ferrocyanide after the precipitation of strychnine is complete The detection of the end-point, however, is not very sharp, after much practice an accuracy of about 5% could be obtained

Gadreau[2] proposed a much more complicated method He precipitates the strychnine and part of the brucine by addition of a large excess of ferrocyanide in weakly acid medium The precipitate is treated with an excess of ammonia and the free alkaloids are extracted with chloroform After evaporation of the solvent the alkaloids are dissolved in 0 1*N* hydrochloric acid and the precipitation with ferrocyanide repeated as before The process is repeated three times and the final precipitate of strychnine hydroferrocyanide weighed after drying over sulphuric acid and finally in an oven

[2] Gadreau *J pharm chim* [6] 4 (1927) 145

In this study the properties of strychnine and brucine hydroferrocyanide have been investigated and a simple procedure developed for the determination of strychnine in the presence of brucine

MATERIALS USED

Brucine Hydrochloride—Commercial brucine was dissolved in chloroform and treated with gaseous hydrochloric acid The hydrochloride was allowed to crystallize and was recrystallized from alcohol containing 20% acetone The aqueous solution of the salt was standardized by gravimetric chloride determinations In other experiments a solution of the salt was obtained by dissolving a known amount of brucine recrystallized from acetone and alcohol in a slight excess of hydrochloric acid

Strychnine Sulphate—A Merck & Company product was used without further purification It appeared to be the normal salt *i e* containing one molecule of strychnine per one molecule of sulphuric acid The aqueous solution was standardized by titration with sodium hydroxide, using methyl red as indicator In addition the sulphate was determined gravimetrically as barium sulphate, the results obtained in the two methods agreed within 0 2% and were 0 4% lower than those calculated from the weight of the salt taken assuming the latter to be pure

Potassium Ferrocyanide—A C P product was twice recrystallized from water and dried over deliquescent sodium bromide Solutions of this salt in conductivity water were used and stabilized by the addition of 0 2% of sodium carbonate

COMPOSITION OF THE HYDROFERROCYANIDES OF STRYCHNINE AND BRUCINE

The hydroferrocyanides of both alkaloids were prepared by precipitation from strongly acid medium (*v i*) with an excess of potassium ferrocyanide The precipitates were washed with water and air dried The water content was determined by heating 0 5- to 0 8 Gm samples in a vacuum oven at 60° until constant weight was obtained Upon continued drying at 110° no further loss in weight was found with the strychnine hydroferrocyanide It is not recommended to heat the air-dry precipitates directly at 110°, since a decomposition, especially of the brucine compound, takes place The hydroferrocyanide content of the precipitates was determined by titration of the aqueous suspensions with sodium hydroxide, using methyl red as indicator The results showed that the air-dry hydroferrocyanides have the following composition

$C_{21}H_{22}N_2O_2\ H_4Fe(CN)_6\ 1\ H_2O$ M = 568 1
strychnine hydroferrocyanide

$C_{23}H_{26}N_2O_4\ H_4Fe(CN)_6\ 2\ H_2O$ M = 646 2
brucine hydroferrocyanide

W M Cumming[1] reports a similar composition, but with two molecules of water of crystallization for the strychnine salt instead of one However, four water determinations made by us yielded a water content between 3 1 and 3 5% (theoretical for 1 H_2O, 3 17%, for 2 H_2O, 6 15%)

SENSITIVITY OF THE PRECIPITATION OF STRYCHNINE AND BRUCINE

The sensitivity is greatly dependent upon the acid concentration and to a lesser extent on the ferrocyanide content The original precipitates are white, but the brucine hydroferrocyanide turns green on standing over night in acid medium In the final procedure 1 cc 0 5 molar potassium ferrocyanide was added to 10-cc solution of the alkaloid salt containing the indicated amount of hydro-

[1] W M Cumming *J Soc Chem Ind*, 44 (1925), 110T

chloric acid The results are given in Table I It is seen that the sensitivity of the precipitation of strychnine in 0 1 to 0 5*N* hydrochloric acid is much larger than that of brucine At these acidities 0 07-mg strychnine can be detected in 10 cc of solution if observed after 30 minutes of standing The precipitation of this alkaloid, therefore, is quantitative The sensitivity of the precipitation of brucine is the greatest in 3*N* hydrochloric acid After 10 minutes of standing 3 mg of brucine in 10 cc of solution can be detected The data in the table also indicate that the precipitation of strychnine is much faster than that of brucine

TABLE I —SENSITIVITY OF PRECIPITATION OF STRYCHNINE AND BRUCINE

Concentration HCl *N*	Concentration Strychnine Moles p l	Result	Concentration Brucine Moles p l	Result
0	0 01	Trace ppt after 1 hr	0 02	No ppt after 2 hours

3			0 0008	Ppt after 5 minutes
3			0 0006	No ppt after 24 hours

SOLUBILITY OF STRYCHNINE AND BRUCINE HYDROFERROCYANIDES

The solubility was determined by shaking a known weight of the salt for 45 minutes with a known volume of solvent Longer shaking is not desirable since decomposition may take place The solid was collected and washed quickly with small portions of alcohol and ether, and weighed after 20 minutes' drying in the air

TABLE II —SOLUBILITY OF STRYCHNINE AND BRUCINE HYDROFERROCYANIDE (TEMPERATURE 25° ± 2°)

Solvent	Strychnine Hydroferrocyanide Dissolved Mg per 100 Cc	Brucine Hydroferrocyanide Dissolved Mg per 100 Cc
Water	36	237
0 1*N* HCl	3 7	52
1*N* HCl		50[a]
3*N* HCl	4 2	78

[a] Temperature was 21°

GRAVIMETRIC AND VOLUMETRIC DETERMINATION OF STRYCHNINE AS HYDROFERROCYANIDE

Procedure —To a measured volume of the strychnine solution water and so much hydrochloric acid is added that the concentration is 0 1 to 1*N* in a final volume of 100 cc Five cc 0 5 molar potassium ferrocyanide are added slowly from a pipette resulting in the rapid formation of a nicely crystalline precipitate After 30 minutes of standing and occasional stirring the precipitate is filtered on a sintered glass crucible (1 G –4), washed 5 to 6 times with approximately 0 1*N* hydrochloric acid, followed by two or three washings with alcohol and two or three washings with ether Air is aspirated through for a few minutes and the crucible weighed after 20–30 minutes' standing in the air The strychnine hydroferrocyanide $C_{21}H_{22}N_2O_2\ H_4Fe(CN)_6\ H_2O$ contains 58 83% strychnine

TABLE III —GRAVIMETRIC DETERMINATION OF STRYCHNINE

Strychnine Taken Gm	HCl N	Weight Ppt Gm	Strychnine Found Gm	Error %
0 3384[a]	0 1	0 5680	0 3342	−1 3
0 3384[a]	0 1	0 5673	0 3337	−1 4
0 3384	0 1	0 5764	0 3391	+0 2
0 3384	0 1	0 5756	0 3386	+0 05
0 3384	0 1	0 5760	0 3389	+0 1
0 3384	1	0 5767	0 3393	+0 3
0 1066	1	0 1813	0 1067	+0 1
0 0677	1	0 1150	0 0677	0 0

[a] Washed with water instead of 0 1*N* hydrochloric acid

Table III shows that the procedure gives excellent results The concentration of the strychnine in the last example in the table was only 0 002 molar and still the theoretical yield of precipitate was found

VOLUMETRIC DETERMINATION OF THE STRYCHNINE HYDROFERROCYANIDE

Since the gravimetric determination of strychnine is so extremely simple, there is not much use for a volumetric determination of the precipitate If very small quantities of strychnine have to be determined, a volumetric procedure may be of some advantage The strychnine hydroferrocyanide can be titrated with sodium hydroxide If methyl red is used as indicator, the end-point is determined by the following reaction

$$BH\ H_3Fe(CN)_6 + 3OH^- \longrightarrow BH^+ + Fe(CN)_6 \equiv + 3\ H_2O$$

The color change from red to yellow is not very sharp since strychnine is a relatively weak base and the fourth ionization constant of hydroferrocyanic acid is of the order of 10^{-4} Still the color change to yellow can be seen with an accuracy of 0 1 cc 0 05*N* base

The same procedure was followed as described for the gravimetric determination except that a Gooch crucible with a paper disc was used to collect the precipitate After washing with alcohol the precipitate and paper mat were transferred to a flask and treated with 50 cc of water and the suspension titrated with carbonate free sodium hydroxide, using methyl red as indicator The precipitate dissolves gradually as the titration proceeds 1 cc 0 1*N* sodium hydroxide is equivalent to 11 14 mg of strychnine The data in Table IV show that the results are about 1 to 3% low In the last example the concentration of the strychnine in the original solution was only 0 0008 molar

TABLE IV —VOLUMETRIC DETERMINATION OF THE PRECIPITATE

Strychnine Taken Gm	HCl N	0 052*N* NaOH Used Cc	Strychnine Found Gm	Error %
0 2714	1	44 91	0 2642	−2 7
0 2714	3	44 70	0 2630	−3 1
0 0678	1	11 38	0 0670	−1 2
0 0678	3	11 30	0 0665	−1 9
0 0271	1	4 38	0 0258	−4 8

GRAVIMETRIC DETERMINATION OF BRUCINE

The same procedure was followed as described for strychnine except that the acidity was 1 to 3*N* with respect to hydrochloric acid in the final volume, filtration

made after standing for at least one hour, and the precipitate quantitatively transferred to the crucible by means of the first filtrate If dilute hydrochloric acid is used for this purpose, the results are markedly low on account of solubility loss After the precipitate is transferred to the crucible, it is washed 2 to 3 times with 2- to 3-cc portions of 0 1*N* hydrochloric acid and finally with alcohol and ether The rate of precipitation of brucine is much slower than that of strychnine, in the examples given in the table precipitation began after a few minutes' vigorous stirring The results in Table V show that the determination of brucine as hydro ferrocyanide is not as accurate as that of strychnine

TABLE V —GRAVIMETRIC DETERMINATION OF BRUCINE

(0 1314 Gm brucine taken precipitate contains 61 00% brucine)

HCl *N*	Time before Filtration Hours	Weight Ppt Gm	Brucine Found Gm	Error %
3[a]	1/6	0 1994	0 1216	−7 5
3[a]	1	0 1997	0 1218	−7 3
1	1	0 2103	0 1283	−2 4
3	1	0 2120	0 1293	−1 6
1	20	0 2119	0 1293	−1 6
3	20	0 2108	0 1286	−2 1

[a] Precipitate transferred to crucible with 0 1*N* HCl instead of with filtrate

It may be mentioned that the results were 2 to 4% high if 25 to 50 cc of 0 5 molar ferrocyanide was used instead of 5 cc Coprecipitation of potassium does not account for these high results

DETERMINATION OF STRYCHNINE IN THE PRESENCE OF BRUCINE

Use has been made of the smaller solubility of strychnine hydroferrocyanide and its greater speed of precipitation as compared with the corresponding brucine compound in the separation of strychnine from brucine

SINGLE PRECIPITATION APPROXIMATE PROCEDURE

The mixture of the two alkaloids is diluted with water and hydrochloric acid to a volume of 50 cc and an acidity of 1 to 2*N* The solution is titrated with 0 025 molar potassium ferrocyanide until all of the strychnine has been precipitated as indicated by testing with ferric chloride paper This test is made by immersing a narrow, pointed strip of filter paper into the solution The end of the paper which has been dipped in the solution is then torn off and a drop of ferric chloride solution placed near the rim of the wet spot The indicator solution diffuses by capillary action and a bluish zone is formed at the junction in the presence of an excess of ferrocyanide The end-point is not very sharp, and its detection requires some practice, an excess of 0 5 to 0 6 cc of the ferrocyanide solution being required to make the color change visible The mixture is allowed to stand for 10 to 15 minutes The precipitate is then collected on a sintered glass crucible and further treated as described before in the gravimetric determination of strychnine

The results in Table VI show that the acidity of the solution may be varied between 1 and 3*N* and that 100 mg of strychnine can be determined in the presence

of the same amount of brucine with an accuracy of about 1 to 3% As a rule high results are found owing to precipitation of some brucine This error increases rapidly with increasing excess of ferrocyanide, for this reason it is safer to apply the double precipitation method as described below

TABLE VI —SINGLE PRECIPITATION OF STRYCHNINE IN THE PRESENCE OF BRUCINE

(0 1066 Gm strychnine taken in all experiments Titrated with 0 0238 molar $K_4Fe(CN)_6$ Theoretical amount of reagent required for complete precipitation of strychnine is 13 4 cc)

Brucine Present Gm	HCl N	$K_4Fe(CN)_6$ Added Cc	Time of Standing before Filtration Minutes	Weight Precipitate Gm	Strychnine Found Gm	Error %
0	1	14 0	5	0 1782	0 1048	−1 7
0	1	14 2	10	0 1782	0 1048	−1 7
0	1	14 2	15	0 1788	0 1052	−1 3
0 066	1	14 0	5	0 1782	0 1048	−1 7
0 066	1	14 2	15	0 1870	0 1100	+3 2
0 066	3	14 2	15	0 1853	0 1090	+2 3
0	3	14 2	15	0 1794	0 1056	−0 9
0 131	3	14 2	15	0 1838	0 1081	+1 4
0 131	3	14 2	15	0 1864	0 1097	+2 9
0 131	3	15 0	15	0 1905	0 1121	+5 2

DOUBLE PRECIPITATION

The mixture is brought to a volume of about 50 cc and a hydrochloric acid concentration of about 3*N* The solution is then titrated with 0 025 molar potassium ferrocyanide until a distinct excess (about 15 to 20%) is present as indicated by the ferric chloride test The precipitate is filtered after 15 minutes' standing on a Gooch crucible with paper mat and washed once with a small volume of 0 1*N* hydrochloric acid It is then transferred back into the original precipitation flask and treated with 40 to 50 cc water and about 1*N* ammonia until the precipitate is dissolved A slight excess of ammonia is not harmful but gives rise to the formation of the free alkaloid Five cc of concentrated or 10 cc of 6*N* hydrochloric acid are added The precipitate formed is allowed to stand for 15 minutes, collected in a sintered glass crucible (1 G –4) and further treated as described under the gravimetric determination of strychnine

TABLE VII —DOUBLE PRECIPITATION OF STRYCHNINE IN THE PRESENCE OF BRUCINE

(0 1066 Gm of strychnine and 0 2 Gm of brucine in all experiments)

Excess 0 025 Molar $K_4Fe(CN)_6$ in First Ppt %	Second Precipitation Volume	HCl N	Weight Ppt Gm	Strychnine Found Gm	Error %
12	50	0 2	0 1711	0 1007	−5 5
12	50	1	0 1780	0 1047	−1 8
20	50	1	0 1832	0 1078	+1 1
20	50	1	0 1785	0 1050	−1 5
20	50	1	0 1806	0 1062	−0 4
20	125	1	0 1823	0 1072	+0 6
20	125	1	0 1806	0 1062	−0 4
20	125	1	0 1767	0 1040	−2 4
20	125	1	0 1764	0 1038	−2 6

The results in Table VII show that 100 mg of strychnine can be determined in the presence of double the amount of brucine with an accuracy of about 1%

It is suggested that the methods described may be advantageously applied to the direct determination of strychnine and brucine in strychnos preparations First the sum of the two alkaloids could be determined by precipitation in acid medium with an excess of potassium ferrocyanide The weighed precipitate then might be decomposed with ammonia and the strychnine determined as described above

SUMMARY

1 The sensitivity of the precipitation of strychnine and brucine in hydrochloric acid medium with hydroferrocyanide has been determined

2 Strychnine can be determined with great accuracy by precipitation as hydroferrocyanide The precipitate is weighed in the air-dry form The method yields quantitative results even at great dilutions The determination of brucine is less accurate owing to the greater solubility of its hydroferrocyanide

3 A simple method is described for the quantitative determination of strychnine in the presence of brucine It is based on the fact that the hydroferrocyanide of strychnine is less soluble and is formed more rapidly than that of brucine

SCHOOL OF CHEMISTRY OF THE UNIVERSITY OF MINNESOTA,
MINNEAPOLIS, MINNESOTA

THE ARSENIC CONTENT OF CHONDRUS *

BY CHARLES H LAWALL AND JOS W E HARRISSON

In 1931 and 1932 we conducted an investigation of the sulphur dioxide content of Chondrus, which was reported in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, Vol XXI, No 11, November 1932, page 1146

In this paper we showed that sulphur dioxide is not a normal constituent of natural chondrus as had been claimed, and that chondrus of European origin as sold in America was invariably contaminated with sulphur dioxide as a result of the "sulphur bleaching" process to which it is exposed before shipment to America, and that the natural chondrus shows no evidences of sulphur dioxide when subjected to tests for that adulterant by the methods of the A O A C

In view of the fact that the European samples might possibly have been bleached with arsenic containing sulphur, it seemed advisable to make a further investigation of the samples to ascertain the arsenic content

As we had sufficient amount of all but one of the samples in question, we undertook the investigation and report the results herewith

The method followed was that of the A O A C Methods of Analysis, page 306, 3rd Edition

The preliminary procedure was as follows

Ten Gm of chondrus were digested with 25 cc of sulphuric acid and a total of 30 cc of nitric acid After the organic matter had been destroyed and the digestion was complete the remaining liquid was diluted to 100 cc and 10 cc of this liquid was used for each determination

The laboratory numbers, sources of the samples and sulphur dioxide content are repeated from the previous article

* Scientific Section, A PH A , Madison meeting 1933

The following results were obtained, the figures being the average of closely agreeing duplicates

Lab No	Source	SO_2 p p m	As_2O_3 p p m
33469	Wholesale Drug House	1260	6
33641	Wholesale Drug House	920	7
33642	Wholesale Drug House	4040	11
33705	Importing House ' Technical'	4080	3
33706	Importing House 'Medicinal"	2520	3 5
33902	Natural—before drying	none	12
33903	Natural—after first drying	none	10
33904	Natural—ready for shipment	none	8
33772	Natural—after 4 hrs drying	none	9
33773	Natural—after 2 days sun bleaching	none	10
33774	Natural—after 6 days sun bleaching	none	2
33775	Natural—in finished condition	none	5

Two other specimens were added to the list for investigation One was a sample of genuine natural chondrus imported from Ireland, and the other was an Irish Moss Pudding made from this same material

There was not sufficient of either of these samples to make sulphur dioxide determinations but the arsenic trioxide content of the chondrus itself was found to be 4 p p m and of the pudding 0 11 p p m

Upon studying these results it will be seen, *first*, that the arsenic content does not parallel the sulphur dioxide content, *second*, that the arsenic content of natural chondrus averages slightly higher than that of sulphur-bleached chondrus, the average for the natural being 7 5, while that of the sulphur-bleached is 6 1, *third*, that the arsenic content of every sample, whether natural or bleached is in excess of the tolerance of 1 4 p p m established for arsenic in food products, and *fourth*, that the content of arsenic is not uniform, even in samples from the same locality

In view of the wide variations in the arsenic content in samples from the same locality and in the same "collection" after the usual methods of handling, it was thought that possibly the arsenic content was due to adhering impurities and foreign matter In further investigation of this fact one of the samples of which a considerable quantity was still available, was carefully garbled, removing all portions of shell as well as sand and adhering foreign matter The garbled material was finely ground and subjected to examination for the arsenic content in comparison with the arsenic content of the impurities removed by garbling

The following results were obtained

	As_2O_3 p p m
Arsenic content of original sample	12 5
Arsenic content of garbled chondrus	12 5
Arsenic content of foreign matter removed by garbling	2 0

Our conclusions are that genuine unbleached or sun-bleached chondrus contains arsenic naturally, and that the arsenic content is well in excess of the tolerance for arsenic in food products

LABORATORIES OF LAWALL AND HARRISSON,
PHILADELPHIA, PA

COPTIS OCCIDENTALIS SALISBURY (FAM RANUNCULACEÆ) WESTERN COPTIS WESTERN GOLDTHREAD [1]

BY CHARLES E MOLLETT[2] AND B V CHRISTENSEN [3]

INTRODUCTION

Since large quantities of *Coptis occidentalis* are found growing in the mountains of northwestern Montana and northeastern Idaho, this investigation was made to determine the comparative medicinal value of this with that of the official *Coptis trifolia* found chiefly in eastern United States

REVIEW OF LITERATURE

The first description of the plant, which was later to bear the genus name *Coptis*, was by Halenius (probably a student of Linnæus), who placed it with the Hellebores and named it *Hellebore* or *Helleborus Trifolius* (4) It was so-called by subsequent botanists until it was separated from the Hellebore family by Salisbury, who described the plant in 1807 and created the genus *Coptis* and named it *Coptis trifolia* (4)

The species name, according to Latin nomenclature, should have been *trifoliata*, but according to present accepted procedures, the first name stands as the species name However, in some cases as in "Flora of the Rocky Mountains and Adja cent Plains ' (3) the species name *trifoliata* is still used

The genus name *Coptis* is taken from the Greek word *Kopo*, which means "to cut," from the cut or laciniated leaves of the hardy perennial plants of the Northern Hemisphere (1) According to the Index Kewensis, in the northern hemisphere this genus at present is composed of at least ten different species Foreign species given in "Index Kewensis" are *anemonæfolia*, *brachypetalæ*, *orientalis*, *quin quefolia*, *japonica* and *trifoliata* (19) C *quinquefolia* var *trifoliata*, *teeta* of the *Himalayas*, *chinensis* of China, *ospriocarpa* of India, and *marii* of Formosa

Of the North American species, Index Kewensis had, up to 1925, recognized only *trifolia*, *occidentalis*, *venosa* and *asplenifolia*

Following the description of trifolia in 1807, by Salisbury, a new species (*C occidentalis*) was described by Nuttall in 1838, which for some time represented the plants found growing in the northwest

Nuttall also split the genus *Coptis*, into Coptis and *Chrysocoptis*, on the basis of one flowered and ternately divided leaves for *C trifolia* and 2–4 flowered and pinnately divided leaves for *C occidentalis*, as representing the new genus *Chry socoptis* This latter genus has not been accepted by Index Kewensis as such, but is accepted as a synonym for *Coptis occidentalis*

---

[1] Investigation carried out in Laboratory of Pharmacognosy, College of Pharmacy, Uni versity of Florida

[2] Dean College of Pharmacy University of Montana

[3] Professor of Pharmacognosy and Pharmacology, University of Florida

AUTHOR S NOTE More work is being done upon the plants growing in Montana and gathered in various locations and at various altitudes as well as at different times of the year, the results to be published later in an additional paper

Nuttall further divided the species of the west into *C occidentalis* and *C lacinata*, on the basis of the size of the leaflets, their lobes and incisions as described by Charles V Piper in "Flora of Washington," 1906, page 276

The species *Coptis trifolia* is the only one which has ever been official in either the United States Pharmacopœia or the National Formulary, and is at present official in the National Formulary V under the name Coptis, Synonym, Goldthread, Botanical name, *Coptis trifolia*, Family, *Ranunculaceæ* (13) The entire plant is official (and consists usually of a nearly equal mixture of rhizomes and pressed leaves) (6)

The habit, range and habitat of *C trifolia* is given as follows A low perennial growing in moist woods and swamps of northeastern United States and Canada extending westward to Alaska (6) woods and swamps of northeastern North America south to Maryland mountains of North Carolina and Tennessee, and northeast Iowa (5) Northern United States and Canada in dark shady moist woods (8), in morasses of Canada and Siberia, Lapland and Kamchatka (4) damp mossy woods and bogs Newfoundland to Minnesota British Columbia and to the Alleghanies in North Carolina (7) woods and bogs of Greenland, Maryland Minnesota British Columbia Alaska and Eurasia (3)

BOTANICAL DESCRIPTION AND HABITAT

Descriptions and ranges of *Coptis* species, said to be growing in the Northwest, are as follows (12)

Herbs perennials low glabrous root stalks creeping Leaves ternately compound Flowers white, solitary or few on naked scapes Sepals 5–7 petal-like deciduous white or greenish Petals 5–6 small, linear cucullate Stamens 10–25 follicles 3–12 (Gk *Kopto* to cut, from the divided leaves)

A Leaflets obscurely 3 lobed, sepals oval or oblong obtuse petals enlarged at the summit West of the Cascade Mountains and east of the Cascade Mountains

AA Leaflets rather deeply lobed or segmented, sepals linear or ligulate attenuate, petals enlarged near the middle

B Leaves ternate

C All three leaflets long, petioluled leaf divisions obtuse, obtusely dentate seed oblong In the Cascades East of the Cascades (See Fig 1 *Coptis occidentalis*)

CC Middle leaflet long petioled lateral short petioluled leaf divisions acute, acutely dentate, seed oval West of the Cascades In the Cascades—*C lacinata*

BB Leaves pinnately 5 foliate West of Cascades—*C asplenifolia*

Fig 1—*Coptis occidentalis* Flowering plant Note three flowers Collected at Noxon, Montana May 1931

There is some doubt as to the range of *C trifolia* (3) (12), but no disagreement as to the range of *C occidentalis* growing only in northwestern United States

The plants, from which the rhizomes and rootlets were used in this investigation, were found growing in damp mossy and boggy woods of western Montana They are usually found in damp ravines and swampy woods, where the Arbor Vitæ (*Thuja plicata*) thrives Their range extends from the Bitter Root Mountains where the woods are not so moist, to the moist woods of the northwest ridges along the Continental Divide, which pass over the boundary into Canada *C occidentalis* is much smaller, with thin, paper-like leaves, in its southern range in the Bitter Root Mountains, than it is on the extreme northern border extending into Canada, where it is large and coarse The plants reach their largest size in the high, moist ravines, west of the Continental Divide, extending into Idaho

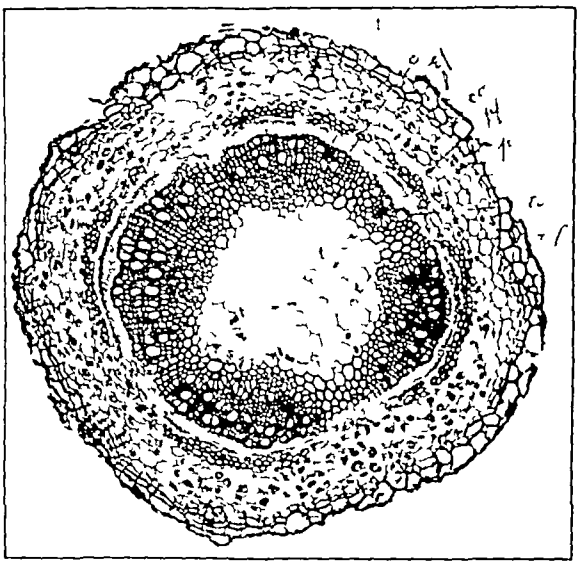

Fig 2—*Coptis occidentalis* Transverse section of rhizome × 60—*Ep*, epidermis, *h*, hypodermis, *co*, cortex, *pf*, pericyclic fibres, *p* phloem, *c*, cambium, *tr* tracheæ, *wf*, wood fibres in xylem, *m* pith

The official plant is collected while in flower, in May or June (5) Plants growing in Montana flower in April and May, putting up their pale, yellowish white flower while the ground is usually still frozen and covered with snow, this, and the pale, yellowish white color of the flowers, have given it the local name of "Snow Flowers" It is the first flower to appear in the springtime (near Noxon), in the mountains of western Montana, where the roots under investigation were obtained Climatic conditions in Montana make it impossible to gather the rhizomes and rootlets while in flower, as it blossoms while the ground is usually frozen and covered with snow It is not necessary to gather the entire plant of the western species as the rhizomes are twice as large as those of trifolia of the northeastern United States Using only the rhizomes and rootlets raises the medicinal quality of the drug, as the over-ground portion of the plant contains less of the alkaloids than the rhizomes and rootlets

This plant found growing in northwestern Montana, and northeastern Idaho corresponds with the description of *Coptis occidentalis* (Nuttall) (3), (13), and of *Chrysocoptis occidentalis* (Nuttall) (10)

EXPERIMENTAL PROCEDURE

Pharmacognosy—The rhizomes and rootlets were gathered in the fall, washed free from soil and leaf mold and dried The sample was reduced to a No 20 powder by first grinding the easily reduced portion to the required fineness in a Wyley mill and the remaining woody portion finished to the desired degree of fineness in a chaser mill and the whole mixed thoroughly

A portion of the powdered drug after being irrigated with alcohol, exhibited under the

microscope, characteristics similar to those found in *Coptis trifolia*, but the cells were larger and their walls were thicker and the starch grains larger and more numerous (5*b*) (6) (13) (16)

Scrapings from the rhizomes of *Coptis occidentalis* in water mounts under the microscope (5*a*), revealed starch grains, simple or occasionally 2–3 compound the single grains 16$^{\mu}$ in diameter and varying from spheroidal, ovoid, oblong, spindle shaped sub reniform concavo convex to irregular in form with a central to occasional excentric hilum, the latter frequently 2 to several cleft to crescent shaped the lamellæ being distinct in some of the larger grains

Most of the individual starch grains were up to 8$^{\mu}$ in diameter

The dried rhizomes were fixed by the usual method (5*a*), imbedded in celloidin and sections made

Transverse sections through the internode of the rhizome showed the following histological structures

1 A prominent large celled epidermis with thick suberized outer walls

2 A hypodermis of clear cells which undergo tangential division in the older rhizomes forming a cork cambium which begins to lay down subepidermal cork on its outer face

3 A region of from 5 to 7 layers of starch and alkaloid containing cortical parenchyma cells with thin walls The innermost layer of this region or endodermis did not differ in appearance from the other layers

4 A pericycle of several layers containing an interrupted circle of lignified pericyclic fibre groups which alternate with starch and alkaloid containing parenchyma

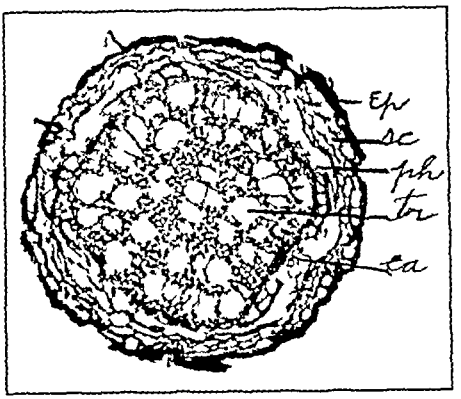

Fig 3—*Coptis occidentalis* Transverse section of rootlet × 68—*Ep*, epidermis, *sc*, secondary cortex, *ph*, phloem, *ca* cambium *tr*, tracheæ of xylem

5 A circle of up to about 15 to 17 open collateral fibrovascular bundles which are separated from each other by narrow medullary rays with lignified walls The phloem of these bundles is composed largely of sieve tubes and the xylem largely of tracheæ and wood fibres

6 A large central pith composed of thin walled parenchyma containing starch

Berberine was most abundant in the parenchyma cells (5)

Longitudinal radial sections showed the tracheæ to be mostly bordered pored with circular to elliptical bordered pits Some spiral tracheæ were evident in the protoxylem The bordered pored tracheæ measured were up to 32 microns in diameter Their end walls were oblique and porous

The wood fibres and pericyclic fibres possess lignified walls with porous slits and pointed ends, the lumen being broader than the walls

Both the cortical and pith parenchyma cells are elongated longitudinally The chief differences noted between the sections studied of the rhizomes of this species and *C trifolia* were

1 The more extensive and less spongy pith in *C occidentalis* than in *C trifolia*

2 The presence of a cork cambium and beginning deposition of cork tissue in *C occidentalis* and its absence in *C trifolia*

3 The absence of a distinct endodermis in this species and its presence in *C trifolia*

4 The presence of sclerenchyma fibres in the pericycle of *C occidentalis* and their absence of in the pericycle of *C trifolia*

5 The more extensive development of the xylem in *C occidentalis* than in *C trifolia*

6 A larger number of root systems emanate from the rhizome of *C occidentalis* than in *C trifolia*

A small sample of the drug was first extracted with ether and then with alcohol Each of these extracts contained alkaloids according to U S P X alkaloidal precipitation tests

The marcs from the above extracts were further extracted with dilute alcohol and this extract tested for alkaloids with negative results (The residue from the ether extraction was of a light yellow color, that from the alcohol was copious and of a dark red color)

These preliminary tests suggested a method of analysis as follows A sample of the powder was weighed out and placed in a Soxhlet extraction apparatus, macerated for several hours and extracted with anhydrous ether until exhausted the extract removed and evaporated spontaneously, cooled and dried to a constant weight in a desiccator (See Table I) The marc from the ether extraction was removed and dried and then exhausted with absolute alcohol The alcoholic percolate was evaporated to dryness at a low temperature on a water-bath, cooled and dried in a desiccator to constant weight (See Table I)

The residue from the ether extraction was of a pale greenish yellow color The residue was dissolved in hot alcohol, thrown into ten times its volume of distilled water, acidulated with dilute hydrochloric acid and the oily resinous precipitate collected on a filter The precipitate gave an oily stain and was resinous to the touch, completely soluble in warm sodium hydroxide solution and partly soluble in 80% alcohol, showing oil and resin The filtrate from the oily resinous precipitate was made slightly alkaline with ammonia water and the precipitate shaken out with ether and the ether evaporated spontaneously, which left colorless crystalline plates, which gave a purplish color when first heated with sulphuric acid (5) This indicated the precipitate was probably Coptine Further tests confirmed this and percentage yield was found to be as shown in Table I

The residue from the alcohol extraction was dissolved in a small amount of hot water and strongly acidulated with hydrochloric acid, filtered and set aside over night A copious deposit of bright yellow needle-shaped crystals formed These were filtered, the mother liquor concentrated and more hydrochloric acid added and the solution heated to the boiling point and again set aside over night The resultant crystals were added to those previously collected, the whole recrystallized from hot water and collected upon counter-balanced filters, interposed, dried in a desiccator and weighed The crystals were found to be insoluble in ether, soluble in water and alcohol, and were of a bright yellow color and needle shaped, corresponding to Berberine hydrochloride (11) For percentage yield see Table I

Samples of the powdered drug were placed in crucibles and incinerated according to the methods of the U S P X The ash was further treated by U S P X method to determine the acid-insoluble ash Results given in Table I

The larger portion of the insoluble ash was found to be silica (16) The soluble portion subjected to qualitative analyses gave tests for iron, aluminum, calcium, magnesium and potassium An aqueous extract of the powder also showed the presence of gallic and tannic acids, sugar, albumin and coloring matter

Coptis trifolia yields 3 75 to 5 25% total ash, of which about one-tenth is silica, with iron, aluminum, calcium, magnesium and potassium present (6) (See Table I)

Tests on the aqueous extract of *Coptis trifolia* showed the presence of tannic acid, gallic acid, starch, sugar, oil and resin, albumin and coloring matter

TABLE I—SHOWING COMPARATIVE ANALYSES OF *C occidentalis* AND *C trifolia*

	Coptis occidentalis	*Coptis trifolia*
Ether extractive	2 65 %	2 275%
Alcohol extractive	19 2 %	26 27 %
Total ash	4 39 %	4 35 %
Acid insoluble ash	0 490%	0 39 %
Coptine	0 31 %	0 3 %
Berberine	4 6 %	3 0 %

Therapeutics—The various species of *Coptis* are said to contain from 4% to 8% of Berberine (19), to which its principal action is said to be due It is said by recent authorities to be a simple bitter tonic, although it was formerly extensively used to heal aphthous sores in the mouth, as well as for various eye inflammations

A 100% glycerite, made by preparing the fluidextract in the usual way, evaporating off the alcohol and making up to the original volume with glycerin, has given good results, when applied to aphthous and other scores in the mouth

Since *C occidentalis* contains the same constituents and about the same percentage of such constituents as *C trifolia*, it appears logical that the medicinal effects of *C occidentalis* should be equal and similar to those of *C trifolia* For this reason and because of the abundance of *C occidentalis* in Montana and Idaho, it is suggested that *C occidentalis* be included with *C trifolia* in N F VI

CONCLUSIONS

1 Analysis indicates that *C occidentalis* contains the same active constituents in about the same amounts as *C trifolia*

2 For this reason and because of the abundance of *C occidentalis* in Montana and Idaho, it is suggested that *C occidentalis* be included with *C trifolia* in N F VI

3 *C occidentalis*, because of its abundance and convenient collection, is suggested as a commercial source of the alkaloids Coptine and Berberine in preference to *C trifolia*

THE ASSAY OF HYOSCYAMUS *

BY H G DEKAY[1] AND C B JORDAN

Hyoscyamus has been official in the past four revisions of the U S Pharmacopœia, and an assay process has been described in the last three The changes occurring in this assay have been primarily in that part of it dealing with the extraction of the alkaloids from the crude drug In the U S P VIII (first official process) the drug was macerated for 10 minutes with a mixture of 1 part of chloroform and 3 parts of ether, then ammonia water was added and the contents agitated during 1 hour The final extraction was made from a basic mixture by the use of chloroform

In the U S P IX, the process of extraction was changed as follows the drug was agitated during 2 hours with 300 cc of a mixture of 1 volume of chloroform and 3 volumes of ether to which ammonia water had been added An aliquot part of the immiscible solvent was then decanted and the assay completed as indicated in the first process The U S P X changed this to a percolation process, the same solvent being used

Various workers encountered many difficulties in the assay of this drug with the result that a number of processes have been presented for consideration during the past decade

Watkins and Palkin (1), workers in the Drug Control Laboratory, Bureau of Chemistry, U S Department of Agriculture, described a method for the assay of Hyoscyamus "which gave a yield of from two to three times as much alkaloid as that obtained by the U S P IX and X methods "

In order to check the various processes for the assay of Hyoscyamus, C B Jordan, Dean of School of Pharmacy, Purdue University, Chairman of Subcommittee No 6, U S P Revision Committee, submitted samples from the same lot of drug in No 60 powder to a number of experienced chemists for collaborative work He requested that three processes be used as follows Process No 1 (2), the U S P X process, process No 2, which was the same except that the drug was allowed to macerate over night, process No 3 (3), recommended by J J Durrett, who was, at that time, Chief, Drug Control, the U S Food and Drug Administration The last was a hot extraction process very much like that used by Watkins and Palkin (1) in their work with this drug This process required a special apparatus

---

* An abstract based upon a thesis by H G DeKay submitted to the Faculty of Purdue University in partial fulfilment of the requirements for the degree of Doctor of Philosophy

[1] Special worker for Sub-committee No 6 of the U S P Revision Committee

The following results were obtained (4) in terms of percentage of total alkaloids

Operator	Process No 1	Process No 2	Process No 3
1	0 072	0 098	0 168
2	0 0381	0 0442	0 092
3	0 0306	0 0345	0 0898
4	0 0535	0 0606	0 1108
5	0 0858	0 080	0 152
6	0 0381	0 0462	0 0722
7	0 072	0 063	0 131
8	0 088	0 109	0 137
9	0 090	0 1014	0 1014

The collaborators pointed out that in processes No 1 and No 2 difficulty was encountered during the acid extraction because of coloring matter which could not be removed by filtering They suggested that in process No 3 the small amount of alcohol used could explain the increase in yield of the alkaloid They also stated that it was extremely awkward to use the special apparatus for maceration and extraction and that the extractive was highly colored, making the end-point reading difficult

These reports indicated that it was difficult to obtain concordant results by either the first or the second processes and that the agreement in the third was far from satisfactory It is possible that the personal factor plays an important part, if so, an assay process should be devised that would reduce this factor to a minimum

The chairman of the Revision Committee received a definite recommendation from J J Durrett (3) regarding this assay process and the purity rubric of this drug It was passed on to the chairman of the Sub-committee on Crude Drug Assay The above-quoted results indicated to him that the whole question should be carefully studied, and this explains the assignment of the problem to H G DeKay, who had been working on the assay of Hyoscyamus for about twelve months

We believed that the higher results obtained by Watkins and Palkin, which we assumed was the basis for J J Durrett's recommendation, could be due to one or more of the following reasons *1* Failure of the U S P X process to extract all of the alkaloid, presumably the idea of Watkins and Palkin, *2*, the presence in the drug of bases other than alkaloids, *3*, the decomposition of the alkaloids during the assay process, or *4*, the formation of some alkaloidal hydrochloride in the evaporation with chloroform which would indicate a low yield of alkaloid Therefore, any successful study of this problem should cover these four points

The following determinations upon the pure alkaloids had been completed previous to H G DeKay's special assignment to the problem

I TO DETERMINE THE STABILITY OF ATROPINE AND HYOSCYAMINE

Experiments under A and B were performed by H G DeKay, A C Smith and C N Sprankle, graduate students at Purdue University

A TO DETERMINE THE EFFECT OF HEAT ON THE ALKALOIDS

Experiment 1 Four samples of pure alkaloid were dried at 80° C for 1 hour without loss

Experiment 2 The pure alkaloids were dissolved in 2% sulphuric acid, the solution was made basic with ammonia T S and extracted with chloroform The chloroform was evaporated to about 2 cc on a water bath and treated as follows, before completing the assay

	Atropine			Hyoscyamine		
	Assays	Used Gm	Recovered Gm	Assays	Used Gm	Recovered Gm
A Standard acid was added and the assay completed	8	0 0398	0 0472	2	0 0349	0 0354
B Dried in a current of air at 40° C	3	0 0486	0 0472	3	0 0328	0 0328
C Repeat B and dry the residue 48 hours in a desiccator	2	0 1070	0 1027	2	0 0455	0 0443
D Evaporate to dryness and heat 5 minutes	5	0 0361	0 0371	5	0 0351	0 0340
E Repeat D except heat 30 minutes	5	0 0349	0 0349	3	0 0351	0 0300

Conclusion From the above experiments it is evident that the heating of chloroform solutions of the pure alkaloids at water-bath temperatures does not cause any decomposition

B TO DETERMINE THE EFFECT OF CHLOROFORM UPON THE ALKALOIDS

Experiment 1 The pure alkaloids were dissolved in chloroform and the solution evaporated to 2 cc and treated as follows, before completing the assay

	Atropine			Hyoscyamine		
	Assays	Used Gm	Recovered Gm	Assays	Used Gm	Recovered Gm
A Evaporated to dryness on a water-bath and heated (1) 1 hour	2	0 1609	0 1591	2	0 1040	0 1032
(2) *over night*	2	*0 1609*	*0 1591*	2	*0 1040*	*0 1032*
B The assay completed	5	0 0422	0 0435	5	0 0301	0 0297
C Evaporated to dryness on a water-bath, (1) heated 15 minutes				2	0 0385	0 0411
(2) heated 30 minutes				2	0 0408	0 0411
(3) heated 1 hour				2	0 0413	0 0410
D Evaporated to dryness in a current of air dried in a desiccator for 48 hours	3	0 0239	0 0242			

Experiment 2 The alkaloids were dissolved in chloroform and allowed to remain in the solvent (A) 12 hours and (B) 24 hours, respectively, before completing the assay

		Gm	Gm		Gm	Gm
(A)	3	0 0419	0 0421	3	0 0301	0 0304
(B)	3	0 0431	0 0431	3	0 0200	0 0202

Conclusion The above experiments indicate that no hydrochlorides of the alkaloids are formed when their chloroform solutions are evaporated to dryness at water-bath temperatures

C TO DETERMINE THE EFFECT OF ASSAY PROCESSES ON THE ALKALOIDS

Experiment 1 (A) The U S P X assay process for Hyoscyamus was followed, atropine instead of the crude drug being used (B) Experiment A was repeated except that the final chloroform extract was dried in a current of air at 40° C and the assay completed

(A) Results of 2 samples Used 0 0480 Gm Recovered 0 0502 Gm
(B) Results of 2 samples Used 0 0463 Gm Recovered 0 0451 Gm

Experiment 2 Pure atropine was extracted with ammonia water, alcohol and ether in a Soxhlet apparatus for 2 hours, (A) the assay was completed (B) The final chloroform extract was evaporated to dryness placed in a desiccator over night and the assay completed

(A) Results of 2 samples Used 0 0481 Gm Recovered 0 0488 Gm
(B) Results of 2 samples Used 0 0422 Gm Recovered 0 0423 Gm

Experiment 3 (A) An exhausted drug was fortified with equal parts of pure atropine and hyoscyamine, placed in a Soxhlet apparatus and assayed according to the process recommended by J J Durrett (B) The above experiment was repeated, the final chloroform solution was evaporated to dryness on a water bath taken up in chloroform and again dried This was repeated two more times before completing the assay

(A) Results of 2 samples Used 0 021 Gm Recovered 0 0236 Gm
(B) Results of 2 samples Used 0 021 Gm Recovered 0 0215 Gm

Experiment 4 A definite weight of a mixture of equal parts of pure alkaloids was added to the crude drug and then assayed by the above method

Results from 3 samples Added alkaloid 0 0207 Gm Recovered 0 0194 Gm

Experiment 5 Experiment 4 was repeated to the point where the final chloroform solution is evaporated to low volume This extract was evaporated to dryness on a water-bath redissolved in chloroform and again dried this was repeated two more times and the assay was completed

Results from 2 samples Added alkaloid 0 020 Gm Recovered 0 0173 Gm

Conclusion A careful study of the above experiments indicates

1 That the alkaloids of Hyoscyamus undergo no change during the regular assay process, *2*, that the alkaloids may be heated at water-bath temperatures without danger of decomposition, *3*, that no hydrochlorides of the alkaloids are formed when chloroform solutions of them are evaporated to dryness, and *4*, that the assay process recommended by J J Durrett extracts some volatile base

Schou and Bjerregaard (5), while working upon sterilization of solutions, found that solutions of atropine could be heated at 120° C over a period of 20 minutes without danger of decomposition

Five experiments were completed to determine whether ammonia contaminates the residues from the assay processes It is apparent that any ammonia which is carried over by the chloroform in the final extraction is eliminated in the evaporation process

Our results corroborate the work of Watkins and Palkin on the stability of these alkaloids and verifies their conclusion that the residues after shaking out and drying are not contaminated with ammonia

II EXPERIMENTS ON POWDERED HYOSCYAMUS

A 75-pound lot of Hyoscyamus in No 60 powder was obtained from Eli Lilly & Company for this work The drug was ground and mixed by the Company Ash determinations were made with the following results

Total Ash	Acid Insoluble Ash
23 25%	8 71%
23 29%	8 55%
23 20%	8 67%
23 17%	8 87%

Qualitative inorganic analysis upon the ash showed the presence of potassium, sodium, ammonia and iron as the sulphates, nitrates and chlorides There were traces of aluminum

Assay Experiments —Experiment 1 A sample of drug was subjected to the U S P X process of extraction, stronger ammonia water being used The extract was subjected to the purification process recommended by Watkins and Palkin as follows The extract was evaporated to low volume, 10 cc of 0 05*N* sulphuric acid and 5 cc of water added and the evaporation continued until the odor of ether had disappeared The acidified liquid was decanted into a 50-cc volumetric flask The residue remaining in the flask was dissolved with chloroform, 5 to 10 cc of acidulated water added and the chloroform removed by heating The contents of the original flask were poured into the volumetric flask, which was cooled and made up to volume The mixture was filtered, the first few cc 's rejected, an aliquot part collected, made basic with ammonia water, shaken out with chloroform and the assay completed with the following results

1	0 079%
2	0 073%

The titrated mixtures gave positive results for primary amines by the isonitrile reaction

Experiment 2 Samples were subjected to the U S P X assay process modified by macerating over night and by the use of stronger ammonia water with results as follows

1	0 0663%	7	0 073 %
2	0 079 %	8	0 0763%
3	0 057 %	9	0 066 %
4	0 082 %	10	0 0731%
5	0 0834%	11	0 0761%
6	0 0733%	12	0 0633%
		Average	0 073 %

The titrated mixtures gave positive results by the isonitrile test

Experiment 3 Samples of the drug were subjected to the U S P X assay process with the Watkins and Palkin purification process being used in place of shaking out with dilute sulphuric acid

1	0 110%	7	0 087 %	13	0 122%
2	0 093%	8	0 107 %	14	0 114%

		Average	0 0812%

Positive isonitrile tests were obtained

Aliquot portions of the last five samples obtained after the purification process were evaporated to dryness on a water bath and dried 1 hour The residues were taken up in chloroform, standard acid added, and the chloroform then removed by evaporation before the assay was completed

4	0 0413%	7	0 039 %
5	0 044 %	8	0 036 %
6	0 039 %	Average	0 0398%

These titrated residues gave no isonitrile test

(*To be continued*)

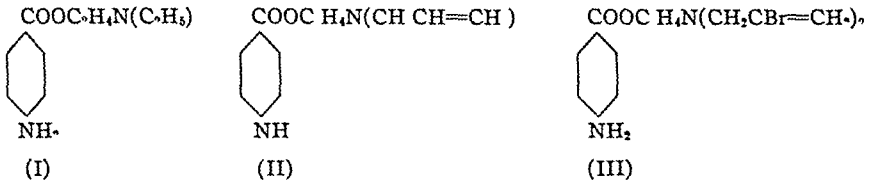
DI-β-BROMALLYLAMINO ETHYL *p*-AMINO BENZOATE *

BY W BRAKER AND W G CHRISTIANSEN

During the course of an investigation of a variety of local anesthetics, we have prepared di-β-bromallylamino ethyl *p*-amino benzoate This substance is analogous to procaine, the diethylamino group in the latter has been replaced

* Scientific Section A PH A Madison meeting, 1933

with a dibromallyl amino group The corresponding diallylamino compound is known (1) The structural relationship between procaine (I), di-β-allylamino ethyl *p*-amino benzoate (II) and di-β-bromallylamino ethyl *p*-amino benzoate (III) is indicated below



The compound (III) was obtained by condensing di-β-bromallylamino ethanol with *p*-amino benzoyl chloride The substance was isolated as its dihydrochloride A stable 2% aqueous solution of di-β-bromallylamino ethyl *p*-amino benzoate dihydrochloride could be made, but an electrometric titration indicated the p_H of this solution to be 1 9 An effort to buffer with disodium hydrogen phosphate was unsuccessful because of the fact that the addition of a minute quantity of the buffer resulted in the precipitation of the compound

A borate of the base (III) was also prepared but the compound was hydrolyzed in aqueous solution thereby precluding biological testing

EXPERIMENTAL

Preparation of di-β-Bromallylamino Ethanol—Fifty Gm of 2,3-dibrom propene and 8 Gm of mono-ethanol amine were dissolved in 100 cc of 95% alcohol, 80 Gm of silver oxide were added in small quantities with stirring, the mixture was stirred for two hours after the addition of all the silver oxide The mixture was then filtered and the filtrate fractionated Twenty-five Gm of a light yellow oil were obtained boiling at 141–145° C at 9–10 mm Yield—66%

Assay	Nitrogen	Bromine.
Found	4 58%	53 24%
Calc for $C_8H_{13}Br_2NO$	4 68%	53 51%

Preparation of p-Amino Benzoyl Chloride—This was obtained by the method of McMaster (2)

Preparation of di-β-Bromallylamino Ethyl p-Amino Benzoate—2 65 Gm of *p*-amino benzoyl chloride were dissolved in 20 cc of dry benzene To this solution, one consisting of 5 1 Gm of di-β-bromallylamino ethanol in 60 cc of benzene was added The solution was refluxed for 3 hours A yellow solid which separated during refluxing was filtered off, washed with ether and dried *in vacuo* An assay indicated that it was not the compound intended and it was not further investigated

The benzene filtrate from the reaction was treated with dry hydrochloric acid gas A light yellow, very viscous oil separated The benzene layer was decanted and the oil was dried *in vacuo* over calcium chloride and sodium hydroxide

The substance was identified by assay to be the dihydrochloride of di-β-bromallylamino ethyl *p* amino benzoate

Assay	Nitrogen	Chlorine
Found	5 61%	15 05%
Calc for $C_{16}H_{20}O_2N_2Cl_2Br_2$	5 70%	14 46%

SUMMARY

(1) Di-β-bromallylamino ethyl *p*-amino benzoate was prepared

(2) Aqueous solutions of the dihydrochloride are too acid for anesthetic tests The solutions are incapable of buffering without precipitating the base from solution

PHYSICS IN PHARMACY

BY JOHN URI LLOYD, WOLFGANG OSTWALD AND HANS ERBRING

(*Continued from page 221, March issue*)

In *Fig 13*, for example, quantities of absorbed, saturated solutions of KCl, $BaCl_2$ and $FeCl_3$, under identical experimental conditions, are recorded With increase in valence, there is increase of absorption Furthermore, $FeCl_3$ in dilute solution is strongly hydrolyzed The retained liquid volume must vary, not only with the concentration of the solutions, but also with the electrocapillary effects of the different ions,[1] and finally, with the influence of the dissolved substance on the state of swelling of the cellulose fibres

10 Influence of Concentration and Temperature

TABLE IX —INFLUENCE OF CONCENTRATION

System $FeCl_3$, concentrations *as below*, *vs* Water $d = 1\,5$ mm Paper dry at start.

Duration Hours	$FeCl_3$—Increase Mm	H_2O—Decrease Mm	Total Difference Mm

80	3 0	5 0	8 0
4 wks	1 0	3 0	4 0
25% Urea Solution			
10	0 5	0 5	1 0
20	1 0	2 0	3 0
40	1 5	2 5	4 0
80	1 5	3 5	5 0
12 5% Urea Solution			
10	0 2	0 5	0 7
20	0 5	1 5	2 0
40	0 5	2 5	3 0
80	0 5	3 5	4 0

The influence of *Concentration* is shown in *Tables IX and X*, and in *Figs 14* and *15* for Ferric Chloride and Urea In the figures, the individual curves denote for the several concentrations, increases of level in cylinder S after each period of time, *e g*, 10, 20, 40 and 70 hours These curves are, as it were, cross sections taken at each period of time, through the speed curves of the increase of level

Only the sections through the ascending branch of the curves up to the maximum are here of interest

With $FeCl_3$ (see *Fig 14*), a group of curves is obtained, the lowermost of which, corresponding to the shortest period of time, differs very little from a straight line, while the curves obtained by sections at later periods of time have a faintly S-shaped course It should be remembered in this connection, that $FeCl_3$, on account of its hydrolysis in solutions, represents a relatively complicated system

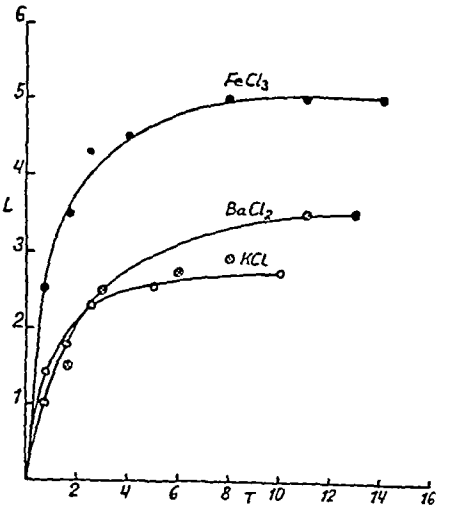

FIG 13.—L, Quantity of liquid held back by paper, in mm, T, Time in days

Urea, on the contrary, shows much simpler curves, the two lowermost of which

differ but little from a straight line All deviations, however, are in the sense of curvature *convex* to the axis of concentration Still, this mode of deviation and curvature is characteristic for most of the concentration functions of the directly measured osmotic pressure of concentrated solutions, whether molecular-disperse or colloidal [1]

Influence of Temperature —To study the influence of temperature, experiments were carried out under identical conditions, except that the temperature in one case was 20° C (room temperature), in the other 50° C (Air-thermostat)

TABLE XI

System $FeCl_3$ (saturated), *vs* Water $d = 7$ cm Paper dry at start

Duration	Increase of Level at 20°	Increase of Level at 50°
4 hrs	0 8 mm	0 9 mm
30 hrs	1 4 mm	1 6 mm
50 hrs	2 1 mm	2 5 mm

Table XI shows a slightly higher increase of level at 50° than at 20°

11 Isothermal Distillation —We mentioned before, that part of the liquid evaporates and condenses along the walls of the tubes This suggested the possibility that water, having a higher vapor pressure, may be transferred into cylinder S through isothermal distillation No doubt such a process takes place, but we can show that isothermal distillation, alone, is not sufficient to produce the Effect here described

In order to test out this possibility, experiments were conducted with identical arrangement of apparatus, except that *filter paper was not used* If in the course of time differences of level develop under these conditions, they can be explained only through differences of vapor pressure Our experiments (see *Table XII*) have shown that after about 3 days, a small difference of level in the expected direction, indeed, appears This difference, however, is incomparably smaller than the experiments with filter paper have shown, in which, in a shorter time, a value 20 times as much has often been obtained

TABLE XII

System $FeCl_3$ (saturated), *vs* Water

Duration	$FeCl_3$ Increase	H_2O Decrease	Total Difference	Length of d
2 hrs				4 cm
20 hrs				
72 hrs	0 3 mm	1 0 mm	1 3 mm	
5 days	0 5 mm	1 5 mm	2 0 mm	
20 hrs	0 2 mm	0 2 mm	0 4 mm	1 5
48 hrs	0 7 mm	0 7 mm	1 4 mm	
60 hrs	0 7 mm	0 7 mm	1 4 mm	
5 days	1 0 mm	1 0 mm	2 0 mm	

These results show that the differences in vapor pressure produce our Effect on a very small scale, hence the velocity of isothermal distillation is far too small to account for the relative magnitude of our Effect

[1] Cf Wo Ostwald, *Kolloid Z*, 49 (1929), 62 80, 56 (1931) 263, *Z physiol Chem A*, 159 (1932) 375

Surface Tension —Motions in capillary systems have been linked with differences in surface tension since Dutrochet, and more recently, since I Traube and others The capillary rise in filter paper is of course a result of surface tension, and will vary in height or speed, according to the magnitude of the tensions of the two liquids As soon as the 2 liquids have met in the filter paper, however, there can no longer be any difference of surface tension between them There may remain differences in *wetting power*, which would lead to the displacement of the pure solvent by the better wetting solution Thus a movement of liquids might arise which, however, would stop at once when the capillaries of the filter paper are saturated with the better wetting, dissolved substance

In order to examine the extreme case of such a wetting current, a very dilute (0 05%) soap solution was placed against pure water In this case, the difference of the two surface tensions is extremely great, at any rate considerably greater than, *e g*, in the case of $FeCl_3$ *vs* water Also, the wetting power of soap solution is naturally greater than that of pure water The effect produced is shown in *Table XIII*

TABLE XIII

System Sodium Palmitate (0 05%) *vs* Water

Duration	Soap Solution Decrease	Water Increase
24 hrs	1 0 mm	
46 hrs	1 0 mm	
70 hrs	1 5 mm	1 0 mm
8 days	1 5 mm	1 0 mm
10 days	1 5 mm	1 2 mm
15 days	1 5 mm	1 2 mm

A transfer of soap solution to water is distinctly noted, but again the Effect is of considerably smaller magnitude than in the case of $FeCl_3$ *vs* H_2O, notwithstanding the fact that the difference in surface tensions and wetting powers is much greater in the former than in the latter Besides, the movement ceases after about 3 days, which agrees with theoretical prediction

Thus the source of energy causing the Effect described, cannot reside in differences of surface tension and of wetting power

III THEORY OF THE EFFECT

Before giving the theoretical explanation of the Effect, we will summarize once more the principal phenomena graphically, as it is done in *Fig 16* The Effect, as to time, takes place in three parts (I, II, III) To these, strictly speaking, should be added a "prelude," consisting in the preliminary capillary rise of both liquids

In *Fig 16*, *A* shows the rise in the salt tube, or the difference of level of both liquids during the experiment *D* shows the location, resp , the migration of the diffusion zone between salt solution and water during the process This migration within the filter paper is represented somewhat more plainly in *C* Finally, *D* shows the change of the average difference of densities of the liquids to the right and the left of the filter paper during the process This difference of density is only estimated from the intensity of coloration, *e g*, in the experiments with $FeCl_3$, hence the curve cannot be considered of quantitative value, although it correctly represents differences of actual observation

With the aid of this synoptical *Fig 16*, we present the following

THEORY OF THE EFFECT

Preliminary Process Water as well as salt solution, rises in the siphon as a result of surface tension [1] The liquids meet in the filter paper

In our experiments, the salt solution was given an advantage in order to enable the two liquids to meet at about the middle of the strip (cf *Fig 16, C–I*) This is

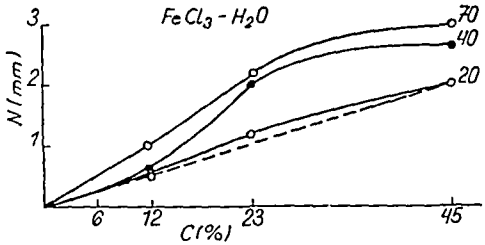

Fig 14 —C, Concentration in %, N, Increase of level in mm , Concentration curves after 20, 40 and 70 hrs

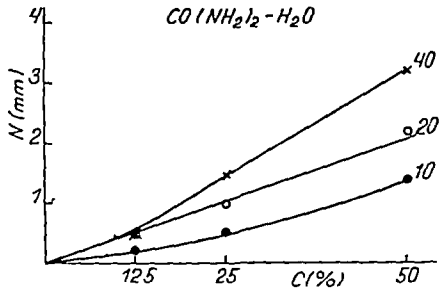

Fig 15 —C, Concentration in %, N, Increase of level in mm , Concentration curves after 10 20 and 40 hrs

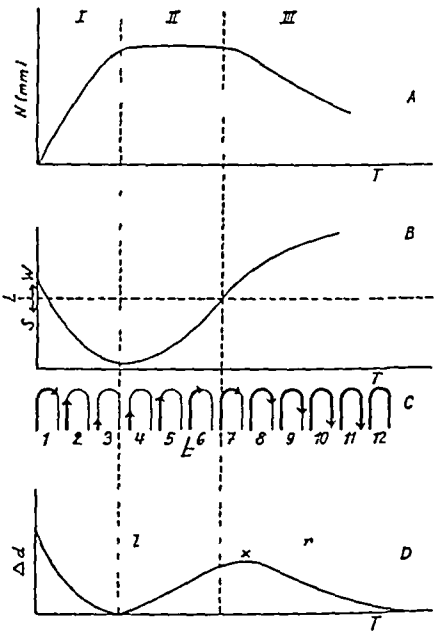

Fig 16 —Scheme A N, Rise in the salt tube, or difference of level of both liquids, T, Time Scheme B L, Position of zone limit of diffusion, W, Water tube, S, Salt tube, T, Time Scheme C L, Position of zone limits of diffusion Scheme D Δd, Average difference of densities of liquids to left and right in filter paper, l, Left tube heavier, r, Right tube heavier, T, Time

the starting condition, at which, in our experience, the Effect manifests itself most strongly

I The *First Divisional Effect* consists in a steep rise of liquid in the salt tube, *i e*, a sharp increase in the difference of level, with which is connected a sinking of the interface salt-solution-water in the salt tube (easily recognized with colored salts), and finally a corresponding decrease of the differences of weights of the liquid cylinders in both siphon tubes (cf *Fig 16, I–D*)

[1] The remarkable phenomena of capillary rise of solutions in filter paper have been pointed out by the senior author, more than 50 years ago PROC A PH A , 1879–1885 reprinted in *Kolloidchem Beihefte*, 8 (1916), 174

At least three sources of energy may be named as bringing about this movement of liquids First, the process is evidently that of a hydrostatic siphon effect When we connect two liquids of different densities by means of a siphon, as depicted in *Fig 17*, hydrostatic equilibrium will exist only when the products of height times density are equal in both arms of the siphon In the arrangement shown in *Fig 17a* (adopted in our experiment), the weights of the liquid columns in both branches are evidently not equal at the start Therefore, liquid will move in the direction of the arrow, from water to salt solution, which continues until the two liquid columns, now of different lengths, have again attained equal weights (cf *Fig 17b*) In contrast with an ordinary siphon with large cross section (*e g*, a glass tube), the hydrostatic equilibrium in our experiment does not take place instantaneously, but requires, for example, up to about 10 days' time This is not

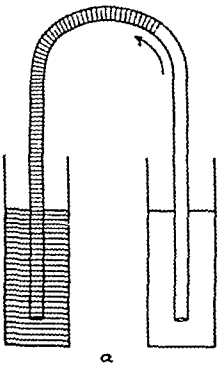

Fig 17*a*

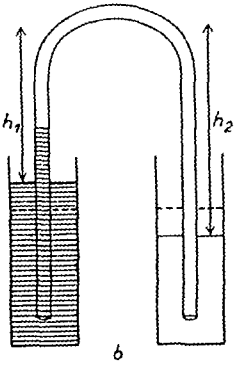

Fig 17*b*

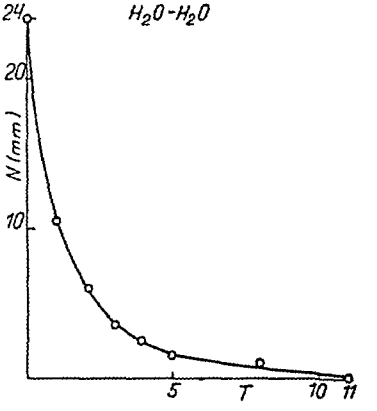

Fig 18—N, Difference of level in mm, T, Time in days

surprising when we consider the fact that, according to Hagen-Poiseuille's law, the velocity of flow decreases exceedingly fast with the diameter of the capillary tubes, for circular pipes in the ratio of r^4, *i e*, the fourth power of the radius Besides, we have in filter paper very irregular capillary spaces, which compel the current to follow detours

The slowness of a purely hydrostatic equalization in filter paper is well illustrated by the experiment of *Fig 18* Hydrostatic equalization was observed in a system containing water on both sides, but in which a difference of level of 24 mm was given to it at the start About 11 days were required for the termination of this purely hydrostatic equalization

Thus, one explanation of the 1st divisional effect which readily suggests itself, would consider the rise as a simple hydrostatic *Capillary Siphon Effect*

However, this explanation does not exhaustively describe the dynamics of the process Another source of energy exists, for it is evident that within a period of 11 days of experimentation, with the system employed, *Diffusion* must also become effective In the capillary siphon we have a continuous passage between salt solution and water, which presents the preliminary conditions for diffusion to manifest itself The diffusion of the salt molecules takes place in opposite direction to that

of the water current, which from hydrostatic causes, flows from the water tube to the salt tube Although this current overcomes the motion of diffusion, as is evi denced by the retrogression of the joint diffusion surface, diffusion will nevertheless not be completely inactive It will rather act always in the direction of in creasing the weight in the salt tube, *i e*, constantly supporting the hydrostatic effect Hence, the mechanism of liquid movements during the first divisional effect, is a combination of a purely hydrostatic effect (represented by the initial condition), and a simultaneous secondary hydrostatic effect produced by diffusion Thus the strip of paper acts at first as a "capillary siphon," as well as a *Diffusion Siphon*

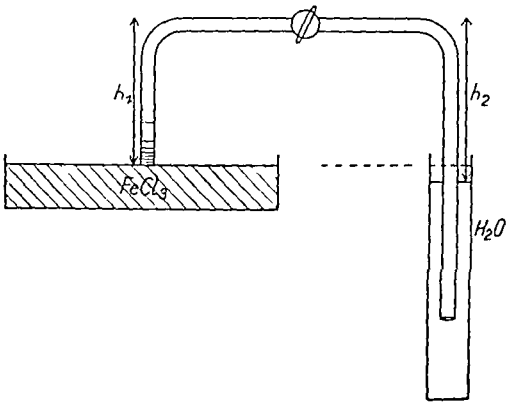

Fig 19

The mode of action of such a "Diffusion Siphon," can very well be demonstrated by the following arrangement of apparatus, to which E Manegold—Gottingen kindly called our attention [1] *Fig 19* A bent capillary tube dips at the left end directly beneath the surface of a salt solution contained in a wide dish, at the right into water contained in a narrow cylindrical glass vessel The siphon, fitted with a glass stop-cock in its center, is first filled with water On opening the stop-cock, diffusion of the salt begins, evidenced by the drawing up of water, as shown by the following figures, for which we are also under obligation to E Manegold

Time	3 days	5 d	7 d	9 d	10 d
Differences of level	2 1 mm	3 5 mm	4 9 mm	5 59 mm	6 7 mm

However, the effect of diffusion very probably is not only hydrostatic, this brings us to the consideration of a *third* source of energy for the first divisional effect

It is generally accepted that a dissolved substance, also a diffusing substance, develops an *osmotic pressure* This osmotic pressure becomes hydrostatically active and measurable, only when the solution meets a mechanical obstacle which hinders the mobility of the dissolved molecules, but not the mobility of the solvent It is merely another expression of the same fact when we substitute for the term "osmotic pressure," the osmotic attraction of the solvent by the dissolved particles Ordi narily, the scheme of a semipermeable membrane is selected in demonstrating this tendency of the solvent being attracted by the dissolved molecules, this effect is explained in molecular kinetics by a bombardment of the membrane by the dissolved molecules It seems, however, that the scheme of a semipermeable membrane is not the only possible method of converting the osmotic pressure into a hydrostatic one, demonstrating the osmotic attraction of liquids According to the customary

[1] We sincerely thank Dr Manegold for this friendly suggestion, as well as for others kindly made

notion, the dissolved molecules bounce perpendicularly upon the membrane When the membranes are thick and curved cylindrically, a *slanting*, or even *tangential* impingement of the molecules upon the cylindrical walls of the pores is possible, and has already been the subject of discussion Also, the well-known experiments of Bartell and Bigelow,[1] E Cohen[2] and others, have shown that osmotic effects may be observed, also, in clay cylinders, whose pore-diameters are notably greater than the diameter of the dissolved molecules (osmotic pressure with permeable membranes) [3]

In pursuing these reflections, we may conclude that in the case of diffusion in a capillary system of the nature of filter paper, the conditions are realized for the manifestation of osmotic effects, *i e*, an attraction of the solvent by the salt molecules, here also hindered in their mobility In such a system, the salt molecules will strike with exceedingly great frequency against the side walls, will thereby suffer a retardation of motion, and thus attract solvent in the same manner as they do in an ordinary osmotic cell Then we should be dealing here with "Osmosis without membrane," or "Capillary Osmosis" Even in the case when the origin of osmotic pressure is not referred to molecular kinetics, but if, *e g*, as H Hulshof[4] has done, a "tangential pressure" and an activity of the capillary layer are introduced, based on thermodynamic points of view, a capillary system of the character of filter paper may also be placed in parallel with the usual membrane

This third explanation of the "first divisional effect" would then be formulated as follows The impinging of the salt molecules upon the capillary walls of the strip of filter paper causes retardation of the free movement, and consequently of the diffusion of the salt molecules, but not of the movement of the water molecules, which are present in excess Therefore, an osmotic pressure arises in the direction toward the salt molecules, thus an attraction of the solvent This osmotic attraction of the solvent would act in the same sense as the two first-named sources of energy, at least as long as there is salt in the lower part of the salt tube If the salt diffuses further upward, the scene of its osmotic activity would also move upward We shall shortly discuss this effect more in detail

To sum up There are three sources of energy for the "first divisional effect" (1), A primary hydrostatic pressure, existing at the start of the system, (2), A secondary hydrostatic pressure, caused by diffusion and corresponding increase of weight in the salt tube, (3), Capillary-osmotic pressure, likewise caused by the diffusing salt molecules

AN EXAMINATION OF CEANOTHUS VELUTINUS *

BY L W RICHARDS AND E V LYNN

This member of the buckthorn family is an evergreen shrub found from British Columbia to California and from the Rocky Mountains to the Pacific Coast It is commonly known as sticky laurel or as mountain balm, but also by other names It grows best in sandy or rocky soil in the hills and is found profusely on logged-off land, of which the acreage on the coast is large and constantly increasing Wahlenberg (5) has recommended it as an aid in reforestation

The leaves are covered with a sticky substance of cinnamon-like odor, which the flowers also possess in a magnified degree Because of this waxy matter the plant is considered a serious fire-menace in the Californian forests

The plant has previously been examined three times, but not exhaustively In 1916, Scalione and Blakemore (2) made an investigation, particularly of the wax, 7 3 per cent, and of the tannin, 17 3 per cent In 1922, Howard (3) classified the leaf-wax as a balsam because it yielded a volatile oil and cinnamic acid A year later Lynn, Lee and Clausen (4) distilled an oil from the leaves and suggested that it is largely aldehyde

The eastern species, *Ceanothus americanus*, has been examined extensively and repeatedly since the middle of the last century An alkaloidal mixture, ceanothyn, is well known in certain medical circles, it is obtained from the roots and root-bark

The material used in this work was gathered mostly near Seattle, but also partly near Missoula, Montana It was freed from foreign matter, cleaned well and dried in the air Some of the roots and leaves were powdered before use

Histological —In order to throw some light on the origin of the sticky coating, which is found in great abundance on the leaves, permanent and temporary sections of the latter were made These revealed at frequent points pear-shaped structures descending from the upper epidermal cells, the point near the surface consisting of two parallel rows of large, pentagonal cells The two rows separated half way down and formed the circular end Within this cavity was found a network of smaller, thick-walled cells which undoubtedly is conductive tissue and forms a canal through the leaf Of course, the stomates are on the under side of the leaf, *not on the upper surface* While *the interior portion* of this peculiar structure was easily stained by various reagents, the large outer cells were unaffected by any of them Although the content would suggest a secretory layer, there is no reason to relate the structure to secretion Dr Eames, of Cornell, expressed the opinion that the cylinders are bundle-sheaths and probably not linked with the balsam, and in this Dr Rigg of Seattle concurs It is interesting to note, however, that the structure is not possessed by any of six other species of *Ceanothus*, which also do not have the balsamic coating These are *prostratus*, *americanus*, *ovatus*, *pubescens*, *fendleri* and *thyrsiflorus* The structure was found to be missing in the leaf-bud and in very immature leaves It evidently appears at the time when the tissues are first differentiated according to function

Proximate Analysis —This was made in the usual way on the leaves and on the root-bark

* Scientific Section, A PH A , Toronto meeting, 1932

	Leaves	Root Bark
Loss in air	50 6	48 3
Ash	4 5	6 5
Petroleum-ether extract	12 8	0 5
Ether extract	12 8	2 2
Crude fibre	12 3	17 6
Total nitrogen × 6 25	10 6	

Selective Extraction—The bark, wood and flowers were each submitted to selective extraction by the solvents given The results follow

	Bark	Wood	Flowers
Petroleum ether	1 18	0 75	2 84
Ether	1 89	0 27	2 48
Alcohol	12 40	4 51	13 85
Acetone	0 42	0 59	3 47
Carbon disulphide	0 04	0 14	None
Ethyl acetate	0 07	0 04	None
Water	8 36	3 72	16 70

Volatile Oil—The flowers furnished 0 1 per cent of an oil which was apparently unlike that from other parts of the plant The total amount of flowers available was not sufficient to warrant any examination of the oil

From the leaves by distillation with steam, there was obtained 0 14 to 0 21 per cent of oil, the amount being largest during the winter months and gradually decreasing up to the time of flowering in May and June Judging by the index of refraction, however, the oil obtained at different times of the year was constant in composition It was reddish brown in color and possessed a strong, aromatic and pungent odor The constants were specific gravity at 20° C 0 9565, index of refraction at 20° C 1 509 to 1 542, specific rotation −12 5°, saponification number 148 4, 142 0 and 155 0, 22 per cent soluble in sodium hydroxide, 20 per cent soluble in sodium bisulphite solution

The whole oil was fractionated and refractionated several times at 5-mm pressure with final results as given in the table

Fraction Degree	Per Cent	Approximately at 760 Mm Degree	n at 20° C
65– 80	7 5	165	
80– 90	8 0	190	1 5360
90– 94	14 0	211	1 5600
94– 98	7 5	214	1 5691
98–120	4 5	230	1 5031
120–125	4 0	239	1 4859
125–128	4 5	252	1 5015
128–135	3 0	259	1 5110
135–145	5 0	266	1 5150
145–157	9 5	273	1 5180
157–165	7 0	280	1 5200
Residue	25 5		

The chief constituents were found to be ethyl and cinnamyl cinnamates, the former in fractions 8–10 and the latter in these and the residue Saponification of the oil boiling at 132–135° gave cinnamic acid, melting at 132° C and

oxidizing with potassium permanganate to benzaldehyde The separated aqueous solution contained ethyl alcohol which was isolated and identified by conversion to the benzoate and acetate Cinnamyl cinnamate, melting point 43–44° C, was separated by treatment with warm alcohol and was further characterized by saponification to cinnamic acid and cinnamyl alcohol, whose phenyl urethane melted at 90° C

Salicylaldehyde, semicarbazone melting at 225° C, was apparently the chief component of fractions 2 and 3, which gave with ferric chloride a deep violet color

The fraction boiling at 126–128° probably contained esters of an alcohol with a strong odor like geraniol, although a diphenylurethane melting at 56° C and a phthalate melting at 204–205° C could not be referred to a known alcohol The acids from saponification were cinnamic acid and probably valeric acid, the latter partly identified by odor and boiling point

The lowest fraction contained terpenes which were not identified From Fraction 2 a bromide was separated with a melting point of 105° C (limonene?) and from Fraction 4 a bromide melting at 124° C (dipentene?) Fraction 10 also furnished a bromide melting at 92° C No further study was made of these The residue contained, with the cinnamyl cinnamate, a paraffin melting at 62° C

It is interesting to note that cinnamic aldehyde could not be identified in any of the fractions, notwithstanding that the odor is suggestive and that others have predicted its presence

Alkaloid —Preliminary experiments proved that the leaves do not yield alkaloids, but that some could be extracted from the bark and more from the root bark For further study a large quantity of the latter was collected, dried and ground to a coarse powder After considerable experimentation, it was found best to extract first with chloroform, from which the alkaloidal material was removed by means of very dilute sulphuric acid This solution gave with ammonia a copious, curdy, white precipitate which could again be collected by chloroform After repetition of the process several times, the precipitate was collected and dried, the yield being approximately 0 1 per cent

It was very soluble in chloroform and fairly so in hot alcohol or hot methyl alcohol, but was only slightly soluble in the cold alcohols, in ether, acetone, petroleum ether, benzene or carbon tetrachloride It was practically insoluble in water By means of hot methyl alcohol, there were obtained minute crystals in the form of raphides or needles, which were perfectly colorless This crystalline material decomposed when heated slowly and melted at indefinite points, when the temperature was raised quickly, the melting point was fairly constant at about 270° C with decomposition

Analysis by combustion gave figures which agreed closely with the simple formula, $C_{23}H_{26}N_2O_4$ Those for six consecutive determinations of carbon and hydrogen and three for nitrogen were as follows

	1	2	3	4	5	6
Carbon	69 7	70 0	69 9	69 8	70 2	70 0
Hydrogen	7 0	7 0	7 1	6 8	7 0	7 2
Nitrogen	7 2	7 3	7 3			

Calculated for $C_{23}H_{26}N_2O_4$ Carbon 70 0, hydrogen 6 5, nitrogen 7 1

To determine the molecular weight by the freezing-point method was impracticable

because of insolubility in the proper liquids The boiling-point method also proved unsatisfactory, because the small amount of material precluded using a suitable apparatus like those of McCoy or Cotrell The figure obtained in one experiment was 125, calculated 394

Precipitating agents, except tannic acid, gave very satisfactory reactions with acidified aqueous solutions

Reagent	Precipitate
Mayer	Very small white granules
Sonnenschein	Amorphous, light blue
Scheibler	Amorphous, white
Wagner	Amorphous, brown
Wormley	Amorphous, yellow
Picric acid	Granular crystals
Platinum chloride	Small light yellow, granular crystals
Cold chloride	Amorphous yellow
Hydrobromic acid	Amorphous, white
Hydriodic acid	Amorphous brown

A few color reactions were noted, although no attempt was made to study these completely Froehde s reagent gave a green color changing to brown and then back to green Marquis' reagent yielded a green turning slowly to a brown Mandelin's reagent produced a yellow color which later became brown No reactions were obtained in the Vitali test, with concentrated ammonia water or in the fading purple test as for strychnine Nitric acid gave a blue-green color which soon changed to purple and finally faded Sulphuric acid produced a yellowish brown and finally a purple Hydrochloric acid gave a beautiful blue which later became green

The hydrochloride was prepared, by passing dry hydrogen chloride into a chloroformic solution, as a white, agglutinated mass which was very unstable and gave no definite melting point It was completely decomposed at 240° C Analysis by the usual methods gave 5 4 and 5 8 per cent of chlorine, compared to 8 2 per cent is calculated for a monohydrochloride

The small amount of material available prevented any further study, but plans are now being laid to collect larger quantities of root-bark and to examine the alkaloid more carefully, chemically and pharmacologically

Coloring Matter —Extracts of leaves, bark and root-bark contained coloring agents which did not respond to the Borntrager test, in spite of the fact that many of the Rhamnaceæ contain anthraquinone derivatives Aqueous or alcoholic extracts of the root-bark were of a bright red color, from which ammonia precipitated a gelatinous, purple substance This was soluble in acid to give a red solution, but was not soluble in any of the organic liquids Qualitatively it gave several reactions which are characteristic of anthraquinone derivatives and we plan to study it further

Dermatitis —In 1905, Rooney (1) described somewhat a dermatitis which was attributed to *Ceanothus velutinus*, and a number of persons in Washington have orally reported similar experiences In view of the wide-spread occurrence of this plant, it is very possible that many cases of poisoning laid to species of *Rhus* are in reality caused by *Ceanothus* With the aid of Drs Wm Clausen and Henry Odland, both dermatologists, it was found that such a dermatitis could be caused

on a small percentage of subjects by either the leaves or an ethereal extract of them, but that aqueous solutions are inactive One of the writers was continually affected during collection of material

The eruption appeared on the skin one or two days after contact The first symptoms were itching and burning, with subsequent redness, and finally vesicles appeared on the surface On the face the skin became bright red and the eyelids and surrounding tissues were markedly swollen These symptoms continued for two or three weeks after exposure and then gradually subsided Simultaneously, desquamation occurred in the form of small scales and large flakes of dried epidermis Treatment by the antigens of poison oak or ivy was of no prophylactic or curative value, but the conditions were relieved by the usual moist compresses and soothing lotions

SUMMARY

The leaves of *Ceanothus velutinus* present microscopically a peculiar structure which is not found in other species and may be related to the characteristic balsamic coating They furnish 0 14 to 0 21 per cent of an oil which is chiefly ethyl and cinnamyl cinnamates, with smaller amounts of salicylaldehyde, terpenes and esters of an unidentified alcohol with cinnamic and probably valeric acids The root-bark furnishes about 0 1 per cent of alkaloid, part of which was obtained in the crystalline state Analysis indicated the formula $C_{13}H_{26}N_2O_4$ Some study was made of its properties and reactions Reports of a dermatitis from the leaves were confirmed and the symptoms are described

THE INTERNATIONAL STANDARD FOR THE ŒSTRUS PRODUCING HORMONE

At the request of the officers of the Permanent Commission on Biological Standards of the Health Organizations of the League of Nations the Board of Trustees of the U S Pharmacopœial Convention has agreed to assume the responsibility for distributing the International Standard for the Œstrus-Producing Hormone in the United States Supplies of this material have just been received from the National Institute for Medical Research London where the International Standard has been prepared This Standard is now available for the use of manufacturers of preparations of this Hormone, for the purpose of establishing for their products a uniform potency in the terms of the International Unit one International unit consists of 0 0001 mg of the Hormone issued by the League of Nations This material is also available for those carrying out important therapeutic researches in this field

A memorandum suggesting the course to be followed in using the International Standard has also been supplied by Dr H H Dale Director of the National Institute for Medical Research Those who are interested in securing this memorandum or the International Standard, should communicate directly with E Fullerton Cook, Chairman of the U S P Committee of Revision 43rd Street and Woodland Avenue Philadelphia

BIBLIOGRAPHY OF PHARMACEUTICAL RESEARCH

Compiled by A G DuMez, Reporter on the Progress of Pharmacy

All articles in these lists will be presented in abstract form in the bound volumes of the Year Book, which is issued annually Those desiring abstracts immediately can obtain them for a fee of one dollar each by communicating with A G DuMez, University of Maryland School of Pharmacy, N W cor Lombard and Greene Sts , Baltimore, Maryland

COMPARISON OF KARAYA GUM AND TRAGACANTH *

L F GABEL

Karaya Gum (*Sterculia urens*) was formerly known as Indian Gum It comes chiefly from India The use of Karaya Gum in the preparation of toilet articles has increased in recent years This has been due to the discovery that Karaya possesses certain physical properties that make it superior to Tragacanth for some purposes

This laboratory has obtained data in regard to the comparative value of mucilages of Karaya and Tragacanth, and as the literature lacks information on this point, considered it worth while to publish the results

I KARAYA GUM DIFFERS FROM TRAGACANTH IN PHYSICAL AND CHEMICAL PROPERTIES AS SHOWN IN THE FOLLOWING TABLE

TABLE I

	Karaya	Tragacanth
Physical form	Lumps	Ribbons
Chief chemical principal	Gelose	Bassorin
Solubility in water	More soluble than Tragacanth	
Reaction	Acid (1 Gm requires 4 5 cc *N*/10 alkali to neutralize)	Acid (1 Gm requires 0 9 cc *N*/10 alkali to neutralize)
Appearance of solution in water	Translucent	Opalescent
50% Alcohol	Clear	Precipitates
Borax test (U S P)	Stringy and slimy	Not affected
Iodine T S	Colorless—free from starch	Blue color—starch present
Density	1 20	1 25

II MUCILAGE OF KARAYA GUM COMPARED WITH MUCILAGE OF TRAGACANTH

Mucilages of the gums were prepared according to the following formula

Powdered gum	42 grains
Glycerin (used as preservative)	5 oz av
Sufficient water to make	8 oz av

Tests were applied to the mucilages to note

1st Ability of the gum to form thick mucilage
2nd Effect of aging on the mucilage
3rd Differences in viscosity due to the method of manufacture, *i e*, 1st set of experiments prepared with heat 2nd set prepared by heating to boiling, 3rd set prepared by boiling two minutes 4th set prepared by boiling five minutes 5th set prepared by boiling ten minutes

* Section on Practical Pharmacy and Dispensing A PH A Madison meeting, 1933

In all experiments in which heat was used, the lot was allowed to cool and then sufficient water added to make 8 oz av of mucilage

The MacMichael Viscosimeter was used to note the variations in viscosity Readings were obtained with the following standards

Disc plunger
No 22 wire
Room temperature
8 r p m

The disc plunger is held or supported in contact with the mucilage by a standard No 22 wire The container holding the mucilage rotates at 8 revolutions per minute The resistance to the wire imparted by the viscosity of the mucilage is registered on a dial and the number of divisions indicated on the dial multiplied by 205 permits a mathematical comparison in terms of poises However, an easier comparison can be made by recording the divisions registered on the dial, as the poises run as high as 26,000, whereas the readings on the dial are simple numbers

TABLE II

Gum	Aging Period	Method of Manufacture: Made without Heat	Brought to Boil	Boiled Two Minutes	Boiled Five Minutes	Boiled Ten Minutes
Tragacanth	Original reading	17	19	39	61	61
Aleppo	After 3 months	73	84	90	108	101
No 1	After 10 months	93	117	140	120	115
Karaya	Original reading	14	35	20	21	25
Superior	After 3 months	26	34	27	28	26
Grade	After 10 months	20	19	15	15	10

The above table shows changes in viscosity during a ten month aging period

Comparison

1st Tragacanth produces a thicker mucilage
2nd Tragacanth Mucilage becomes thicker on aging, Karaya becomes thinner on aging
3rd A two minute boiling period is required to obtain thickest mucilages of Tragacanth
4th Application of heat in the preparation of mucilage of Karaya should be avoided

TABLE III

Gum	Aging Period	Treatment	Method of Manufacture. Made without Heat	Boiled Two Minutes	Boiled Five Minutes	Boiled Ten Minutes
	Original	W/o neutralization	91	140	130	110
Tragacanth	reading	Neutralized	85	49	27	27
Aleppo	After two	W/o neutralization	128	140	138	117
No 1	months	Neutralized	160	55	30	29
	After four	W/o neutralization	145	150	150	120
	months	Neutralized	147	48	28	26
	Original	W/o neutralization	68	63	56	46
Karaya	reading	Neutralized	93			
Superior	After two	W/o neutralization	59	63	60	55
Grade	months	Neutralized	64	69	53	44
	After four	W/o neutralization	35	45	40	33
	months	Neutralized	36	27	25	21

The preceding experiments were repeated with three different samples of high grade Karaya and Tragacanth gums, and although slight variations occurred in viscosity, the general results were the same

Karaya gum is five times as acid as Tragacanth Because of the possibility of incompatibility due to the acid, and also to note effect of neutralization, a series of experiments was made in which one-half of each experiment was neutralized The standard formula for the mucilage used in obtaining results for Table II was again used, with a like series neutralized with potassium hydroxide The same standards used in obtaining data for Table II were used in Table III

There is an interesting observation drawn from the above results, *i e*, neutralized mucilages of Tragacanth made with the aid of heat show a stable viscosity, though decidedly less viscous than the mucilage made without neutralization and without heat

This establishes the fact that the acid in Tragacanth effects a decrease in mucilaginous properties when heat is applied to the powdered gum or mucilage Heat should be avoided as much as possible in powdering gum Tragacanth

Because neutralized Karaya mucilage becomes stringy, the results in the above table are of no consequence

In order to present the comparison of the two mucilages in another way which is more applicable, experiments were prepared containing ¾%, 1%, 1½% and 2% of the gums, respectively The solutions were prepared without aid of heat

As the viscosity as determined by the viscosimeter does not definitely indicate the fluidity of a preparation, it was necessary to introduce another test to note this physical property

The standard used to obtain the following data consisted of a glass tube 36 inches long, with a bore of 1 centimeter The number of seconds required for a 30-inch column of mucilage to flow from the tube held in a vertical position was noted

TABLE IV

		% Strength of Solution of Gums Standards—MacMichael's Viscosimeter—No 22 Wire Disc Plunger—8 R P M—No Divisions Revolved Flow Test—30 Inch Column—1 Cm Bore No of Seconds Required to Flow							
		¾%		1%		1½%		2%	
Gum	Aging Period	Viscosimer	Flow Test	Viscosimer	Flow Test	Viscosimer	Flow Test	Viscosimer	Flow Test
Tragacanth	Original reading	11		30		72		211	
Aleppa	After 4 months	18		43		87		235	
No 1	After 6 months	20	6	47	29	94	140	236	
Karaya	Original reading	151		28		64		121	
Superior	After 4 months	8		21		35		91	
Grade	After 6 months	6		13	1	19	3	55	23

Three samples of each gum were tested as shown in the above table and the results were similar

The above results again show that aging increases the viscosity of Tragacanth solution and decreases the viscosity of Karaya solution

Based on the flow test, a 1% solution of Tragacanth has approximately the fluidity of a 2% Karaya solution after aging about six months

CONCLUSIONS

1 Tragacanth has greater mucilaginous properties than Karaya It is necessary to use fully twice as much Karaya to obtain a comparative thick mucilage with Tragacanth

2 Maximum viscosity is obtained by boiling the Tragacanth mucilage two minutes, Karaya mucilage by manufacture without the aid of heat

3 The greater acidity of Karaya should be considered in pharmaceutical preparations as a source of incompatibility

4 Tragacanth mucilage becomes thicker on aging, Karaya mucilage becomes thinner on aging

Karaya possesses the following advantages over Tragacanth

1 More readily soluble One per cent of Karaya can be completely dissolved in water in 30 minutes

2 Karaya mucilage applied to the skin produces a softer effect than Tragacanth

3 Karaya is preferable to Tragacanth when used in hair preparations

Tragacanth produces a very stiff effect to the hair, whereas Karaya spreads better and keeps the hair in place without the conspicuous stiff "board" effect common to Tragacanth hair products

LIQUOR CALCIS SULPHURATÆ *

BY R A CAIN[1] AND H A LANGENHAN [2]

PRELIMINARY REPORT

Experience in the preparation of Liquor Calcis Sulphuratæ N F has shown that it is almost impossible to obtain a solution of uniform strength by following the N F directions Not only do the finished solutions vary in strength when prepared by different members of a class, but also when made by the same person

The purpose of this investigation was to determine, if possible, whether or not the quantities of lime and sulphur could be reduced, and to outline a method whereby a finished product of a uniform strength could be obtained

A total of 16 solutions was prepared, some according to the directions in the N F while in others the quantities of the ingredients were altered as well as the technique used in preparing the solutions

Two solutions were made according to the N F directions, *i e*, by adding a mixture consisting of 165 Gm of lime and 250 Gm of sulphur to 1750 cc of boiling water The mixture was boiled and reduced to 1000 cc, at which volume it was maintained, while boiling, by the frequent addition of water The mixture was allowed to cool and finally strained through muslin The finished solutions were

* Section on Practical Pharmacy and Dispensing, Madison meeting, 1933

[1] Instructor in Pharmacy

[2] Professor of Pharmacy

assayed for their lime and sulphur content, the results of which are shown in the following table

Solution No	Cc. Collected	% CaO	% S	Total CaO Gm	Total S Gm	% CaO Used	% S Used
1	540 0	16 42	25 9	88 66	139 86	53 73	53 94
2	590 0	10 94	22 3	64 54	131 57	39 11	52 62
Av	565 0	13 68	24 1	76 60	135 71	46 42	54 28

It will be noted that although both solutions were prepared in a similar manner, the amount of finished product finally collected was 50 cc greater in solution No 2 Likewise, the lime and sulphur content varied a great deal, a variation which could not possibly be due to the difference in the volumes of the solutions collected Reference to the table shows that approximately 50% of the lime and sulphur were actually used in the preparation of the solutions

Since nearly half of the original lime and sulphur remained after preparing the solution, it was decided to prepare another series of solutions starting with the same quantities of lime and sulphur, but increasing the quantity of water The increase in the amount of water to be added was based upon the assumption that if starting with 1500 cc of water and concentration to a total volume 1000 cc , an average of approximately 550 cc of finished solution could be obtained, then by using 2250 cc and concentrating to a total of 1450 cc it should be possible to collect approximately 1000 cc of finished product having a lime and sulphur content which, theoretically at least, would differ only slightly from the N F preparation The results obtained are given in the following tables

Solution No	Cc. Collected	% CaO	% S	Total CaO Gm	Total S Gm	% CaO Used	% S Used
7	922 5	10 18	16 20	93 85	149 36	56 87	59 74
8	990 0	8 4	15 08	83 16	149 29	50 40	59 71
9	950 0	8 96	15 48	85 12	147 06	51 59	58 82
10	875 0	8 12	14 86	71 05	130 02	43 06	52 07
Av	934 3	8 91	15 40	83 29	143 93	50 48	57 47

The results show that by increasing the amount of water in order that the volume of the finished product would measure approximately 1000 cc there was a decrease of nearly 5 per cent in the lime and nearly 10 per cent in the sulphur content Taking into consideration the amounts of lime and sulphur actually used in preparing the solutions, it will be noted that whereas in the N F solutions about 46 per cent lime and 55 per cent sulphur were used, in this case the amounts dissolved in solution increased to an average of 50 and 57 per cent, respectively Apparently, therefore, the addition of a larger quantity of water at the beginning of the preparation only slightly increased the total quantities of lime and sulphur which would go into solution Under this condition it is obvious that the percentage strengths of the lime and sulphur would be much greater in the N F solutions

Solutions were again prepared, this time the technique was varied as well as the amounts of the ingredients Instead of adding the N F quantities of lime and sulphur to 1750 cc of water and concentrating down to a total volume of 1000 cc , the formula was computed on the basis of a 1000 cc of water added at the beginning This required 94 28 Gm of lime and 142 85 Gm of sulphur In order to maintain a constant volume, the mixture was boiled with a reflux condenser for three and one-half hours, the length of time required to prepare the solution accord-

ing to the N F directions A volume of 950 cc of finished solution was obtained which assayed 7 64 per cent lime and 11 68 per cent sulphur, thereby using up 77 21 per cent of the original lime and 78 14 per cent of the sulphur Although the percentage strengths of the active ingredients were somewhat lower than the N F products, at the same time the total quantity dissolved was much greater In using smaller quantities of the ingredients less liquid was held in contact with the residue thereby making it possible to collect nearly as much of the finished product as the original water added By reducing the quantities of lime and sulphur to one-third the N F formula and adding 1000 cc of water and preparing the solution in the same manner as the above, 932 cc of finished product were obtained which assayed 4 34 per cent lime and 5 0 per cent sulphur The total quantities of lime and sulphur dissolved amounted to 77 22 and 97 02 per cent, respectively Decreasing the original quantities of lime and sulphur caused a corresponding decrease in their percentage in the finished product It will be noted that practically all of the sulphur went into solution Increasing the original quantities of lime and sulphur failed to materially increase their relative percentage strengths in the finished solution This was shown by the fact that when 215 Gm of lime and 326 Gm of sulphur were used the per cent of lime and sulphur in the finished solution was 9 36 and 19 32 per cent, respectively The total per cent of lime and sulphur used was 40 05 and 54 52, respectively It is possible that a much larger quantity of soluble sulphides were formed but due to the bulk of the residue so much liquid was absorbed that the remaining liquid was insufficient to dissolve them

In order to determine the amount of soluble sulphides which were presumably left in the residue after the preparation of the solution, and which were not dissolved, due to the lack of sufficient liquid, a series of solutions were prepared according to the N F directions

The residue left on preparing the first solution was added to more water and the concentrating and boiling for one hour repeated, and so on, 1750 cc of water were added in each case to the left-over residues in preparing solutions Nos 5 and 6 In No 12, 2250 cc were added to the original ingredients, 500 cc in 12*b*, and 1000 cc in the cases of 12*c*, *d* and *e* The following table offers a summary of the results of this experiment

Solution No	Cc Collected	% CaO	% S	Total CaO Gm	Total S Gm	% CaO Used	% S Used
4	590 0	10 90	22 30	64 54	131 57	39 11	52 62
5	650 0	8 60	7 79	55 90	50 60	55 64	42 72
6	740 0	5 72	2 64	42 32	19 53	94 97	28 79
12*a*	1085 0	2 52	1 69	27 34	18 33	16 57	7 33
12*b*	500 0	6 14	6 90	30 70	34 50	22 30	14 89
12*c*	985 0	3 86	2 54	38 02	25 02	35 54	12 68
12*d*	1050 0	3 50	0 52	36 75	5 46	53 30	3 17
12*e*	840 0	1 24	0 14	10 41	1 17	32 33	0 70

The results seem to indicate that a considerable quantity of sulphides can be dissolved by repeated treatment of the residues with water Reference to solutions Nos 4, 5 and 6 will illustrate this point

From the residue left on preparing solution No 4 there was obtained 8 60 per cent lime and 7 79 per cent sulphur, and when the residue from No 5 was in turn treated with water and additional 5 72 per cent lime and 1 69 per cent sulphur was

recovered There was dissolved, therefore, from the original residue left after the preparation of solution No 4, a total of 14 32 per cent lime and 10 43 per cent sulphur in a total of 1390 cc of finished product Summing up, the original residue yielded a total of 25 26 per cent lime and 32 73 per cent sulphur by the foregoing treatment, and 1980 cc of finished product were obtained The series 12*a*, *b*, *c*, *d* and *e*, showed substantially the same results As a result of repeated treatments of the residues in this series with water, 4460 cc of finished product were obtained before practically all of the lime and sulphur in soluble form had been extracted It will be noted that the final solution prepared, No 12*e*, contained only a small amount of dissolved lime together with just a trace of sulphur

It is quite apparent that the soluble sulphides, which were subsequently dissolved in the finished product by the repeated addition of water to the residues, were formed, during the concentrating and boiling of the original mixture, and that further treatment of the residue with water supplied the necessary solvent If the assumption just made is correct a large quantity of the soluble sulphides, remaining in the residue after removal of the concentrated sulphide solution, could be obtained by washing the residue with additional hot or cold water In this manner a definite quantity of finished product could be collected each time It would seem that this procedure would be much more satisfactory than that of collecting only the liquid which separates from the residue, the amounts of which cannot help but vary each time the preparation is made The N F directions specify that the mixture of lime, sulphur and water be concentrated to a volume of 1000 cc and maintained at this volume, while boiling, for one hour Experience has shown that it is quite difficult, if not almost impossible to keep the volume constant The solution necessarily has to be prepared in large containers and any little variation in volume represents a relatively large increase or decrease in the amount of finished product obtained, and hence the percentage strengths of the lime and sulphur will seldom if ever be the same in different solutions

This investigation is being continued An analysis of the residues and of crystals forming in the solution is now being carried on

UNIVERSITY OF WASHINGTON COLLEGE
OF PHARMACY, SEATTLE

A COMPARISON OF RESULTS OBTAINED BY TWO METHODS OF INSTRUCTION EMPLOYED IN TEACHING PHARMACEUTICAL CHEMISTRY *

BY CHARLES H RODGERS

In the presentation of the subject matter of any course of study an instructor is confronted with the pedagogical problem of how to present the particular course material in order to get the best results with an especial student group immediately at hand To correctly determine what is the best method that should be used for a certain student group is not a simple matter, especially since the instructor usually has little or no advanced information on the average scholastic ability, cooperative desire and interest of the students in the group An experienced instructor will

* Section on Education and Legislation A PH A Madison meeting, 1933

usually ' feel his way" with a new class, departing from the scheduled lecture and quiz periods by increasing the one and decreasing the other, as he thinks best, until he has found the combination that he believes to be the most satisfactory

The problem is further complicated when the quantity of material covered by a course of study is very large and the number of lecture, quiz and laboratory hours assigned to the course is small The course in which comparative studies of the results of several teaching methods has been made is designated as Pharmaceutical Chemistry Three lectures, one quiz and three laboratory periods of fifty minutes each for the winter quarter of 12 weeks, and three lectures, one quiz and four laboratory periods of fifty minutes each for the spring quarter of 12 weeks, or a total of 180 actual hours, are allotted to this course The course is intended to cover those facts about the elements and their compounds which are of especial interest to pharmacists Such a consideration will naturally include official Latin and English titles, common names and synonyms, empirical and structural formulas, official definitions and rubrics, descriptions and physical properties, tests for identity and purity, pharmacological action of ions, chemistry of pharmaceutical preparations, industrial methods of manufacture, etc The laboratory work includes the manufacture of a number of chemical compounds by processes as nearly like the actual industrial methods as possible The student is provided with a textbook covering the material

The vast amount of material in such a course precludes a *detailed* lecture presentation by the instructor and still reserves sufficient time for satisfactory quizzing and laboratory work When the *most important* facts *only* are lectured upon and one oral or written quiz conducted once a week, it has been found that most students delay studying their notes made in lecture and also that portion of their texts covering the subject matter of the lecture until the evening immediately preceding the weekly quiz This they *would* do despite advices to study concurrently with the lectures This was proven time and again by giving unannounced quizzes upon the material presented in lecture on the preceding day and also by students confessing that they had to study in this way because of a heavy schedule The average of student grades made on three unannounced written quizzes was about 62 per cent with only eighteen (18) making passing marks of seventy or better However, when a similar quiz was *announced*, the general average was 79 2 per cent with only twenty per cent of the class having grades of less than 70 per cent but greater than 61 per cent (61%) When the same identical written quiz was given unannounced two weeks later, the examination average showed a general decrease of approximately 10 per cent When given after four weeks, the decrease was only 12 per cent Sufficient data were collected to show that announced quizzes given frequently had the coercive effect of making students study concurrently with the lectures

The assignment of daily lessons from the text and utilizing the entire time scheduled for didactic work for oral quizzing was tried for several weeks When questions dealing with O L T formulas, common names, etc , were asked, the oral quiz marks were quite satisfactory However, when the questions had to do with technology, ion actions, processes, etc , the answers showed a distinct lack of clear understanding This emphasized the necessity of explanatory lectures on certain phases of the work

During the third quarter of the 1932–1933 school year it was decided to try the following method The daily assignment of work to be covered on both lecture and quiz days during weekly periods was posted on each preceding Thursday Immediately upon reporting for class the students wrote a twenty-minute quiz on the material assigned for that particular day The papers were then passed to neighboring students who corrected them during the next thirty minutes, which the instructor devoted to a lecture covering all of the questions asked in the quiz immediately preceding the lecture and, also, to any other material in the assignment needing explanation but not covered by the quiz The papers were handed in at the close of the period and carefully reviewed by the instructor, who then returned them to the students for study

After pursuing this plan (Plan A) for six weeks an examination on the subject matter covered in that time was announced The average grades for these papers was 79 8 per cent On the other hand, when three full period lectures and one oral quiz each week were given for six weeks (Plan B) and an announced quiz given on the material covered, the average for the class was only 62 56 per cent When Plan "A" was employed, the student average grade on the announced quiz showed 17 24 per cent higher than that obtained when the second plan, "B," was used

The estimate of time spent by students in the immediate preparation for the announced-written-quiz given after using Plan A was one and one-half ($1^1/_2$) hours per student (Data obtained from approximately 50% of the students in the class —students selected at random) Inquiries as to the time spent in the immediate preparation for the announced-written-quiz given after following Plan B showed an average of approximately three hours per student There can be no question but that students spent more time in the aggregate preparing for the announced-written-examination given under Plan A and that this time was put in uniformly throughout the preceding six weeks (each night preparing for a 20 minute written test the following day), and furthermore resulted in obviating the necessity of devoting a long study period immediately before the written examination

The "written-quiz-lecture" system, which we have used successfully, is not advanced as a new pedagogical method As previously stated, it is the desire of every true teacher to use that particular method of presenting his subject which will result in the greatest benefit to his students From the composite data collected to date, as well as from the observed general results, we believe that this method is by far the best one employed by us in teaching Pharmaceutical Chemistry This plan does not necessarily work for other courses For example, we have tried the method for several weeks in a course in Operative Pharmacy but have come to the conclusion that for this course the lecture-oral quiz plan gives better results

It is our opinion that the written-quiz-lecture system is a mildly coercive way of inducing students to work for themselves and, when this is accomplished, the problem of the instructor is materially simplified

DETERMINATION OF THE REASONABLE OR PERMISSIBLE MARGIN OF ERROR IN DISPENSING II OINTMENTS *

BY MARVIN J ANDREWS [1]

INTRODUCTION

In the first paper of this series,[2] a report was made of studies undertaken to determine the magnitude and frequency of errors made in the dispensing of powders and capsules This, the second paper of the series, deals with the errors encountered in the dispensing of ointments

Ointments called for on prescriptions are usually prepared by mixing the ingredients on an ointment slab or pill tile with the aid of a spatula In some cases the nature of the ingredients make it necessary to use a mortar and pestle, and occasionally a slab and muller The bases most frequently ordered are petrolatum, white petrolatum, lard, benzoinated lard, anhydrous lanolin, lanolin, a mixture of lanolin and petrolatum, or a mixture of the above bases Ointments are usually dispensed in glass or porcelain jars, less frequently in collapsible tubes

For the purpose of this study, the different types of ointment prescriptions which the pharmacist is ordinarily called upon to dispense were divided into three classes, namely (1) Those which require no handling further than that necessary to transfer the ointment from a stock container to a dispensing jar (2) Those in which compounding involves the incorporation of a liquid with a fatty or hydrocarbon base (3) Those in which the compounding involves the incorporation of a solid with a fatty or hydrocarbon base

With respect to the magnitude and frequency of the error to be expected in the dispensing of these three types, the capacity of the container, the base used, and the method of preparation of the ointment seem to be the most important factors to be considered To determine the extent to which each of these factors contribute to the total error, the following studies were undertaken

EXPERIMENTAL PART

Three series of tests were made The first series of tests was carried out using containers of different capacities, but made by the same manufacturer The objective in this series was to determine the effect on capacity of the following conditions

(1) Difference in nature of ointment bases (*a*) Petrolatum, (*b*) lanolin, (*c*) lanolin and petrolatum, and (*d*) benzoinated lard were used for this purpose

(2) Trituration of each of the above bases on an ointment slab for five and ten minute periods previous to packing

(3) Incorporation of a liquid with each of the above bases

(4) Incorporation of a solid with each of the above bases

(5) Size of jar that is half ounce one ounce and two ounce

The principal objective of the second series of tests was to determine the varia

[2] JOUR A PH A , 22 (1933), 755, and 22 (1933), 838

tion in the capacities of jars manufactured by each of the four manufacturers from whom they were purchased

The objective of the third series of tests was to determine the variation in the capacities of jars purchased at random from retail pharmacists in the City of Baltimore

In the actual performance of these tests, the ointment jars were filled in each case by 65 members of the senior class in dispensing pharmacy at the School of Pharmacy of the University of Maryland under working conditions similar to those prevailing in the better type of pharmacies The filled ointment jars were checked for capacity by weighing on a prescription balance, and the standard deviation computed from the results obtained

In the tests made to determine the variation in capacity due to the nature of the base, one series of jars was filled by melting and pouring the material into them, and a second series was filled by packing the base as received into them with the aid of a spatula In filling the jars with melted base, the students were instructed to keep the temperature for melting as low as possible, and in the series filled with the base as received instructions were given to pack so as to eliminate air spaces in so far as possible

TABLE I—EFFECT OF DIFFERENT CONDITIONS IN PACKING OINTMENT JARS ON THE STANDARD DEVIATION

Ointment Base	Treatment and Packing	1/2-Ounce Jar	Average Capacity in Grains of 65 Jars	S D in Grains	Percentage Deviation
Petrolatum	Packed solid		180	21 08	11 71
Lanolin	Packed solid		202	19 14	9 47

Petrolatum	5% ZnO incorporated		190	19 27	10 14
Lanolin	5% ZnO incorporated		207	24 57	11 87
Lan and Pet	5% ZnO incorporated		198	23 33	11 78
Benz Lard	5% ZnO incorporated		210	22 95	10 93

It was assumed that the mixing of air with an ointment base would effect materially the weight of the contents of a jar filled with the base To determine if this was actually the case instructions were given to triturate the above-mentioned

bases on an ointment slab with the aid of a spatula for 5- and 10-minute periods previous to packing

In the tests intended to show the effect of the incorporation of a liquid with an ointment base, the students were instructed to use 5 per cent by weight of distilled water

In the tests intended to show the effect of the incorporation of a solid with an ointment base the students were instructed to use 5 per cent by weight of zinc oxide

In the filling of the jars students were instructed to put in an excess of material and level off the top by running the edge of a spatula over it They were further instructed to remove any adhering material by carefully wiping the outside of the jar

The results of the first series of tests are presented in Tables I, II and III

TABLE II —EFFECT OF DIFFERENT CONDITIONS IN PACKING OINTMENT JARS ON THE STANDARD DEVIATION

Ointment Base	Treatment and Packing	1 Ounce Jar	Average Capacity in Grains of 65 Jars	S D in Grain	Percentage Deviation
Petrolatum	Packed solid		369	22 62	6 13
Lanolin	Packed solid		401	32 14	8 01
Lan and Pet	Packed solid		396	29 93	7 56
Benz Lard	Packed solid		405	32 39	7 99
Petrolatum	Melted and poured		390	20 60	5 28
Lanolin	Melted and poured		417	26 24	6 29
Lan and Pet	Melted and poured		415	31 09	7 49
Benz Lard	Melted and poured		397	39 04	9 83
Petrolatum	Trit on slab 5 min		354	31 35	8 86
Petrolatum	Trit on slab 10 min		355	31 63	8 91
Lanolin	Trit on slab 5 min		386	31 25	8 09
Lanolin	Trit on slab 10 min		373	36 80	9 87
Lan and Pet	Trit on slab 5 min		373	45 37	12 16
Lan and Pet	Trit on slab 10 min		370	47 10	12 73
Benz Lard	Trit on slab 5 min		392	36 88	9 41
Benz Lard	Trit on slab 10 min		374	38 28	10 24
Petrolatum	5% water incorporated		362	35 11	9 69
Lanolin	5% water incorporated		396	39 00	9 85
Lan and Pet	5% water incorporated		390	33 30	8 54
Benz Lard	5% water incorporated		399	34 30	8 59
Petrolatum	5% ZnO incorporated		379	34 34	9 09
Lanolin	5% ZnO incorporated		411	37 48	9 12
Lan and Pet	5% ZnO incorporated		389	27 23	7 00
Benz Lard	5% ZnO incorporated		408	40 27	9 87

The accompanying tabulations show that the average capacity in grains increases for the 65 jars packed with the solid base in the following order petrolatum, 50 per cent mixture of lanolin and petrolatum, lanolin, benzoinated lard When the base is first melted and then poured into the jars, the increase in the capacity of the jars is in the following order petrolatum, benzoinated lard, 50 per cent mixture of lanolin and petrolatum, lanolin Likewise, the jars when filled

by melting and pouring show a greater capacity than when filled with the same base by packing in the solid condition, except in the case of benzoinated lard

The increase in capacity when the base is melted and poured is no doubt due to the fact that occluded air is driven out in heating, and to the fact that air-pockets are not formed in filling as is the case when the base is packed as solid

TABLE III —EFFECT OF DIFFERENT CONDITIONS IN PACKING OINTMENT JARS ON THE STANDARD DEVIATION

Ointment Base	Treatment and Packing	2 Ounce Jar	Average Capacity in Grains of 65 Jars	S D in Grains	Percentage Deviation
Petrolatum	Packed solid		735	39 53	5 38
Lanolin	Packed solid		793	52 86	6 67
Lan and Pet	Packed solid		769	46 19	6 00
Benz Lard	Packed solid		816	44 04	5 40
Petrolatum	Melted and poured		773	28 20	3 65
Lanolin	Melted and poured		831	34 51	4 15
Lan and Pet	Melted and poured		804	38 48	4 79
Benz Lard	Melted and poured		774	55 32	7 15
Petrolatum	Trit on slab 5 min		712	58 62	8 23
Petrolatum	Trit on slab 10 min		707	54 31	7 68
Lanolin	Trit on slab 5 min		776	58 73	7 57
Lanolin	Trit on slab 10 min		752	57 92	7 70
Lan and Pet	Trit on slab 5 min		747	53 89	7 21
Lan and Pet	Trit on slab 10 min		730	54 39	7 45
Benz Lard	Trit on slab 5 min		773	52 65	6 81
Benz Lard	Trit on slab 10 min		741	68 18	9 20
Petrolatum	5% water incorporated		733	39 06	5 33
Lanolin	5% water incorporated		775	58 15	7 50
Lan and Pet	5% water incorporated		779	45 86	5 89
Benz Lard	5% water incorporated		786	53 91	6 86
Petrolatum	5% ZnO incorporated		760	51 33	6 75
Lanolin	5% ZnO incorporated		808	57 63	7 13
Lan and Pet	5% ZnO incorporated		794	44 63	5 62
Benz Lard	5% ZnO incorporated		819	48 65	5 94

The decrease in capacity when the jars are filled with benzoinated lard by melting and pouring is due, in part at least, to loss of water by evaporation The expansion of the lard on heating also accounted for a part of the decrease in weight

The standard deviation in the case of the jars filled with petrolatum, 50 per cent lanolin and petrolatum mixture, and lanolin is greater in each instance when the base is packed in the solid condition than when melted and poured The magnitude of the error as shown by the percentage deviation varies inversely to the size of the jar

The direction of the standard deviation in the case of the jars filled with benzoinated lard is directly opposite to that found for the other three bases, that is, the same volume of base weighs more when packed in the solid condition than when melted and poured in the jar

The most important point brought out by the data in the above tables is that the frequency and magnitude of error is greater in the cases where the jars are filled with ointment in the solid state than in the cases where the filling is accomplished by melting and pouring

Unfortunately, in actual drug store practice, the majority of prescriptions for

small quantities of ointments are filled by triturating the ingredients on a slab and packing the finished ointment into a jar with the aid of a spatula This procedure is followed because the application of heat has a deleterious effect on the ingredients of certain ointments and because the preparation of an ointment by fusion requires that it be allowed to stand until it congeals before it is given to the patient, who is usually in the store waiting for it

The tabulated data given above show further that the capacity of a jar by weight is decreased by triturating the ointment on a slab previous to packing in the solid state No doubt this is due to the incorporation of air with the ointment base, thereby increasing its bulk and lowering its specific gravity The time for which the material is triturated also seems to be an important factor, since in practically all cases the greatest decrease in capacity was shown where the period of trituration was ten minutes instead of five In the case of benzoinated lard the fact that trituration results in liquefaction may also be a factor

The incorporation of a liquid of comparatively low specific gravity and which does not readily mix with the base, such as water, appears to produce a decrease in capacity The cause for this has not been definitely determined It is believed, however, that the condition is due to emulsification and the occlusion of air The effect produced by a liquid which is completely miscible with the ointment was not determined

In cases where the specific gravity of the liquid is higher than that of the ointment base and where the liquid is insoluble in the base, an increase in capacity may be expected In the case of the official mercury ointments, for instance, where the mercury content is high, the increase in capacity is enormous as shown in the following table

TABLE IV —CAPACITIES OF OINTMENT JARS FOR MERCURY OINTMENTS

Size of Container	Petrolatum	Mild Mercurial Ointment	Stronger Mercurial Ointment
½ ounce	240 grams	343 grams	425 grams
1 ounce	480 grams	663 grams	838 grams
2 ounce	960 grams	1381 grams	1688 grams

In the case of the incorporation of a solid with the ointment base, it would naturally be expected that the capacity of the ointment jar by weight to be increased if the specific gravity of the solid were higher than that of the base and vice versa if it were lower than that of the base The results obtained in the tests carried out with 5 per cent zinc oxide ointment show that these expectations are realized in so far, at least, as solids heavier than the ointment base are concerned The increase in capacity, however, is not constant but varies with the ointment base used as shown in the above table Evidently physical properties other than specific gravity are factors to be reckoned with, the solubility of the solid in the ointment base for instance Unfortunately, tests were not made with solids lighter than the base, so that actual data on ointments of this type cannot be given at present

For the purpose of making it possible to compare the results presented in Tables I to III with similar data that may have been published, but which have not been expressed in terms of the standard deviation, the per cent of deviation from the average has been calculated and is given in Tables V, VI and VII which follow

TABLE V —PERCENTAGE DEVIATION FROM THE AVERAGE WEIGHT OF ONE-HALF OUNCE JARS

Ointment Base	Treatment and Packing	Average Capacity in Grains of 65 Jars	Deviation from the Average Weight of 65 Completely Filled ½ Ounce Jars: 5% or Less	From 5% Plus to 10%	From 10% Plus to 15%	From 15% Plus to 20%	Over 20%
Petrolatum	Packed solid	180	46 10%	30 76%	12 30%	6 15%	4 61%

Petrolatum	Trit on slab 5 min	178	38 45%	35 37%	12 30%	10 78%	3 08%
Petrolatum	Trit on slab 10 min	177	32 30%	27 68%	21 53%	7 69%	10 77%
Lanolin	Trit on slab 5 min	191	38 45%	26 15%	12 30%	10 77%	12 30%
Lanolin	Trit on slab 10 min	185	40 00%	24 61%	16 92%	6 15%	12 30%
Lan and Pet	Trit on slab 5 min	186	46 10%	26 15%	10 77%	4 61%	12 30%
Lan and Pet.	Trit on slab 10 min	184	43 06%	30 76%	12 30%	3 08%	10 77%
Benz Lard	Trit. on slab 5 min	195	55 37%	24 61%	12 30%	3 08%	4 61%
Benz Lard	Trit on slab 10 min	187	26 15%	29 22%	21 53%	10 77%	12 30%
Petrolatum	5% water incorporated	180	24 61%	29 22%	23 07%	10 77%	12 30%
Lanolin	5% water incorporated	197	43 06%	32 30%	16 92%	4 61%	3 08%
Lan and Pet	5% water incorporated	192	49 22%	33 84%	9 23%	3 08%	4 61%
Benz Lard	5% water incorporated	200	53 83%	16 92%	12 30%	6 15%	10 77%
Petrolatum	5% ZnO incorporated	190	33 84%	41 53%	16 92%	6 15%	1 54%
Lanolin	5% ZnO incorporated	207	50 75%	27 68%	12 30%	4 61%	4 61%
Lan and Pet	5% ZnO incorporated	198	36 91%	32 30%	12 30%	6 15%	12 30%
Benz Lard	5% ZnO incorporated	210	52 30%	23 07%	15 38%	3 08%	6 15%

In Table V, the percentage deviations from the average weight of ½ ounce jars show that in a large majority of cases the error is 15 per cent or greater, where the material filled into the jars was petrolatum, lanolin or 50 per cent lanolin and petrolatum mixture, and where the jars were filled by melting and pouring If the filling is done by packing in the solid state, the error in the majority of cases is 20 per cent or more If benzoinated lard is the base used, the error in the large majority of cases is 20 per cent or more, when the filling is done by either of the foregoing methods

In Tables VI and VII, the percentage deviations from the average weight of 1- and 2-ounce jars, respectively, show that in a majority of cases the error falls within 10 per cent when the base is melted and poured into the jars whereas the error is 15 per cent when the base is packed in the solid condition, or when other ingredients are incorporated with the base prior to transferring it to the jar When benzoinated lard is the base used, the error is 20 per cent in the case of one-ounce jars, and 15 per cent in the case of two ounce jars

TABLE VI —PERCENTAGE DEVIATION FROM THE AVERAGE WEIGHT OF ONE OUNCE JARS

Ointment Base	Treatment and Packing	Average Capacity in Grains of 65 Jars	Deviation from the Average Weight of 65 Completely Filled 1 Ounce Jars: 5% or Less	From 5% Plus to 10%	From 10% Plus to 15%	From 15% Plus to 20%	Over 20%

DISPLAY OF DENTAL ITEMS OF THE NATIONAL FORMULARY VI

BY RALPH E TERRY *

Occupying a prominent space in the display of *Dental Pharmacology* at the Mid Winter meeting of the Chicago Dental Society held at the Stevens Hotel, February 26th to March 1st, the Dental Items of the National Formulary VI attracted much attention The Mid-Winter meeting of the Chicago Dental Society attracts members of the dental profession from the entire middle west and visitors from the entire country At the meeting just held, more than 3500 registrants were present

As a part of the scientific exhibits, the College of Pharmacy of the University of Illinois prepared and displayed a number of materials of interest to dental practitioners The exhibit was planned with the cooperation of Professor Gathercoal and Dr Blayney of the Dental Sub-committee It consisted of three sections and occupied 40 feet of wall space Special glassware was provided for the exhibit and no expense was spared to make it as neat and attractive as possible About one hundred placards were used, and nearly that many individual items were displayed

One of the sections consisted of the mouth wash or rinse formulas suggested by Dean Geo C Schicks of Rutgers University, College of Pharmacy, who has been active in this work for some time Three National Formulary items were used, Liquor Antisepticus Liquor Aromaticus Alkalinus and Liquor Sodii Boratis Compositus In addition, four mouth rinse formulas furnished by Dean Schicks were featured Half liter testing bottles were provided and small paper cups made it possible for those interested to test the products Much interest was evinced over this section of the display

The second part of the display consisted of a series of typical dental prescriptions such as analgesics anodynes, sedatives stimulants and local anesthetics These were given on cards as formulas and the finished product was shown In addition a number of simples such as amyl nitrite, ether and other substances were shown This section was planned by Dr Blayney to demonstrate the proper manner of prescribing those official medicinal materials of value to the dentist

The third section of the display consisted of the dental formulas of the National Formulary VI Again the finished product was shown with the formula given on a card Grouped around each product, the materials needed to make each formula were shown This section of the display caused much interest, for the dental profession is becoming very much awakened to the need for knowing what it is using in the practice of dentistry Dental preparations of the National

* Member of the Faculty of University of Illinois College of Pharmacy

Formulary were exhibited The basic idea of this section was to bring to the dentist the work of the N F Dental Sub-committee to date that he might personally examine the preparations and note the formulas as recommended by this Sub-committee and now admitted to N F VI A number of suggestions were made by various dentists regarding these preparations and their uses

A four-page booklet describing U S P and N F products of interest to dentists was published by the AMERICAN PHARMACEUTICAL ASSOCIATION and about thirteen hundred were distributed to interested dentists, care being taken to keep them from the general public Many dentists were pleased to know that formulas for these preparations will be made available to them in the National Formulary VI, and a rather constant question was "when will the book be published?" Formulas of the booklet follow

DENTAL PREPARATIONS OF THE NATIONAL FORMULARY EXHIBITED

Anodyne Paste Dressing—This contains Acetylsalicylic acid Eugenol and Balsam of Peru made up into a paste Used as an anodyne dressing in painful tooth sockets

Dental Liniment of Aconite and Iodine—This formula contains Iodine, Fluidextract of Aconite and Alcohol Used as a counter irritant in acute non septic apical pericementitis Cautiously paint on the gum to avoid undue absorption of an excessive amount of aconitine

Dental Anodyne—Oil of Clove fortified with chlorbutanol presents a splendid local anesthetic used for temporary relief in acute pulpitis

Glycerite of Iodine and Zinc Iodide—The zinc iodide and the iodine offer a stable astringent preparation possessing full antiseptic powers

Camphor Phenol Sodium—Phenol 30 per cent, Camphor 60 per cent and Liquid Petrolatum 10 per cent form a preparation highly antiseptic yet devoid of topical irritation even to mucous membranes

Aromatized Sodium Perborate—The place of sodium perborate in dental practice is well established The pharmaceutical problem of presenting this substance in an attractive form is solved by slightly sweetening with saccharin and flavoring with a volatile oil A mint flavor is offered in the official formula

Solution of Procaine Hydrochloride—This solution contains 2 per cent of Procaine Hydrochloride in sterile normal salt solution *It can* also be prepared with a suitable Ringer's Solution

To each 10 cc of the Solution 0 1 cc to 0 2 cc (1 to 3 drops) Epinephrine Hydrochloride Solution is added just prior to injection

Astringent Tooth Powder—Add Copper Sulphate 2 to 3 per cent or Zinc Sulphate or Zinc Sulphocarbolate 1 to 2 per cent or Zinc Chloride 0 5 to 1 per cent

Abrasive Tooth Powder—Add Silex (XXX Flour) 25 to 50 per cent, or Pumice Flour 2 to 5 per cent

Alkaline Tooth Powder—Add Magnesium Oxide 20 to 40 per cent or Sodium Borate 10 to 20 per cent, or Sodium Bicarbonate 50 per cent

Oxidizing Tooth Powder—Add Sodium Perborate or Magnesium Peroxide 20 to 50 per cent

Dentifrice—The following basic formula for a dentifrice produces a safe cleansing agent

Soap, finely powdered	5 00%
Soluble Saccharin	0 25%
Oil of Peppermint	0 40%
Methyl Salicylate	0 80%
Precipitated Calcium Carbonate to make	100 00%

In turn it may be medicated according to the needs of the patient by incorporating the active medicament in suitable quantity

OFFICIAL SUBSTANCES AND PREPARATIONS EXTENSIVELY USED BY DENTISTS

Abrasives and Cleansers—Castile Soap U S P X Precipitated Chalk U S P X, Pumice Flour N F V Silex (XXX Flour)

Analgesics and Anodynes—Acetanilid U S P X, Acetylsalicylic Acid U S P X, Amidopyrine U S P X Chlorbutanol U S P XI, Fluidextract of Aconite N F V Oil of Clove *or Eugenol* U S P X Methyl Salicylate U S P X

Anesthetics (General and Local)—Chloroform U S P X Ether U S P X, Ethyl Aminobenzoate U S P X Ethyl Chloride U S P X Nitrous Oxide U S P X, Solution of Procaine Hydrochloride N F V

Antacids—Magnesium Oxide U S P X Magnesium Peroxide Sodium Borate U S P X

Antiseptics—Balsam of Peru U S P X, Boric Acid U S P X, Chlorothymol N F VI Iodine or Tincture of Iodine U S P X, Oil of Clove or Eugenol U S P X, Phenol U S P X, Sodium Perborate N F V, Thymol U S P X

Astringents, Styptics and Caustics—Alum U S P X, Arsenic Trioxide U S P X, Glycerite of Iodine and Zinc Iodide N F VI, Glycerite of Tannic Acid U S P X, Silver Nitrate U S P X, Solution of Zinc Phenolsulphonate N F V, Zinc Chloride U S P X Zinc Sulphate U S P X

Cardiac Depressors (Vaso-dilators)—Amyl Nitrite U S P X, Hypodermic Tablets of Nitroglycerin N F VI

Sedatives—Barbital Sodium U S P X, Chloral Hydrate U S P X Sodium Bromide U S P X

Stimulants (Cardiac and Cerebral)—Caffeine U S P X, Camphor U S P X, Hypodermic Tablets of Strychnine Sulphate N F VI, Solution of Epinephrine Hydrochloride U S P X

The sight of a thousand dentists industriously copying the formulas of the preparations exhibited was a pleasing one to the pharmacists serving at the display, for it proves that this phase of pharmaceutical activity has been neglected too long Appreciative comments proved that dentists are interested in this sort of thing and exhibits of official substances should be continued at dental association meetings and expanded in the future

The basic ideal of the entire display must not be overlooked, and this ideal as expressed in placards at the exhibit is to bring about "a closer coöperation between the dentist and his pharmacist"

DONATION OF DRUG JARS

James E Hancock has donated to the Museum of the American Institute of Pharmacy 22 glass drug jars which were owned by his father, the late John F Hancock, president of the AMERICAN PHARMACEUTICAL ASSOCIATION, in 1874

JOHN F HANCOCK

The bottles are 16 inches high and 7 inches in diameter, each container carries the coat of arms of a state, the design is a work of art in gold and pigment below it is the name of the drug which the jar contained and gives to the container its coloration, thus sulphur—yellow, indigo blue, etc These jars are rare and date back to the time when only twenty two states had been admitted to the Union, probably, nowhere is as complete a set and in such perfect condition as represented by this collection

The ASSOCIATION will also receive from the same donor copies of "Theophrastus" and of "Valerius Cordus," both in excellent condition

W F Thiede is the present owner of the John F Hancock Pharmacy at 1501 E Baltimore Street Baltimore few changes have been made in it, honoring the memory of his predecessor, who carried on his prescription practice in full view of the public, the furniture of this department is of walnut and in this as well as other sections of the pharmacy original ideas of the founder are in evidence

---

The American Institute of Pharmacy is dedicated to those who have given of their thought and endeavor to the preservation of Public Health and to the further advancement of Science in Pharmacy

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE A A C P EDITOR OF THIS DEPARTMENT

Editor's Note Some of us may think that the old days when we were compelled to teach incompatibilities for hours on end have gone and we need to give little or no attention to the subject to day With better basic training being given our students we would not have to give as much time to this subject as we used to give in the past However, we must not lose sight of the fact that new incompatibilities are arising every day because new drugs especially new synthetics, are being introduced Prof Mantz sets forth these problems in a clear and lucid way and offers a good suggestion on when and how the subject should be taught —C B JORDAN *Editor*

WHEN SHOULD THE COURSE IN INCOMPATIBILITIES BEGIN AND HOW SHOULD IT BE TAUGHT?

BY HARRY W MANTZ *

The methods used in teaching incompatibilities are, no doubt, similar in all schools of pharmacy Assuming this to be true, any useful methods carried out in one school can be applied advantageously by the others, and I present this paper with the hope that it will give rise to discussions from which we may all profit No matter how efficiently this subject may be taught, there will always be room for improvement

Incompatibility is one of the most difficult and most inadequately taught subjects in a pharmacy school curriculum and it is my thought that if a teacher is honest with himself, he cannot have a feeling of complete satisfaction after he has finished his discussions of the subject I am not criticizing the ability and knowledge of the teacher but refer to the difficulties inherent in the subject itself

Scientific, as well as commercial progress, leads to discoveries and the production of new compounds to be used for the cure of disease, which causes a continual increase in the scope of the subject This is further complicated by the fact that little is known about the composition of many of the so-called proprietary preparations, so frequently prescribed and this makes it difficult to explain many incompatibilities which may arise in combinations containing such products

In order to get a picture of the magnitude of the problem facing us, let us consider the number of prescriptions which could be written, by using one hundred drugs with "four to a prescription" The number of different combinations obtainable amount only to a little less than four millions Now, if we were to include all the medicinal substances known, the total would probably make the war debt figures, which we see in the daily newspapers, look like pin money This gives us an idea of the potential difficulties which may be dormant, but which may suddenly come into existence and face the man in the prescription laboratory Therefore, as teachers, we feel it our duty to train the students so that they will be able to cope with these problems when they arise

Referring more specifically to the subject of this paper, "When Should the Course in Incompatibilities Begin and How Should It Be Taught?" the syllabus allots 64 didactic hours and 128 laboratory hours to Dispensing Pharmacy and

* Temple University

suggests the teaching of incompatibilities as a part of the course While we understand the subject had to be put under some heading, we feel that this particular branch in the training of a pharmacist is of such vital importance that it cannot be adequately taught as a subdivision of Dispensing Pharmacy during the number of hours suggested Pharmacy as an art comes into being in the dispensing laboratory where the final technique is affected At this stage the student is on the verge of putting into practice, in his chosen profession, the knowledge which he has accumulated When this part of his training has been reached, he should have a knowledge of incompatibilities and be able to apply it

Instead of being incorporated as a part of a single subject, incompatibilities can be taught more effectively by dividing them into the three classifications and enlisting the cooperation of the chairs of Chemistry, Pharmacy and Pharmacology The teachers should have two objectives in view *first*, to teach so that the students will gain a fundamental knowledge of their subjects, and *second*, with the idea of training them to use such knowledge as it applies to incompatibilities We all realize that students generally lack the ability to apply what they have learned This teaching should begin as soon as the students have an understanding of the various subjects sufficient to enable them to comprehend the meaning and importance of incompatibilities as they pertain to medicinal substances

The teaching of chemical incompatibilities can have its origin in General Chemistry under the discussions of ionization, and be continued throughout the various succeeding courses in Chemistry In the laboratories prescriptions can be used to illustrate the reactions For example, in giving the test for chlorides, a prescription containing silver nitrate and physiological salt solution could be used to make the student aware of the incompatibility which exists in such a combination

Discussions on pharmaceutical or physical incompatibilities can be included with those of the simplest preparations such as the aromatic waters In the laboratory the student can compound a prescription calling for a bromide to be dissolved in an aromatic water and note what occurs, and then be instructed how to remedy this difficulty In like manner, the student could be gradually trained to handle the more difficult combinations

The pharmacist is not greatly concerned with therapeutic incompatibilities, but the departments of Pharmacology and Toxicology could do their share of the work by referring to the poisonous combinations which may result from chemical changes or unforseen physical incompatibilities

By following these plans the teachers in the laboratories have the opportunity of applying one of the basic principles of learning, "Learn by Doing," and we all agree with the old saying, "Experience is the best teacher " This is really how our veteran forefathers in pharmacy learned their profession, they learned by doing Due to the change of conditions in the profession of pharmacy and to the gradual decrease of practical experience required by the State Boards, the burden now rests upon the shoulders of the institutions and their faculties They are expected to supply ways and means for this training

These are the methods the School of Pharmacy of Temple University uses to teach incompatibilities before the student enters the course in Dispensing Pharmacy

Allow me to explain briefly how we teach that part of Dispensing Pharmacy which applies to incompatibilities and the compounding of prescriptions At this point we know that the student has had instruction pertaining to incompatibilities both in lectures and in laboratories The Dispensing Pharmacy Laboratory, as has been stated, is the finishing department and the work outlined here for the students, as far as this subject is concerned, consists chiefly of an application of the knowledge already gained

We have on file the names of approximately one hundred practicing physicians from whom we solicit prescriptions which they use frequently and we request them to mark those which they have found by experience to have been the most difficult to have compounded satisfactorily This list not only includes physicians in the vicinity of Philadelphia, but those located in different sections of Pennsylvania and a few other states Many names and addresses of physicians are obtained from the students themselves

The prescriptions are placed on cardboards which are inserted into a folder with a leather back and transparent front, and each student is required to copy the prescriptions in a note-book A certain amount of time is set aside during each laboratory period for this work After each student has copied about two hundred prescriptions, he is assigned four on which he writes a detailed description as to the methods of preparation of the ingredients, the methods of compounding and a discussion of any difficulties which might possibly arise This procedure makes it necessary in many cases for the student to refer to the library At the end of the time allotted, each student reads his assignment in class The instructor then answers questions, makes corrections or further discusses the prescriptions, as necessary In this manner each student contributes to and benefits by the research work of the others Many of these prescriptions are compounded during the laboratory hours It is interesting to know that in many cases those students who are working in drug stores compound the prescriptions assigned to them for their own benefit, if they have not been already compounded in the dispensing laboratory In other cases exceptional prescriptions are compounded by the instructor to demonstrate the reactions

Our curriculum contains special hours assigned to the general discussion of difficult prescriptions received in drug stores where our students are employed The students also are urged to make memoranda of any interesting problems which only present themselves in a drug store During this period a representative from each of the departments of Chemistry, Pharmacy and Pharmacology is present to discuss questions which are pertinent to his teaching

By using this system we feel that the student is getting experience which is analogous to that obtained in a drug store He comes in contact with prescriptions which are being used rather frequently, and due to the number of physicians who submit them, he gains valuable experience in reading a variety of handwritings

With the trend of modern medicine toward the use of specifics in the treatment of disease, these problems may not confront the pharmacist in the future as frequently as they have in the past For the present, however, as teachers, we should feel it our responsibility to give the student training which is as practical and comprehensive as possible

To summarize, my thought is that

1 Teaching incompatibilities should begin soon after the student enters the school

2 All teachers should have this subject constantly in mind and select illustrations for their statements from the incompatible group whenever possible

3 This accumulation of theory under the various chairs should then be applied in the course of dispensing pharmacy

4 Better results will be obtained from the use of original prescriptions than from the use of printed formulas

5 The conference on prescription difficulties occurring in the stores from day to day, keeps the instruction up to the minute

---

THE TEACHING OF INCOMPATIBILITIES

BY W G CROCKETT *

Editor's Note The preceding paper by Professor Mantz, together with the four papers following comprise a good symposium on Incompatibilities It is noticeable that the authors are not in entire agreement on when and how this subject should be taught and this to me, is a good sign When we all agree on a time or a method of teaching a subject, we should ask ourselves whether we have not eliminated originality, the teacher s best qualification Two teachers may present a subject in quite a different way and yet secure equally good results I do not agree with some of the authors on when and how incompatibilities should be taught and more than likely the reader would not agree with me should I set forth my opinions What are we to do in this dilemma? Read all the papers those of Mantz Crockett, Johnson, Mitchell and Terry, and cull the best from each of them —C B JORDAN, *Editor*

The subject of incompatibilites in prescriptions is an important one, and one which should not be treated superficially by educators merely because physicians in recent years have become more and more inclined toward prescribing simple-named, manufactured products Evidences of closer cooperation between medical and pharmaceutical groups throughout the country, along with increasing costs of medical care, lead me to believe that as the years go by physicians will return to writing original prescriptions in order to reduce the costs of medical care and at the same time forestall self-medication on the part of the laity If this be true the subject of incompatibilities in prescriptions will be of more concern in years to come than it is at the present time We must teach for future needs as well as for present ones

A complete discussion of the teaching of incompatibilities should embrace both what to teach and how to teach it This subject is so broad and so debatable that I shall not attempt to treat either of these phases in detail, but instead will confine myself to a few thoughts or principles with the expectation that the discussion which follows will bring us many different points of view and thereby be more helpful than my own personal views Any scheme I might present would prove inadequate even to myself I say this because I find myself altering my own approach to the subject from year to year

At the outset I wish to state that I think it a mistake to isolate the subject of incompatibilities and attempt to teach it as a separate course Curricular

* Medical College of Virginia

conditions in the three-year course necessitated my attempting it in this way I found that the students regarded it as a separate entity and failed to associate it properly with dispensing pharmacy I think the didactic and laboratory courses in dispensing pharmacy should treat first of the fundamentals of prescription compounding with emphasis upon technique and the many minor but important details The subject of incompatibilities should develop out of this course, as a part of the course in dispensing pharmacy The discussion of prescriptions in both didactic and laboratory courses should be complete If the subject of incompatibilities is segregated and taught as a separate course under a distinctive title the student is inclined to magnify the importance of the incompatibility, and in his discussion neglect such vital points as the method of compounding, accessory labels and the kind of container in which the prescription should be dispensed

I think a review of the pertinent parts of qualitative analysis is highly advisable I can go further and give you an outline of the method which I followed last year I distributed sets of mimeographed sheets to the students, bearing the more important incompatibilities of the common inorganic and organic compounds I made assignments on these sheets and at the following didactic period distributed prescriptions which set forth incompatibilities mentioned in the assignments These the students discussed both orally and in writing Afterward they compounded some of them in the laboratory

After the sheets had been disposed of, I distributed at each didactic period copies of prescriptions representing incompatibilities in general The students were required to discuss them fully, both orally and in writing, during that particular period Results were gratifying I have been unable to get satisfactory results in prescription discussion by making assignments in a book which points out the incompatibilities, their remedies and methods for compounding Conferences with students after graduation have confirmed my belief that this is poor practice, as it tempts students to memorize rather than think

It is of course understood that teaching problems differ in different institutions In writing this paper I have been influenced undoubtedly by conditions in the institution which I represent A brief explanation may be in order The Medical College of Virginia operates two dispensing pharmacies to take care of the needs of its out-patient department and three hospitals The medical staff rotates, thereby bringing approximately 150 physicians onto the staff during the year Practically all the prescriptions written by these physicains are for official and extemporaneous mixtures The ordering of medicines by stock numbers is not permitted All prescriptions are written just as if they were to be presented at a retail store

Approximately 150 prescriptions are filled daily in these two pharmacies Routine prescriptions which do not constitute experience for students after they have filled them two or three times, are segregated and filled by the full-time hospital pharmacists The others are filled by senior pharmacy students, under close supervision In the past each senior student has served fifteen hours a week for approximately ten weeks in these dispensing pharmacies Now that classes are smaller their periods of service will be lengthened These facilities have enabled us to give much instructional work in incompatibilities in these pharmacies, as

each student is quizzed on each prescription he fills as soon as it is completed This course is supplemented by a laboratory course in prescription compounding, in which types of incompatibilities which do not occur frequently in our dispensing pharmacies, are treated

These articles will be continued in the May number of the Journal

THE NATIONAL CONFERENCE ON PHARMACEUTICAL RESEARCH

BY JOHN C KRANTZ, JR , SECRETARY

The National Conference on Pharmaceutical Research has sent out its official notices convoking the Thirteenth Annual Meeting This meeting is to be held in conjunction with the AMERICAN PHARMACEUTICAL ASSOCIATION at the Hotel Shoreham, Saturday, May 5th, at 2 00 P M

During the thirteen years of its existence the National Conference on Pharmaceutical Research has served as a clearing house for research in pharmacy and its cognate sciences in the United States It has annually compiled a Census of Pharmaceutical Research which has been most useful in determining the increment of progress of research in pharmacy during the year Besides, this census serves as a stimulus to research workers in the field In addition, under the auspices of the Conference, the Symposium "Fighting Disease with Drugs" was published for the purpose of telling the story of pharmacy in a more or less popular style

For the past two years the Conference has awarded annually a fellowship of five hundred dollars to graduate students in universities pursuing courses for the doctorate degree, whose research was of a pharmaceutical nature

During the coming year the Conference will endeavor to compile the reports of the various committees, written in a simple, narrative form, in a volume indicated as The Annual Survey of Pharmaceutical Research It is our hope that this new publication will adequately tell the story of the advance in pharmacy each year and like the Census of Research serve as a stimulus to workers in the field

The Conference anticipates a successful meeting in Washington, and takes this opportunity to invite those interested in the various ramifications of pharmaceutical research to attend its sessions and to participate in its deliberations

RESEARCHES AT THE MELLON INSTITUTE

Among the results of the investigations it has been determined that no systemic pharmacological effects can be ascribed directly to absorbed aluminum, it does not appear to be cumulative in the tissues No harmful effects were shown from soluble aluminum occurring naturally in foods or from utensils

Recent investigations which are being carried on with the coöperation of Mellon Institute have indicated probable valuable application of sodium metaphosphate in the field of veterinarian medicine One of its uses is for preparing solutions for washing and rinsing dogs and other furred animals

WASHINGTON BOTANIC GARDENS

Development of the old site of the Botanic Gardens into Union Square and the proposed transfer of the new Botanic Gardens from jurisdiction of the Joint Committee on the Library of Congress to the Department of Agriculture recall the origin and development of this old institution, which has been in existence for more than a century

The establishment of a botanic garden was the subject of correspondence between Washington and District of Columbia officials It was in 1820, after years of discussion, that the Columbian Institute for Promotion of Arts and Sciences obtained passage of a bill in Congress which became a law on May 8th

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council" —Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association"

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues-paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates"

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

BALTIMORE

The regular monthly meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson on Tuesday, February 27, 1934

President Cole opened the meeting and the usual business was deferred The meeting was turned over to Mr John A Strevig, of Eli Lilly and Company who presented a sound film entitled, The Production and Clinical Application of Insulin'

The picture portrayed the various steps in the production of insulin on a huge scale, the numerous control procedures involved and the final standardization of the product The second portion of the film was devoted to the application of insulin in the treatment of the diabetic in the clinic One of the most interesting exhibits presented was a young man who has received as many as ten thousand injections of insulin in the past ten years without infection from the injections A truly remarkable record for a remarkable drug

At the conclusion of the presentation a rising vote of thanks was extended to Mr Strevig and the company which he represents About seventy five attended the meeting

MARCH MEETING

The Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was host to the members of the Boards of Pharmacy and the Faculties of the Colleges of Pharmacy in District No 2 at their March meeting

The evening was devoted to a dinner given in honor of the visiting members of these associations The dinner held at the Emerson Hotel, was an unusually delightful affair The speaker of the evening was Dr Huntington Williams Commissioner of Health of Baltimore City, who had for his topic, 'Relation of Pharmacy to Public Health" Many notable personages in pharmacy and medicine were present After the conclusion of Dr Williams' address President Cole called upon many of the deans of the Colleges of Pharmacy and others for a few remarks which were rendered in a humorous manner with due attention to the more serious nature of the meeting

Approximately fifty guests attended the dinner meeting and also a number of the local members of the Baltimore Branch A PH A The address by Dr Huntington Williams follows

RELATIONSHIPS BETWEEN PHARMACY AND PUBLIC HEALTH *

BY HUNTINGTON WILLIAMS M D, DR P H

Medicine and Pharmacy are sister sciences which have traveled hand in hand down the centuries from prehistoric times and ever since self preservation has been instinctive in the human

* Address delivered before the Boards of Pharmacy and the Faculties of the Colleges of Pharmacy in District No 2 Baltimore Maryland March 12, 1934

race Preventive medicine has an equally long heritage, but only recently has it emerged as a full fledged specialty in the medical family, with new scientific bases and techniques of its own The aims of medicine and pharmacy have always been the same, namely, the protection or restoration of health Of late, however, there has been established a new focus of attention, the *keep well* rather than the get well point of view And now in 1934 we find ourselves five years along in a new era, faced with new problems resulting from a world apparently out of gear—a topsy turvey world created, it seems, from the golden prizes which human greed and selfishness have ever held just out of reach If ever there was a time when teachers were needed to set an example and stress the return to the old fashioned ideals of unselfish service, it is now With this thought in mind, I would direct your attention for a few moments to some of the mutual relationships between public health and pharmacy

The goal which modern medicine is gradually setting for itself, which indeed the intelligent modern layman is demanding of it, is a *keep well* service, which from the prenatal period to the grave seeks to prevent needless sickness and suffering and to postpone the arrival of the grim reaper just as long as possible Whereas the old style public health was largely a restrictive or *police* type of service, based on inadequate scientific knowledge, the modern health movement is almost entirely *educational* in its viewpoint The health officer of to day tries to teach his people the thousand important ways of keeping well

It would seem that in pharmacy, too, the National Association of Boards of pharmacy has recognized the need for spreading the newer information and has established a Department of Education which issues a special Bulletin When the health officer looks about him he sees at once that he is faced with a mammoth task—to achieve success it is imperative that the teaching of the essentials of keeping well must be integrated into all the educational processes going on about him Their range is rather staggering This evening I would emphasize one of the special educational fields in which adequate public health instruction is essential and in which a closer liaison may perhaps be built up between pharmacy and public health

This special field is that of higher or professional education, the field which, for our purposes includes the medical schools, and the schools of nursing, dentistry and pharmacy In this field the opportunities have never been greater nor the responsibilities more definite for placing in proper focus in the curriculum the attention which should be paid to instruction in public health and the modern aspects of preventive medicine

To day the graduates in all these special groups are expected to practice their professions along preventive lines To do this each group must know much of the principles of the modern public health movement, which is so wide in its scope as to embrace the preventive aspects of all the special fields The curricula of these professional schools are rapidly expanding to include the *keep well* viewpoint The tremendous need for this in schools of pharmacy is clearly expressed in the following statement taken from the introduction to a volume known to most of you here to night, The Basic Material for a Pharmaceutical Curriculum "

' Conspicuous among the duties of the pharmacist is the group which deals with public health These activities constitute his major function in connection with social and community life Filling prescriptions correctly is, of course important to the public as is also the display and sale of reliable products, but in the service to public health the pharmacist serves the community in a unique way Naturally, there are many sources from which the public may secure accurate health information—the public schools, the newspapers, and the publications of federal, state and private agencies These all contribute their part to the solution of health problems, but the information they provide is general, and must be made specific in order to meet the personal needs of the one who is confronted with specific troubles of his own To give this personal assistance the doctor is at hand But many people are afraid of physicians and hospitals More over, the physician keeps office hours which are relatively inconvenient for people who are busy with their own affairs In addition to this, charges for consultation and treatment, even though modest often keep the public from seeking the advice of a physician

"The pharmacists are therefore more strategically situated than any other group of individuals to give personal advice upon matters of public health on which they are informed The information is given free of charge and can be secured within easy walking distance of the home The materials necessary for controlling the health problem are in stock and can be obtained promptly Queries about health facts are casually asked by interested customers Odds and

ends of information not easily accessible in the health literature can be gained in such conversations with a pharmacist A well-informed pharmacist is the best single individual to disseminate information about public health "

Certainly if this be true a tremendous responsibility rests upon those persons who are charged with the training and licensure of future pharmacists and the post-graduate instruction, such as there may be, of those now in the field You who are the ones to shoulder such a burden in this portion of the country should find the health officers and their colleagues in the medical profession more than willing to ally themselves with you in a common purpose

What are some of the practical ways in which the graduate in pharmacy may best fit himself into the public health machinery of his own community? First of all, I feel that the man in charge of a corner drug store would want to select from his acquaintance some particular physician in whom he has great confidence and to whom he would feel free to turn for suggestions and guidance in the many problems of his daily work that may have a direct bearing on the practice of medicine, both curative and preventive Then, I believe the pharmacist would wish to establish a personal relationship between himself and some representative of the local health department or board of health in his community so that by informal telephone communication he would, at any time be able to secure the point of view of the official health authorities on a multitude of problems closely connected with his own work

What are some of these special public health problems which day after day confront the man behind the counter? Among the very first should probably be mentioned the matter of the venereal diseases which probably is the biggest and most difficult of all public health problems Here again the volume on basic curriculum material in pharmacy includes the following wise statement

' The venereal diseases annually exact an enormous toll of health, happiness and efficiency The very great frequency with which pharmacists are consulted with respect to the treatment of these diseases places them in a special class from the standpoint of a student of pharmacy Probably there is no public health problem in the solution of which the coöperation of the pharmacist is so desirable as the education of the public with regard to the dangers of these diseases and the importance of observing the laws and ordinances promulgated for their control "

The prevalence of the venereal diseases in our community was recently studied in a careful manner by the United States Public Health Service, with the resultant estimate of approximately 10,000 fresh cases of venereal diseases in this city each year and an approximate total of 10,000 cases constantly under treatment in this city Health officials are still baffled in many communities by what amounts to a conspiracy of silence in connection with this problem and by a great public apathy in regard to it Gradually, but by very slow educational methods, we are striving to reach a more open-minded public approach to this great question In the meantime we know of the tremendous temptations which beset the pharmacist for ' over the counter ' diagnosis and treatment by the promiscuous sale of remedies of doubtful value The man behind the counter, of course, should do his best in determining whether his client can afford a family physician and in obvious cases where this is economically impossible, the pharmacist should know of the nearest health department venereal disease clinic or hospital dispensary and refer his customer to it

In the matter of tuberculosis we are faced with somewhat the same problem The patent medicine and the cough mixture are easy to dispense, but the pharmacist who takes his responsibility seriously will worry considerably as to whether the cough or cold has been of long duration and again should know of some tuberculosis clinic or dispensary in case his client is apparently an indigent It was not many months ago that I stopped at a corner drug store one evening and witnessed a young assistant in charge, scarcely more than twenty years old, who took from the shelves what was apparently a patent preparation for a customer who said he had a pretty bad cough Just which of a large variety of commercial products was to be selected was determined by the remark of the young fellow behind the counter that he knew this particular brand was said to be useful in "lubricating the bronchial tubes " This settled all questions in the mind of the purchaser who went away satisfied, although I left with a feeling that the bronchial tubes were not just like a set of piston rings, in need of lubrication

The pharmacist comes close to the public health program in the matter of the handling and distribution of many biologic products, such as sera, antitoxins and vaccines For ten years it was my official duty to make periodic inspections of public health laboratory supply stations,

established in drug stores, and I was constantly amazed at the indifference with which some very perishable biologic products were stored in an ice box, it would seem merely for the sake of appearances and quite regularly without the use of ice It certainly must be true that many young children are vaccinated time and time again without success, because the vaccine virus has not been kept on ice either at the pharmacy or in the physician's office

Of course the public will ask at the drug store for all types of information on personal hygiene including the prevention of such diseases as diphtheria and typhoid fever I see no reason why an up to date pharmacy should not have a rack accessible to all its customers which might be filled with a carefully selected set of leaflets and pamphlets issued by the recognized health authorities and prepared for free public distribution as high grade educational material on these and many other problems of personal and community health Again the customer will ask for the latest information in regard to nutritional problems, which brings up the whole matter of an apparent present day tendency to overadvertise the vitamins In this field I have a strong feeling that the whole vitamin business has been so thoroughly and unjustifiably commercialized with the misleading advertising which is so rampant in our day that modern scientific developments are often asked to bear premature and excessive burdens This same feeling would apply in like manner to a host of other problems which face the pharmacist in his daily work and which we trust may, in some manner be improved by the enactment of a new federal food and drug bill

The pharmacist is called upon at any hour to render first aid and of course must always have a knowledge of toxicology which often has an important bearing on preventive medicine and public health So, too, he must have a knowledge of the essentials of maternal and child hygiene as well as a general understanding of the practical problems of community sanitation, including the purity of public water supplies and of milk and food supplies

It would be a needless task for me to attempt to bring before you any complete review of the endless inter relationships between the work of pharmacy and public health You will agree I feel sure, that to instil into the pharmacist a desire for a thorough knowledge of the modern public health campaign is really about all that is necessary If he does not lose this desire, he will continue to keep up to date and be a most valuable member in the great army of public health workers in his community There can be no doubt that in this matter all of us have a great and common task which is largely educational in nature Concerning it, I for one, am filled with optimism for the future

The lessons of the last five years have been hard, but necessary ones The period since 1929 has been one of a great awakening—and came at the end of a decade when all classes were worshiping the golden calf The house of cards has pretty well fallen and with the depression may come a return of common sense, and a desire to understand and coöperate for the public good Evidences of such a tendency may already be seen in the proposed changes in the national food and drug bill, which will be supported by the sister sciences of pharmacy and public health As Dr Robert Swain has pointed out—legislation in pharmacy as in other fields should be based on sound public interest and not on selfish motives It is not too much to hope for a clearer focus on spiritual values in our every-day work where much will depend on the honor and integrity of the individual We may be well-content to follow the way of life of perhaps the greatest modern physician, William Osler He did his day's work as best he knew how and was willing to leave to destiny the outcome of his labors

CHICAGO

The monthly meeting of the Chicago Branch was held on March 20 1934 at the University of Illinois College of Medicine

A Symposium on Hospital Pharmacies" was presented by the following active members of the Branch Wm Gray of the Presbyterian Hospital I A Becker of the Michael Reese Hospital, S W Morrison of the University of Illinois Research Hospital

The discussions brought out the many differences between the hospital pharmacies and the retail drug stores The number of prescriptions filled calls for the purchasing of drugs in large quantities A comparison of the relative value of a drug as compared to another similar acting drug of less cost must be made as the hospital expense for drugs can be materially lowered where such large amounts are used

Definite systems in the filling of the prescriptions are used to promote efficiency accuracy and time saving

Mr Becker mentioned that powders and capsules are not prescribed at the Michael Reese Hospital as much time can be saved by dispensing the same medicaments in liquid form Large quantities of the fast-moving medicaments are prepared in the form of 100%, 50% and 25% solutions

Mr Gray mentioned the interesting point that at the Presbyterian Hospital a committee exists the pharmacist being an important member of this committee, that meets and discusses the new preparations placed on the market as to merit and price In all cases official and non secret medicaments are used where possible

Mr Morrison, in the course of his discussion presented a comparison of the prices of manufactured products to those made by the hospital pharmacists The resulting figures should be an incentive to all pharmacists to manufacture more of his official preparations

Exceptions were cited where it is practically impossible for a pharmacist to manufacture some preparations, and would be cheaper also to purchase from the large manufacturing concerns

After a five-minute recess the meeting was again called to order and Mr Morrison presented a series of incompatibilities that he had encountered at the hospital Methods of overcoming these were shown and discussed

LAWRENCE TEMPLETON *Secretary*

DETROIT

The February meeting of the Detroit Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at Webster Hall, February 22nd A special Washington Birthday dinner preceded the meeting and a large gathering turned out to hear Director Parr which was augmented by the attendance of the members of the Board of Pharmacy

Owing to the absence of President Felix Johnson, the meeting was called to order by Treasurer Fred Ingram He introduced the University of Michigan alumni, including Clarence Weaver, Leonard A Seltzer, Glenn Staines, N M Henry and Prof C C Glover and Norman A Weess of Everett and V C Piaskowski, new members of the Board of Pharmacy

The Colleges of Pharmacy were represented by Dean R T Lakey of Wayne University, Prof R. L Donon of Detroit Institute of Technology, and Dr Howard B Lewis of the University of Michigan Dr Lewis confirmed his previous invitation to hold the May meeting of the Detroit Branch, in conjunction with the Pharmaceutical Conference of the College of Pharmacy of the University of Michigan on May 17, 1934

S R Klegon represented the clerks Mr Ingram then introduced the speaker of the evening, another University of Michigan Alumnus Director of Drugs and Drug Stores, E J Parr

The director presented a very interesting picture of the many problems confronting pharmacy in Michigan He said the retail druggist must have protection against outside interests that are making strong inroads on the legitimate drug business He referred to the vendors particularly and the patent medicine stores During the last thirty days 125 vendors were licensed by the State and 15 convictions obtained for vending without a license

The Michigan Clinical Thermometer Law was referred to by Director Parr as needing amendment He claimed Connecticut, Massachusetts and New York alone had satisfactory thermometer legislation

Mr Parr predicted the grading of drug stores in the near future into three classes—the professional semi professional and merchandising stores He said standards must be set up for qualification and inspection to include equipment scales, weights and pharmaceuticals carried in stock The Board of Pharmacy can only do what the laws allow, therefore, the answer is with the pharmacist, the Board is empowered to make rulings but not laws

The listeners were astounded to learn that about one thousand manufacturers of medicinal preparations by non pharmacists were established in kitchens, barns, etc, in Michigan over which the Board has practically no control A $20 license is required for every dog remedy, veterinary medicines are controlled by the State but no such control is exercised over medicines for humans He pointed out that the drug laws in Michigan were very indefinite and offer very little protection to the druggist and even less to the public health Improvement of the pharmacy laws which are unjust to the future generation was urged The Board of Pharmacy desires to have qualified pharmacists, within the last month three drug store licenses were revoked for not operating according to the law The Board at all times must consider the public health

The pharmacists were informed that on July 1, 1934, new numbers were to be issued to drug stores in order to give an accurate check on the number of stores operating in Michigan At present 5500 licenses have been issued with less than one half of that number active

A general discussion followed, led by Dean R T Lakey

On motion of Prof C C Glover, a rising vote of thanks was given to Director Parr for his enlightening and interesting talk, which brought a most profitable and pleasant evening to a close

BERNARD A BIALK, *Secretary*

UNIVERSITY OF FLORIDA STUDENT BRANCH

The March meeting of the University of Florida Student Branch was called to order at 5 10 P M , March 21st, by President Jones

A discussion of the action to be taken by the Local Branch on a design for appropriate insignia was participated in by members Coniglio, McLean and Johnson The matter was deferred until such time as all other Student branches had answered requests for opinions

There being no further business, President Jones called for nominations for officers for the coming year The following were nominated

For *President*, Frank L Coniglio

For *Vice President*, Arthur Goldstein, Robert L White

For *Secretary*, Richard S Johnson

For *Treasurer*, Paul Fehder, Dale Roth

On voting (by secret ballot) Messrs White and Fehder were elected to the offices of *Vice President* and *Treasurer*, respectively There being only one nomination for each of the other offices the secretary was instructed to cast a ballot for Messrs Coniglio and Johnson for the offices of *President* and *Secretary*

After appropriate remarks by retiring President Jones and President-Elect Coniglio the meeting was adjourned FRANK S CONIGLIO *Secretary*

NEW YORK

The March meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on March 12th, in the College of Pharmacy, Columbia University About one hundred members and their guests attended

President Ballard was in charge of the meeting After the meeting was called to order, the report of the secretary was read and accepted

Chairman Kassner, of the Professional Relations Committee then announced the Physicians and Pharmacists' Meeting to be held on March 29th in the Academy of Medicine under the auspices of the Academy of Pharmacy Every one present was urged to attend

Chairman Dauer of the Committee on the Progress of Pharmacy then reported on the following new remedies

Mercupurin—an organic compound of a mercurial salt and theophylline It is used in cardiac edema, cardiorenal edema and for cirrhosis of the liver It is a powerful diuretic.

Pentnucleotide—a mixture of the sodium salts of pentose nucleotides It is used in cases of agranulocytic angina

Novatropin—methylhomatropine bromide Its paralytic action is comparable to that of atropine and it is eight to ten times as potent as homatropine However, it is less than one thirtieth as toxic as atropine

President Ballard presented the guest speaker for the evening, Dr Ernst Boas, who discussed "The Heart and Its Diseases"

Dr Boas began by giving some very interesting statistics on heart diseases He showed that the death rate from heart diseases was gradually mounting, but that in some age classes decreases were to be noted However, improved methods for diagnosis made comparison of recent figures with old rather unreliable, for, not many years ago, heart disease diagnosis had not reached a point comparable with methods employed to day

Having briefly reviewed the mortality statistics Dr Boas went on to discuss the causes of heart diseases These he grouped into four classes

1 Rheumatism
2 Syphilis
3 High blood pressure
4 Arterio sclerosis

The latter two go hand in hand, making really but three causes After emphasizing that methods for preventing heart diseases were unknown, Dr Boas went on to discuss progress made in controlling the diseases which lead to heart afflictions For younger persons, rheumatic fever, is a primary cause of heart disease By reducing the prevalence of this disease some progress in conquering heart disease has been made

The speaker went further to explain that a definite type or kind of heart disease develops from rheumatic fever, and that every fresh attack of the disease causes new heart damage

About five to ten per cent of the adult cases of heart disease can be traced to syphilis This disease can now be controlled and hence, heart disease from this cause can be controlled However, heart damage usually has already taken place by the time a diagnosis is made The heart damage is usually upon the valves of the aorta

High blood pressure is important as a cause of heart disease It generally runs in families, and is probably due to some disturbance in the flow of internal secretions The heart must work harder under such circumstances and it gradually enlarges and weakens This usually requires many years and heart failure finally results

Arterio sclerosis is a sign of senility It usually occurs in persons after forty It may bring on apoplexy, or the kidneys may fail Arterio sclerosis picks out the vital organs for its attack

Dr Boas then showed numerous slides which illustrated many points covered in his talk thus far He also showed some extremely interesting graphs made with an electrocardiogram and explained fully what use the specialist made of this information to aid him in his diagnosis

In his concluding remarks the speaker made clear that there are heart diseases, specific afflictions of the heart, and that a single expression to describe all of these was misleading He again pointed out the diseases which precede heart diseases and discussed their control as far as possible In treating heart diseases many new remedies are being tried Digitalis is, of course, a standard But quinidine is being used in some types with marked success Many mercurial organics are being used for their diuretic properties, and large doses of urea and ammonium chloride are also used for the purpose

Finally, Dr Boas repeated that we do not know how to prevent heart diseases but that this subject was receiving very considerable attention and much study was under way

After answering several questions a rising vote of thanks was accorded Dr Boas for his highly informative discussion

RUDOLF O HAUCK, *Secretary*

NORTHERN NEW JERSEY BRANCH

The March meeting of the Northern New Jersey Branch was convened at the Rutgers University College of Pharmacy on March 19th, by President Little

Plans for the April meeting at which time we will have the pleasure of entertaining the physicians of this neighborhood, were discussed Professor Schicks in detailing the arrangements for the evening explained that the only ticket of admission required of the pharmacists who attend will be that they are accompanied by one or more medical friends

The program is to be made up mostly of demonstrations illustrating the compounding of type prescriptions, the use of new apparatus in prescription work, and the manufacturing of galenical preparations The Rutgers University College of Pharmacy is turning over its laboratory facilities and staff for this work

In addition to the practical laboratory demonstrations, the Hudson County and Elizabeth Pharmaceutical Associations will have exhibits which display the work of the prescription room to excellent advantage Parke Davis and Company and Eli Lilly Company are also coöperating with displays of glandular products

The Nominating Committee reported the names of the following candidates for officers of the Branch for the ensuing year *Honorary President*, Philemon E Hommell, *President*,

Ernest Little, *Vice-President*, G C Schicks, *Secretary*, L W Rising, and *Treasurer*, A F Marquier The candidates were elected by unanimous ballot

Professor O P M Canis gave a short talk on the rapid return of Pharmacy to botanical materia medica He felt that the trend was very definitely in that direction and in order to profit by it pharmacists should begin an intensive study of the U S P and N F herbs Drawing many illustrations from his forty-five years' experience as a retail pharmacist he vividly portrayed the potentialities of this swing in prescription writing

To complete our evening of professional discussions Professor C L Cox presented a talk on emulsions The theoretical considerations were nicely balanced with the practical manufacturing problems arising both in the making of emulsions, and the preventing of their formation at times when their presence would disrupt certain processes By means of laboratory demonstrations made while he talked Professor Cox forcibly illustrated many oddities in emulsion making, and the use of different types of equipment

L W Rising *Secretary*

NORTHERN OHIO

A joint meeting of the Northern Ohio Branch of the American Pharmaceutical Association and the Western Reserve University Student Branch, A Ph A, was held in the Faculty Club of Western Reserve University, Cleveland, Ohio, April 13, 1934 The meeting was under the auspices of the Student Branch and was preceded by a dinner, the guest of honor being Secretary M N Ford of the Ohio State Board of Pharmacy and secretary-treasurer of the Conference of Pharmaceutical Law Enforcement Officials

After the dinner, the meeting adjourned to the class room auditorium of the School of Pharmacy where the membership and others interested in Pharmacy listened to a very much worth-while and interesting talk on Mr Ford's experiences, covering a period of more then twenty years, as secretary of the Ohio Board of Pharmacy and as an enforcement officer of Pharmacy laws

Some Court decisions were reviewed and some episodes touched upon in order to demonstrate the fact that the path of a law enforcement official in fields of professional practice is not a rosy one However, it was pointed out, there seems to be a gradual improvement all along the line in Ohio and other states of the nation due, largely, to the concerted efforts of the members of the Pharmaceutical Law Enforcement Conference

Mr Ford congratulated the Student Branch on its manifested interest in better pharmacy and assured the members that the future of professional pharmacy and its ethical practice will be influenced in no small degree by groups similar to those that composed this joint meeting

Just previous to the dinner meeting the Council of the Northern Ohio Branch, A Ph A, in addition to some routine business matters adopted the following resolution

RESOLUTION ON THE DEATH OF HERBERT E BENFIELD

Whereas, Our highly respected and much beloved co worker, Herbert E Benfield passed away on February 26, 1934, and

Whereas, Mr Benfield was one of the founders of this organization and held its ideals and purposes in the highest esteem, and,

Whereas, His exemplary service as president and committeeman, along with his regular attendance when not in office amply demonstrated his willingness to make more than lip contributions and,

Whereas, His exceptional friendliness and genial fellowship his kindliness and toleration won the admiration and endearment of all his associates

Resolved, that we express our deep sorrow at his death and extend to his widow and relatives our heartfelt sympathy in their hour of bereavement

Resolved, that a copy of this resolution be sent to Mrs Benfield, be entered in our minutes and be sent to the Editor of the Journal of the American Pharmaceutical Association

N T Chamberlin, *Secretary*

PHILADELPHIA

The March meeting of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in the auditorium of the Philadelphia College of Pharmacy and Science, on Tuesday evening, March 20th

The occasion was that of the annual dinner tendered by the members of the branch to its past-presidents in honor of their loyalty to the organization

The following past-presidents attended and each was called upon by President Eby for a word of greeting and a few appropriate remarks W A Pearson, E Fullerton Cook, Ambrose Hunsberger, W W McNeary Brua C Goodhart, Raymond Hendrickson Adley B Nichols James C Munch and William J Stoneback Although topics were not assigned these speakers the general trend of their discussion concerned the necessity for advancing the pharmaceutical profession with an outlook toward its future Favorable legislation to abolish unsatisfactory conditions, cooperation with other similar professions, the need for a social survey for pharmacy and for increased pharmaceutical research were among the suggestions offered by the various past presidents

An illustrated talk on The Appreciation of Art" by Mr V McCormick was then enjoyably received by the group

Near the close of the meeting the annual reports of the secretary and treasurer were read and approved, and the chairman of the Nominating Committee presented a list of officers for the coming year The following were unanimously chosen

President, Alfred Barol
First Vice President, Theo A Campbell, Jr
Second Vice-President L L Miller
Secretary-Treasurer, Edmund H MacLaughlin

President Eby thanked the members assembled for their coöperation during his term of office and after installation of the new officers the meeting was adjourned

EDMUND H MACLAUGHLIN, *Secretary*

NORTHWEST PHARMACEUTICAL BUREAU ELECTS OFFICERS

The following officers were elected *President* J P Jelinek, St Paul *Vice Presidents* J J Gillespie, Des Moines and John Heerema, Pella, Iowa, *Treasurer*, Robert M Gibson Des Moines Iowa, *Secretary* Rowland Jones Gettysburg, South Dakota, *Advisory Secretary*, Frank M McCabe, St Paul *Executive Committee* N Vere Sanders, Albert Lea Minnesota P J Jepson, Newton, Iowa John Veenker Northwood Iowa and W F Sudro, Fargo, North Dakota

OKLAHOMA CITY EMPLOYS PHARMACIST

After quite a discussion of the Oklahoma City officials with the State Board of Pharmacy, Oklahoma City has decided to employ a registered pharmacist and Frank Weaver has been named as pharmacist There was quite a contention over the matter, the city attorney having ruled that Oklahoma City was within its rights in dispensing drugs without a pharmacist

FOUR NEW VETERANS' HOSPITALS TO BE OPENED

Four new veterans' hospitals with an aggregate capacity of 963 beds built at a cost of $3 002 014 are to be placed in commission as a result of liberalization of the veterans' relief regulations promulgated under the Economy Act of 1933 The institutions are in Batavia N Y, Cheyenne, Wyo, Des Moines, Iowa, and Fayetteville, Ark Two other hospitals are under construction a general hospital at San Francisco, and one for nervous and mental diseases at Roanoke, Va

THE WEIGHTS AND MEASURES LAW IN CHINA

The Commercial Counsellor at Shanghai reports that no detailed regulations have yet been issued for the Weights and Measures Law It is understood however, that invoices should be made out in conformity with the metric system and in order to avoid confusion goods should also be marked according to that system The units to be employed for this purpose are those of the international metric standard and not the Chinese adaptations thereof

EDITORIAL NOTES

The *New York Times* of April 15th, in commenting on the congratulations of Lord Rutherford to Drs Urey, Brickwedde and Murphy on the discovery of double weight hydrogen, expresses appreciation also because of the conspicuous part that Americans have played in physical research during the last two decades

The editorial concludes "In an era when the United States is looked upon abroad as the land of materialism, the place where only the profit-making motive counts, it is good to read Lord Rutherford's words and to realize that not only the spirit of scientific research, but the ability to carry on the work of the great, lies within our laboratories"

Some of the processes of pharmacy may become subjects of research in connection with the important discovery

QUALITY OR QUANTITY?

The *Oil, Paint and Drug Reporter* of April 9th, comments on a recent decision that "Many men will be of many minds with respect to a dictum of a United States Circuit Court of Appeals judge in a recent decision having to do with the regulation of business, for the opinion expressed clashes with many theories and with many views developed beyond the theoretical stage In fact, the judge's utterance is at variance with certain economic delineations set forth in the statutes of the United States and of a number of the States There are those who will find in the dictum disagreement with certain points of the popular conception of constitutional grants of individual rights"

Here is what the appellate jurist said

Surely, it is a mild assumption that the more vital interest in the end may demand that there be less goods sold at higher prices rather than that all existing manufacturers should remain in business He would be a hardy exponent of noninterference who should assert the opposite to day, if for instance the rise in cost was due to improvement in working conditions, or in the hygienic quality of the product

'DRUGGED FOODS"

The *Journal of the American Medical Association* states that "Medicating common food articles with drugs—such as the addition of phenolphthalein to chewing gum, acetylsalicylic acid to candy and senna to bread—is becoming a growing menace, and must be viewed with apprehension and concern as a danger to public health The general appearance of these drugged foods does not distinguish them from the respective non-drugged forms, label declaration of the added drugs cannot be expected to prevent their fortuitous misuse or their consumption by the uninformed, the unobservant or those unable to recognize the significance of label statements There is therefore, the ever-present likelihood that children, and even adults, may unsuspectingly or ignorantly consume such drugged foods with results that may be disastrous"

DEFINITION OF POISON

Dr John J Abel, retiring president of the American Association for the Advancement of Science, in his recent Boston address, said 'there is no definition of a poison in medical law of the United States or England No one has ever been able to give a concise and accurate definition of a poison that would apply to every one of the many thousands of known poisons" Dr Abel made this statement to emphasize how obscure is man's knowledge of poisons and how meaningless is the term in a basic sense 'Nature," he said, "has not affixed a poison label to any particular substance or class of substance The pharmacist does that" Whether a drug is poisonous or not depends on its use or the amount taken

REVISION OF BRITISH PHARMACEUTICAL CODEX

Under the direction of the Council of the Pharmaceutical Society of Great Britain, reports are being issued preliminary to revising sections of the British Pharmaceutical Codex The report of the pharmacy sub committee presents a summary of the principal new or revised formulas recommended by it for inclusion in the British Pharmaceutical Codex of 1934 The sub-committee recommends the inclusion of formulas for a number of preparations from earlier pharmacopœias which are not included in the British Pharmacopœia of 1932 but are still in more or less frequent demand Useful comments on the proposed formulas will be appreciated by the editor, C E Corfield, 17 Bloomsbury Square, London, W C 1, England

PERSONAL AND NEWS ITEMS

Dr Frank A Delgado has been appointed Administration Member of the National Drug Code Authority

Lester E Bishop, of Laurens, S C , has been named associate editor of the *Southeastern Drug Journal* He is president of South Carolina Pharmaceutical Association and member of South Carolina Board of Pharmacy

Dr John J Abel was awarded the Kober medal for 1934 for scientific research; in 1928, he was awarded the gold medal of the London Society of Apothecaries

Our senior ex president John Uri Lloyd celebrated his 85th birthday, April 19th, he has been a member of the ASSOCIATION since 1870, and served as president 1887–1888

Our fellow-member Hugo Kantrowitz celebrated his 80th birthday on April 8th

Prof Charles W Greene, professor of physiology and pharmacology at the University of Missouri, was elected president of the American Physiological Society at the New York meeting

William F Smith, pharmacist in Perth Amboy, N J , and graduate of New Jersey Law School has been appointed special Assistant U S District Attorney for New Jersey

President C Thurston, of the National Association of Boards of Pharmacy, has been commissioned a Colonel by Governor Ruby Lafoon of Kentucky

Prof Gustav Bachman, Minnesota Pharmaceutical Association, has declined reëlection as secretary for the term beginning February 1935, at which time he will be succeeded by A Roy F Johnson, *executive secretary* C V Netz will continue as *acting secretary* until February 1935 He will serve as field secretary during the summer months Professor Bachman sustained serious injuries in an automobile accident some time ago

Wroe Alderson has resigned as assistant chief of the domestic division of the U S Bureau of Foreign and Domestic Commerce He is now director of a Research Bureau New York, organized for research activities for manufacturers, distributors and trade associations

William H Johnson, who has been acting as executive secretary of the National Retail Drug Code Authority since its organization, has resigned that position and has been succeeded by Paul Pearson, Washington, who has taken over Mr Johnson's duties with title of assistant secretary Mr Pearson for twenty-four years has been president of the Washington Wholesale Drug Exchange and is president of the District of Columbia Pharmaceutical Association

D D Adams, after long years of service, has retired as treasurer of Nebraska Pharmaceutical Association

P O Bugge, Bisbee, No Dak , noting the article in the A PH A JOURNAL on Henrik Ibsen referred to his winning a national prize, in 1927, for his poem on Henrik Ibsen, presented in a contest at the time of the Ibsen centennial celebration in Minneapolis

Charles Morgan, of Morgan & Millard, Baltimore, states that while gain in business volume is not large, the trend is toward pharmaceuticals

A PRICE LIST TO BE COMPILED

The Retail Drug Code Authority in conference, on April 18th, acted upon the suggestion that there should be compiled a price list for drug products, which could be used as the official price list in the interpretation of "cost" under Section 6 of the Retail Drug Code These prices are based on the "manufacturer's wholesale list price per dozen ' and will include all discounts, free goods, etc , as defined in the recent amendment to the Retail Drug Code

A preliminary list of 400 items will be compiled, and to this will be added all items essentially necessary for the use of the various code authorities Corrections to the list will be made immediately upon the issuance of any new price list by the manufacturer

PRICE REGULATION FOR RETAIL DRUG TRADE

The National Recovery Administration, on April 19th announced issuance of an order under which a drug retailer may reduce his price to meet the price of a competitor until such time as the National Retail Drug Code Authority, or the Local Authority, shall have announced a price which shall be *prima facie* evidence of the correct price

Upon announcement of this *prima facie* correct price by the Code Authority, the new order provides that reductions below such announced price shall constitute a violation of the code unless the retailer is able to prove that the correct price is lower than that announced by the Code Authority

The new order becomes effective immediately

OBITUARY

FLORIN J AMRHEIN

Florin J Amrhein, Assistant Professor of Chemistry at Massachusetts College of Pharmacy and member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1916, died March 30th He had been in poor health for several months and was to undergo a surgical operation on March 31st The deceased was born in Boston August 3, 1892 the son of John and Catherine (Luzio) Amrhein

Professor Amrhein graduated from the Boston Latin School Boston University, and from Massachusetts College of Pharmacy in 1915, he also studied at Massachusetts Institute of Technology Soon after graduating from the Massachusetts College of Pharmacy he was elected a member of its faculty

Professor Amrhein was *Grand Regent* of Kappa Psi The deceased is survived by his widow, Dr Elizabeth McCarty Amrhein, and a son, Florin Jr to whom sympathy is expressed

The news of Professor Amrhein came as a shock as the writer had been in correspondence with him during the week before his passing a paper by him is printed in the March issue of the JOURNAL In recent years he had been interested in Vitamin D research

H E BENFIELD

Herbert E Benfield, member of the AMERICAN PHARMACEUTICAL ASSOCIATION and pharmacist of Cleveland, Ohio died February 26th following a heart attack At the time of his death Mr Benfield conducted two pharmacies in Cleveland He was active in organization work and highly esteemed by his co workers and patrons The deceased is survived by his widow and a brother C W Benfield, pharmacist of Solon Ohio

EUSTACE H GANE

Eustace H Gane, member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1895, died at his home in Montclair, N J, March 23rd, aged 64 years For twenty-five years, prior to establishing the firm of manufacturing chemists of Gane & Ingram, in 1923 he was associated with McKesson & Robbins At the time of his passing Mr Gane was in the midst of plans for further expansion of the business he had founded and successfully conducted Mr Gane was well and favorably known and a frequent contributor to the Scientific Section of the ASSOCIATION, and gave freely of his knowledge to those who came to him for advice He held membership in the Chemist Club and Drug and Chemical Division of New York Board of Trade

HARVEY H ROBINSON

Harvey H Robinson, member of the AMERICAN PHARMACEUTICAL ASSOCIATION, president of the Henry B Gilpin Company, wholesale druggist, Baltimore, died March 30th after a brief illness, aged 62 years

After completing a business course in Baltimore, he entered the employ of Gilpin Longdon & Company as a clerk When the company reorganized as the Henry B Gilpin Company Mr Robinson became treasurer, in 1910 he became vice president and general manager and, in 1916, he was made president

Mr Robinson was interested in civic and social activities, resulting in Boys' Brigade predecessor of the Boy Scouts, he served as chairman of the Baltimore committee on public athletics and community work He was active in the work of the national drug trade bodies and in all movements designed to benefit the trade He served as president of the Baltimore Drug Exchange, as a member of the board of control and as vice president and on various N W D A committees In the work of the latter to formulate and adopt an NRA code, he was one of the foremost workers Mr Robinson held membership in the Masonic bodies, the Baltimore Merchants Club and the Rolling Road Golf Club He is survived by his wife Mrs Edna Sarah Robinson, two daughters Misses Mazie E and Rebekah O Robinson, his mother Mrs Elizabeth A Robinson, a brother, John O Robinson, and a sister, Mrs Walter Lee Simmons

FRANK B STEPHENS

Frank B Stephens, member of the AMERICAN PHARMACEUTICAL ASSOCIATION and a former president of Florida Pharmaceutical Association died at a St Augustine hospital after a brief illness, aged 65 years He was an honor graduate of the University of Chicago and before coming to St Augustine operated three drug stores in Toledo, Ohio

Mr Stephens had been engaged in pharmacy at St Augustine for 28 years and was one of the most active workers in Florida pharmacy He was a member of the Masonic bodies His widow, a brother and a sister survive him

WALTER B SWINDELL

Walter B Swindell, president of the Swindell Brothers Glass Company, died at his home in Baltimore following a heart attack The deceased was born in Baltimore in 1850, and with his father, the late William Swindell founded the glass company of which he was head, in 1869 A brother Charles J B Swindell, a son Walter B Swindell, Jr, and three daughters survive the deceased

DR J F SCHAMBERG

Dr Jay Frank Schamberg, professor of dermatology at the medical school of the University of Pennsylvania, Philadelphia, and widely known as one of the co producers in the United States of synthetic salvarsan during the war when supplies of the product were cut off from Germany, died March 30th at his home in Philadelphia, aged 63 years He was a graduate of the Medical Department of the University of Pennsylvania in 1892 and continued his studies in Europe and then practiced in Philadelphia specializing in dermatology and syphilology With Drs George W Raiziss and Dr John A Kolmer, he succeeded in manufacturing salvarsan, in the United States and the $750,000 profits resulting therefrom were donated to the Research Institute of Cutaneous Medicine Dr Schamberg is survived by his wife and two children

Alfons Adolph, who invented view post cards, died in Passau, Germany March 28th, aged 80 years With a special press he printed the first card in 1879 and it was followed by world wide popularity

SOCIETIES AND COLLEGES

ANNOUNCEMENT BY CHAIRMAN BRADLEY OF THE COMMITTEE ON TRANSPORTATION

The Identification Certificate Privilege has been secured from the various railroad passenger associations for the 1934 meeting in Washington This entitles the members to buy tickets for themselves and dependent members of their families, on certificates sent out by Secretary Kelly, for one and one third fare for the round trip, going and returning by the same route or by diverse routes

The following regulations governing the sale and use of these tickets have been received from the Central Passenger Association and similar regulations apply to the sale and use of tickets from points in the territories of other passenger associations

(*a*) Round trip tickets at one and one-third fare (with minimum of $1) for the round trip, on Identification Certificates good *via* same route in both directions will be sold from the above-mentioned territory from April 28th to May 9th, inclusive and before being honored for return passage, return portions thereof must be validated (in space provided therefor) at Washington D C, or Baltimore Md, by ticket agents dating stamp at the regular ticket offices of the lines over which tickets read into Washington, D C, or Baltimore Md from April 30 1934, to and including thirty days in addition to date of sale and when validated tickets will be good for return leaving on any day within final limit, passenger must however, reach original starting point within transit limit shown on ticket

(*b*) For tickets *via* diverse routes Round-trip tickets will also be sold on the one and one third fare basis, going *via* any authorized route published in one way tariffs, returning *via* any other authorized route published in one way tariffs the round trip fare being computed by using one half of the round-trip fare (that is half of the $1^1/_3$ fare) from starting point to destination applying *via* route used on the going trip, plus one half of the round-trip fare (that is half of the $1^1/_3$ fare) from starting point to destination applying *via* route used on the return trip Return portions of tickets must be validated at destination by ticket agents' dating stamp at regular ticket offices of lines over which tickets read returning from place of meeting to original starting point Return limit 30 days in addition to date of sale selling dates and other conditions to be the same as will apply in connection with tickets issued *via* same route in both directions (Item 'a")

Children of 5 and under 12 years of age when accompanied by parent or guardian will under like conditions be charged one half of the fare for adults

It will be necessary for members, when purchasing round-trip tickets to present and surrender the Identification Certificate issued account of your meeting and to indicate to ticket agents which ticket is desired—namely

(1) One and one-third fare for round trip,

good *via* same route in both directions, final return limit 30 days in addition to date of sale

(2) One and one third fare for round trip, going *via* any authorized route and returning *via* another authorized route, final return limit 30 days in addition to date of sale

PAPERS FOR ALL A PH A SECTIONS AND CONFERENCES

Contributors of papers should send their papers to the Section and Conference Officers promptly If the papers are not ready send in the titles, also abstracts of the papers

Officers of the Sections and Conferences are printed in the March issue of the JOURNAL, pages 278 and 279

Programs of the Sections will be printed in the Official Program

TENTATIVE GENERAL PROGRAM FOR THE EIGHTY-SECOND ANNUAL MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION AND RELATED ORGANIZATIONS, HOTEL SHOREHAM, WASHINGTON, D C , MAY 7–12, 1934

All dates included in special fare arrangements with railroads

MAY 6–7

Plant Science Seminar Program and Meeting Rooms to be arranged A field trip will be arranged for Sunday, May 6th

SATURDAY, MAY 5

National Conference on Pharmaceutical Research—Club Room Meetings at 2 00 P M and 8 00 P M

Dinner between afternoon and evening sessions at Hotel Shoreham

SUNDAY, MAY 6

American Council on Pharmaceutical Education—Time and Place to be arranged

MONDAY MAY 7

SCIENTIFIC SECTION

The 82nd annual meeting will be held in Washington, D C, during the week of May 7th, and will include the dedication of the new headquarters building The Scientific Section plans to hold several interesting sessions but in order to accomplish this the officers must have your coöperation

Since the Convention date is much earlier than usual, it will be necessary for authors of papers to submit titles and very short abstracts to the secretary promptly in order that the titles may appear in the printed program Authors should indicate whether the papers are to be presented in person or by title and should bear in mind that ten minutes is the time limit for the presentation of a paper

L W ROWE *Secretary*, Scientific Section, c/o Parke, Davis & Co, Detroit, Michigan

F E BIBBINS *Chairman*, Scientific Section

SECTION ON HISTORICAL PHARMACY

The forthcoming meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION will be an occasion of unusual interest because it will be held at *home*, in Washington, May 7th That fact alone will be one of great historical significance to the ASSOCIATION and its friends

This meeting should be one of the best for the Historical Section, and you are invited to present a paper upon some phase of historical pharmacy

Papers that are submitted become permanent records in the archives of the ASSOCIATION

Pictures and photographs greatly enhance the value of papers The stories of men, institutions and associations of pharmacy are always interesting Send us the *titles and abstracts* of your stories at your earliest convenience

We are all making pharmacy history Let's record it

C O LEE, *Secretary*, Purdue University, Lafayette, Ind

Programs of all Sections are developing nicely

PROGRAM, LAW ENFORCEMENT OFFICIALS

1 Call to Order
2 Remarks of Chairman, Robert L Swain
3 Report of Secretary, M N Ford
4 Report of Finance Committee

ADDRESSES

'The Place of the Attorney General in the Legislative and Law Enforcement Program Hon Herbert Levy, of the Maryland Bar"

'Is Pharmaceutical Legislation Best Served by a Pharmacist Member of the Legislature?, Frank C Purdum, Pharmacist Member of the Maryland Legislature and Harry E Bischoff, Pharmacist Member of the New Jersey Legislature"

"The Public Health Council of Kansas and the Value of Its Principles to the Pharmaceutical Program, W Mac Childs, *Secretary*, Kansas Board of Pharmacy'

"The Place of the Control Laboratory in the Enforcement of the Food and Drugs Act, William F Reindollar, Bureau of Chemistry, Maryland State Department of Health"

"Report of Special Committee to Define the Terms, 'Patent Medicine' and 'Proprietary Medicine,' A L I Winne Virginia, *Chairman*"

"The Enforcement of State Poison Laws, George W Mather, *Secretary*, New York Board of Pharmacy"

"Coöperation between Federal and State Officials in the Enforcement of the Food and Drug Acts, W S Frisbis United States Department of Agriculture"

"Informal discussion of enforcement procedure, inspection technic legislative and other matters of special interest to the Conference'

TOPICS FOR ROUND TABLE DISCUSSION, CONFERENCE OF PHARMACEUTICAL ASSOCIATION SECRETARIES

'Is it desirable if so is it possible to form a National Association from the various State Associations with every member of the State Association automatically a member of the National Association without payment of additional membership dues?"

Discussion opened by A L I Winne, secretary Virginia Pharmaceutical Association

"Is a State Drug Code desirable in addition to the National Code?"

Discussion opened by Prescott R Loveland, secretary, N J Pharmaceutical Association

"Since the State Associations have been ignored in the National Drug Code set up, what should be the attitude of the State Associations to Code matters?"

Discussion opened by J Lester Hayman, secretary, West Virginia Pharmaceutical Association

'Can a plan be evolved whereby one membership fee can be made to cover State and National Association dues?"

Discussion opened by R A Turrel, secretary, Michigan State Pharmaceutical Association

The organization of Congressional Districts or County Units"

Discussion opened by J W Slocum secretary, Iowa Pharmaceutical Association

'Is the handling of liquor in drug stores under prohibition repeal on a satisfactory basis? What changes or improvements should be made?"

Discussion opened by F V McCullough secretary, Indiana Pharmaceutical Association

"Is it desirable, if so is it possible to have this Conference submit to each State Association each year some suggestions as to the program with the idea of unifying our efforts toward some definitive objectives, National in scope?"

Discussion opened by W D Adams, secretary, Texas Pharmaceutical Association

Is there a desirability and a possibility of holding joint meetings of the Pharmaceutical Associations with the State Medical and Dental Associations?"

Discussion opened by E F Kelly, secretary, Maryland Pharmaceutical Association

What steps can be taken through Association channels to curb the practise of manufacturers packaging 10¢ sizes of proprietary medicines and cosmetics for distribution through department stores?"

Discussion opened by Roy C Reese, secretary, Kansas Pharmaceutical Association

To what extent can the professional phases of Pharmacy be made a part of our programs?"

Discussion opened by J G Beard secretary, North Carolina Pharmaceutical Association

PROGRAM OF NATIONAL CONFERENCE ON PHARMACEUTICAL RESEARCH, 1934 MEETING

WASHINGTON D C SATURDAY, MAY 5, HOTEL SHOREHAM

First Session, 2 00 P M

1 Call to Order by Chairman
2 Appointment of Nominating Committee
3 Summary of Year's Activities and Outlook of Conference for the Future by Chairman E N Gathercoal
4 Reports of Officers
  a Report of Secretary
  b Report of Treasurer
  c Report of Executive Committee by Secretary
5 Reports of Standing Committees
  (1) Pharmaceutical Dispensing, W J Husa, *Chairman*
  (2) Manufacturing Pharmacy, L W Rising, *Chairman*
  (3) Medicinal Chemicals George D Beal, *Chairman*
  (4) Pharmacognosy, H W Youngken, *Chairman*
6 Roll Call of Delegates
7 Adjournment for dinner Arrangements will be made for a dinner for the delegates assembled

An address pertinent to the work of the Conference will be delivered

Dinner between afternoon ond evening sessions at Hotel Shoreham Dr Carl Voegtlin, Pharmacology Director of the National Institute of Health, will be the guest speaker

Evening Session, 8 00 P M

8 (5) Pharmacology, J C Munch *Chairman*
  (6) Bacteriology, Immunology and Endocrinology, A R Bliss, *Chairman*
  (7) Physical Chemistry, Arthur Osol *Chairman*
  (8) Educational Methods, A B Lemon, *Chairman*
  (9) Pharmaceutical Economics, P C Olsen, *Chairman*
  (10) Historical Pharmacy, C H LaWall, *Chairman*
9 Reports of Other Special Committees
  (1) Fellowship Award J C Krantz, Jr, *Chairman*
  (2) Publications E N Gathercoal, *Chairman*
  (3) Census of Research J C Munch, *Chairman*
10 General Discussion of the Status of Pharmaceutical Research
11 Election and Installation of Officers
12 Adjournment

ROCKEFELLER INSTITUTE OF PUBLIC HEALTH IN JAPAN

A Rockefeller Institute of Public Health, attached to the Tokyo Imperial University has been arranged for It is expected that the proposed construction of the buildings will take two years A hospital will be built in Kyobashi ku Tokyo, for the actual training of the students, and another local hospital will be built at Tokorozawa, Saitama Prefecture Both of these hospitals will be contributed to the prefectures in which they are located

A D M A CONVENTION

The American Drug Manufacturers' Association held their twenty-third annual meeting, April 17th to 19th inclusive, at the Greenbrier Hotel White Sulphur Springs, W Va An interesting program of the sectional meetings was carried out and several important addresses delivered at the business sessions, one by H J Anslinger Commissioner of Narcotics on Newly Discovered Narcotic Drugs and Their Uses" The speaker at the annual banquet was Mrs Ida Wright Bowman, for many years on the staff of current history lectures for the League for Political Education in New York In past years she has studied international affairs abroad

TEXAS WILL BE WELL REPRESENTED IN WASHINGTON

The Texas Board of Pharmacy will attend the Washington meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION in a body Officers of the State Association and other Texas pharmacists will be in the party, an interesting trip has been planned, assembling in Dallas Leaving St Louis the members will arrive at Staunton, Va, visit Monticello and other points in Virginia and arrive in Washington, May 7th Leaving Washington after conclusion of the convention they will go to New York where they will be guests of the National Broadcasting studios for a full program and return by way of Canada to Chicago and visit the Century of Progress

LEGAL AND LEGISLATIVE

THE NEW COST DEFINITION

"Inasmuch as the vast preponderance of drug store products are distributed to small drug retailers who are unable to purchase on a quantity basis but who perform services which are essential to the welfare of those in their communities, and whereas such services cannot adequately be performed through the facilities provided by their competitors, and whereas in some cases sales are made to consumers by such competitors at prices below the lowest cost of purchase normally obtainable for such merchandise by small drug retailers, and whereas in most instances such sales prices are not a true indication of the general level of prices of such competitors and no general benefit to those in the community accompanies the same, but such prices are in fact in the nature of bait offers of merchandise to attract trade

"It is hereby declared unfair trade practice and is prohibited by this code for any drug retailer to sell any drugs, medicines, cosmetics, toilet preparations or drug sundries at a price below the *manufacturer's wholesale list price per dozen*, provided however, that in the case of biological or other of the above mentioned products which are not customarily sold in dozens or gross lots, the Code Authority may fix a comparable unit quantity, and provided further that any discount, free deal or rebate which is made available to all purchases of *dozen lots* or comparable quantities shall be considered as part of the manufacturer's wholesale list price "

NATIONAL RECOVERY ADMINISTRATION BEING TRANSFORMED TO CODE-ENFORCEMENT BODY

The long proposed transformation of the National Recovery Administration from a code-making to a code enforcing agency is definitely under way, but the objectives of using codes to increase employment while protecting labor and consumers remain prominent in NRA activities

Tentative orders issued by Administrator Hugh S Johnson not yet fully in effect completely reorganize the NRA deputizing authority to lesser officials and providing machinery for quick disposal of complaints of violations of codes The administrator will retain a veto power but each of the half dozen divisions of the NRA will be largely autonomous and will have authority to dispose of all matters except those involving policies not definitely settled

Reorganization of the NRA is being conducted by W Averill Harriman, division administrator, temporarily in the capacity of first assistant to the administrator Details of the NRA organization have become so voluminous that it is necessary to perfect an organization not so centered on the administrator personally as it has been to date To this end each division will be made practically autonomous for purposes of code administration each with its own group of legal, labor industrial and consumer advisors

A new litigation division is being carved out of the legal division which will have the responsibility of bringing court actions against violators in cases where the code authorities have not been able to secure compliance with the code —*Oil Paint and Drug Reporter*

FIRMS MUST PAY NRA CODE COSTS OR FORFEIT EAGLE

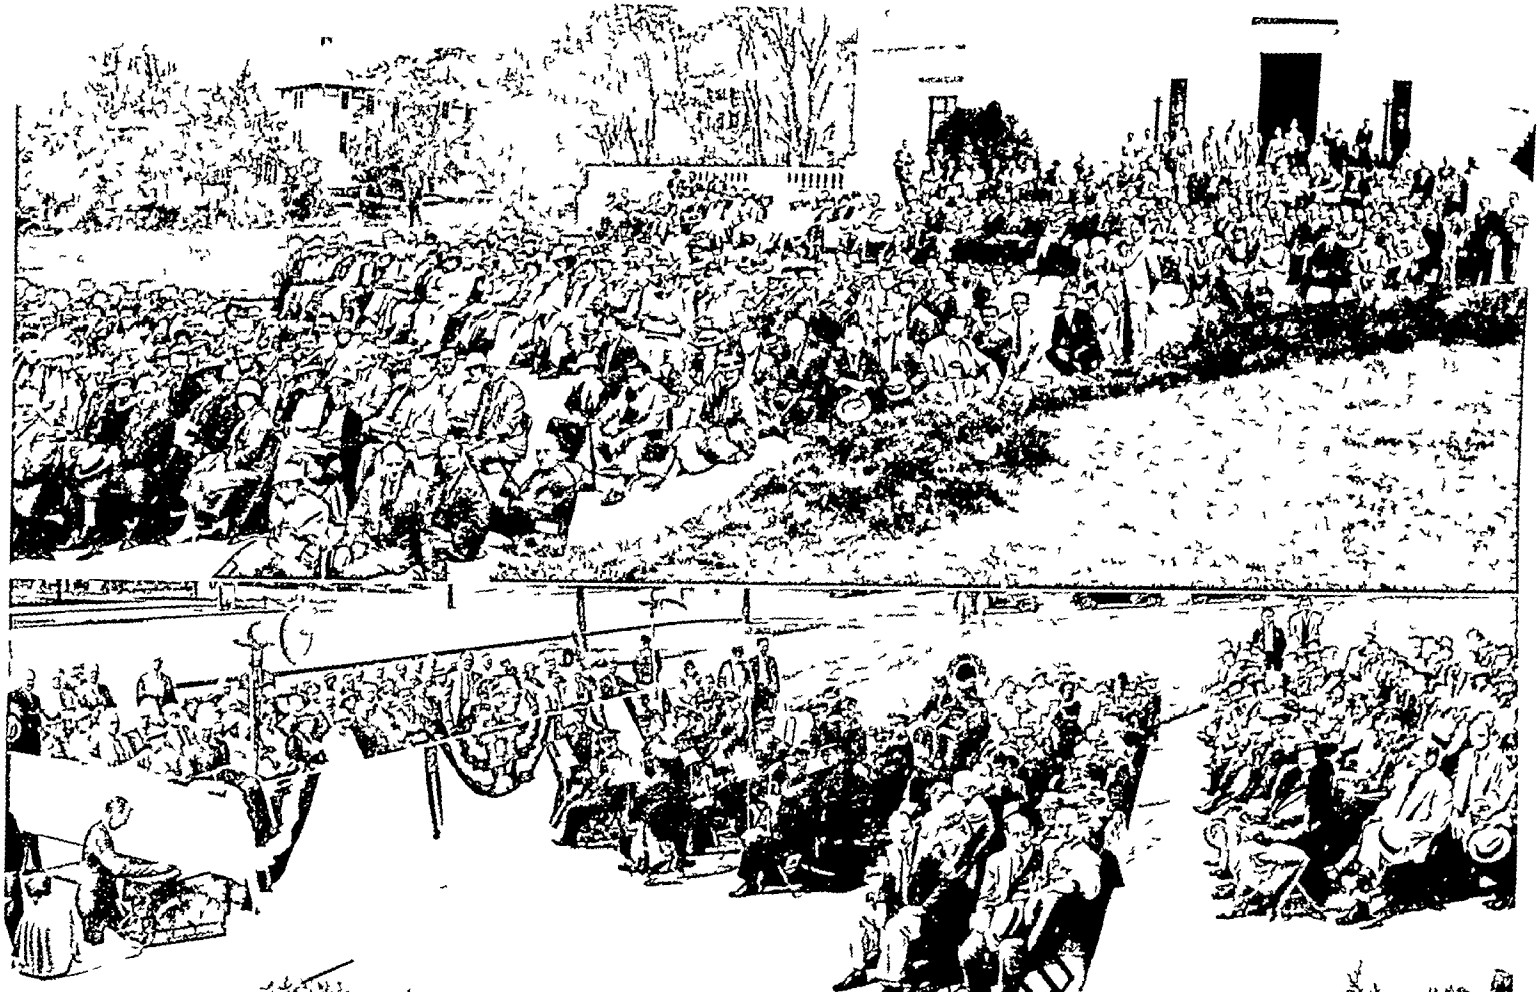
President Roosevelt, on April 14th issued an order under which future display of the Blue Eagle will be allowed only to those firms which contribute to expenses of code administration, wherever such outlays are required

To protect employers from racketeering by organizers of industrial groups, the President required that all Code Authority rates of assessments and budgets of expenditures must be approved by Administrator Hugh S Johnson before any money can be collected

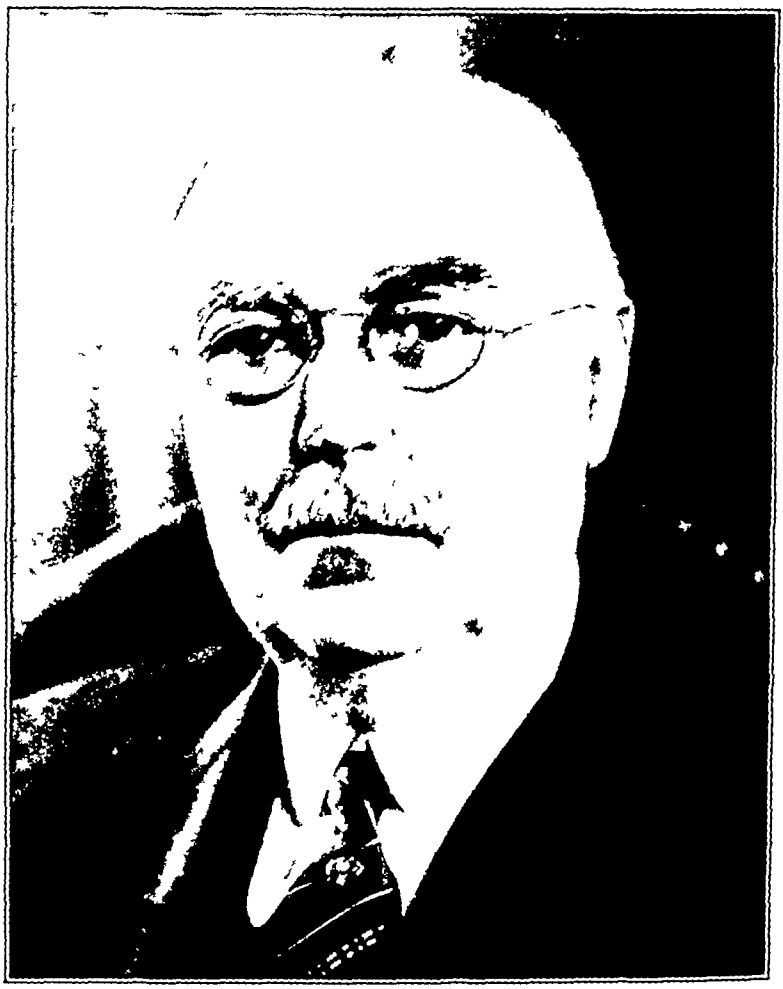
The executive order does not command that every firm under every code pay dues, but substantially leaves this government controlled method of financing administration the only avenue which may be followed

Industries, under the order, will not be required to, but will have the right to apply to NRA for approval of a financing plan, which shall be put into effect if Administrator Johnson "shall find approval by him of such a clause is necessary "

Non payment will constitute violation of the code, subject the firm involved to withdrawal of the Eagle, deprivation of all other code privileges and expose it to suit for collection on the part of the Code Authority



The Dedication Exercises of the American Institute of Pharmacy The half-tone is made in two sections—the speakers stand below on left and the participants in the ceremony continued in upper plate



JOSIAH K LILLY
Honorary President A PH A, 1934–1935

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIII MAY 1934 No 5

THE HONORARY PRESIDENT OF THE A PH A, 1934–1935

Josiah K Lilly, elected honorary president of the AMERICAN PHARMACEUTICAL ASSOCIATION at the Washington meeting, became a member of the ASSOCIATION in 1890 He is the son of the founder of the Lilly Laboratories and was born at Greencastle, Ind, in 1861 In 1873 the family moved to Indianapolis

After concluding the studies in the public schools of Indianapolis, Mr Lilly enlisted as a student in Asbury College, now DePauw University, and after that he entered the employ of his father, who had established a pharmaceutical manufacturing plant In 1880 he matriculated at the Philadelphia College of Pharmacy and graduated in 1882 Returning from college he was made superintendent of the laboratories and held this position until the death of his father in 1898, whom he succeeded as president of the company and held this office until January 1932 He is thoughtful of those who cooperate with him and is highly regarded by his coworkers in the industry Mr Lilly takes an active interest in civic affairs and the promotion of endeavors for the betterment of city and state

For many years Mr Lilly has been helpful in the advancement of the work of the Indianapolis Y M C A, of which he served as president and during that time the movement was started for the construction of the present building, he is custodian of a fund of several million dollars, administered for the welfare of the community Higher educational work in Indiana has always interested Mr Lilly and he has made substantial gifts to Butler and DePauw Universities and Wabash College He is a member of the Board of Trustees of Purdue University His interest in the American Institute of Pharmacy is always in evidence

Through his love of music, Mr Lilly has brought to Indianapolis what is understood to be the most comprehensive collection of the poems and songs of Stephen Collins Foster He has built a shrine on his farm near Indianapolis, known as Foster Hall, in which there is a magnificent organ and a repository of a large number of the works and mementoes of the composer

In 1882, Mr Lilly was married to Miss Lily M Ridgely[1] of Lexington They have two sons, Eli, now president of Eli Lilly & Co, and Josiah K, Jr, a vice-president

[1] Deceased April 1934

EDITORIAL

E G EBERLE, EDITOR 2215 Constitution Ave , WASHINGTON, D C

THE AMERICAN PHARMACEUTICAL ASSOCIATION MEETING OF 1934

THE Washington Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION and associated and related organizations was an outstanding success The National Conference on Pharmaceutical Research was well attended and the members were favored by Dr Carl Voegtlin, speaker of the evening Both the American Association of Colleges of Pharmacy and the National Association of Boards of Pharmacy registered well-represented delegations, general satisfaction of their work was expressed by the members The Joint Session of the latter bodies was addressed by Senator Royal S Copeland on "Food and Drug Legislation," another speaker was President Mordecai Johnson, of Howard University

More than five hundred guests participated in the annual banquet, the interest of which was enhanced by the presentation of the Remington Honor Medal to Sir Henry S Wellcome A report of this function is printed in another section of the JOURNAL and also the addresses of the several presiding officers of the organizations, assembled in convention

The Dedication Exercises were outstanding features of the program of the meeting and are reported in succeeding pages of this issue, and continued in the General Session on Thursday afternoon An intense and lively interest prevailed throughout the discussions which were directed by Chairman H A B Dunning

The House of Delegates, the Conferences of Pharmaceutical Association Secretaries and of the Law Enforcement Officials held profitable and representative sessions, the transactions of these bodies will be reported in a succeeding number of the JOURNAL

All of the sections were well attended and in all of them a large number of timely papers were read and discussed, abstracts of some of these will appear in current issues of the JOURNAL, prior to their publication

The entertainment features received favorable comment, they included dinners, dances, sight-seeing tours in and about Washington, fraternities enjoyed the opportunities afforded by the annual event, the former presidents of the ASSOCIATION dined together and discussed earlier meetings and gave thought to possibilities taking shape with the opening of the American Institute of Pharmacy Their ladies, Mrs H M Whelpley and Mrs John G Godding, graced the table The veteran druggists of many cities joined in the annual get-together feast in a spirit of growing younger, even though time may disagree with them The local committees carried out a successful program with a purpose of impressing Washington hospitality on the visitors

The expression was general that Pharmacy had a building in which pharmacists have pride, beautiful in design and architecture and furnishings Congratulations came from all sections of the United States, Canada and Europe, and representatives, as will be seen from the programs, were cordial in their felicitations and the ASSOCIATION was honored by a message from President Franklin D Roosevelt

The dedication of the American Institute of Pharmacy added lustre to the successful convention, the addresses were timely, and conveyed worth-while and thoughtful messages

The convention of 1934 marks an epoch in pharmaceutical history and progress

---

MESSAGE OF THE A PH A PRESIDENT

THE relatively short ASSOCIATION year, which came to a close on May 11, 1934, was packed with events of utmost importance to American Pharmacy Climaxed by the dedication of the American Institute of Pharmacy on May 9th, the convention of the AMERICAN PHARMACEUTICAL ASSOCIATION and associated and related organizations, held in Washington May 7th to 11th, inclusive, gave evidence of the deep concern with which those who are engaged in the endeavor to preserve and advance the interests of professional pharmacy, are approaching the problems of the day

No reference to the events of the busy convention and dedication week would be complete without a tribute to the high degree of excellence of the addresses given by retiring President Swain on the occasion of the dedication of the American Institute of Pharmacy and at the first general session His recommendations embodied in the presidential address offer a groundwork for constructive effort in the year to come The resolutions growing out of the work and activities of the Sections and Conferences affiliated with the ASSOCIATION will help to guide the immediate activites of the ASSOCIATION in its new location

We have a "long year" ahead of us because of the early date of the Washington Convention The tendency may be to put things off, but we cannot afford to delay action on the activities which American Pharmacy expects to have us prosecute with renewed vigor, because of the inspiration that has come to all of us from the realization of the dream of a permanent institution to house our activities

In the near future committee appointments will be made I hope that no one will accept a committee assignment unless it is with the intention of doing the work that accompanies the assignment It is my further hope that all committees and all who will contribute papers to the next convention will make their plans known to the proper authorities not later than May 1, 1935 There is no good reason why the annual programs of papers and reports should not be printed in full in the JOURNAL at least one month before the convention With your cooperation it can be done

In expressing to the members of the AMERICAN PHARMACEUTICAL ASSOCIATION my appreciation of the high honor which they have conferred upon me in calling me to the presidency, I desire at this time to pledge my loyalty to the principles for which the ASSOCIATION stands and my earnest endeavor to promote the welfare of the ASSOCIATION and its members at all times to the best of my ability I sincerely hope that I may have the whole-hearted cooperation of all who are called upon to serve on committees, delegations and conferences It will be a pleasure to receive communications relating to the welfare of the ASSOCIATION at any time from any member and I assure you that constructive criticism and suggestions will be welcome —ROBERT P FISCHELIS, *President*

SCIENTIFIC SECTION

THE ASSAY OF HYOSCYAMUS *[1]

BY MARVAL D EVANS AND EDWARD D DAVY

The conflicting reports which have made their appearance from time to time as to the proper procedure in the assay of mydriatic drugs, particularly *Hyoscyamus*, led to the study here reported Likewise, results of different analysts did not agree even when the same or a similar method was employed

A few of these differences of opinion are enumerated Watkins and Palkin[2] attribute some of the difficulty to the presence of earthy soaps Stikarofsky[3] suggests that since the alkaloids are sensitive to heat the operator did not observe sufficient caution while evaporating the final solvent Hester and Davy[4] found in *Datura Innoxia* interfering ammonium compounds Goris and Larsonneau[5] found that Belladonna leaves contain volatile bases of alkaloidal and non alkaloidal nature Ewe[6] called attention to these volatile bases in the assay of Hyoscyamus and offers a method for their elimination U S P X cautions against the application of heat in evaporating the solvent to avoid decomposition of the alkaloids

EXPERIMENTAL

Hyoscyamus samples marketed as U S P were purchased with a view to finding a drug that might yield volatile bases other than ammonia when assayed The presence of ammonia was definitely established in *Drug I* Another lot of drug, hereinafter referred to as *Drug II*, was found which yielded volatile, chloroform soluble material in contrast to the former which was water soluble only The work on the crude drug was confined to these two samples

In the results enumerated the U S P X method was followed with modifications of the technique in dealing with the final chloroformic extract

All results reported are expressed in parts per hundred

A U S P X method, with due consideration of the precaution against the application of heat

I (*a*) 0 0433 (*b*) 0 0437 II (*a*) 0 0689 (*b*) 0 0675

B U S P X method modified slightly to determine if volatile alkaline substance was present *Drug I* The final chloroformic extract was evaporated on a water-bath to 5 cc, then to dryness with continued heating with a current of dry

---

[6] George Ewe JOUR A PH A 21 (1932), 870

carbon dioxide and ammonia free air, drawn slowly through the flask the vapors being passed into standard acid The passage of air over the residue and the heat were continued for ten minutes after the chloroform had been completely removed The contents of both flasks were titrated and calculated as alkaloid

I	Alkaloid	(*a*) 0 0306	(*b*) 0 0309
	Volatile material	0 0092	0 0086
	Total	0 0398	0 0395

C The same procedure was followed as in B except that ammonia-free water was used in the flask receiving the vapors instead of standard acid The aqueous solutions of volatile material from two samples were Nesslerized and the presence of ammonia established qualitatively Two additional samples were compared to a standard ammonia The chloroform fraction showed no basic material

		(*a*)	(*b*)		(*c*)	(*d*)
I	Alkaloid	0 0312	0 0296		0 0302	0 0309
	Ammonia qualitative	+	+	(Quant)	0 0081	0 0053
					0 0383	0 0362

The same procedure was followed with *Drug II* except that equal portions of chloroform and water were used in the flask through which the vapors were drawn, as previous qualitative tests showed this drug yield volatile chloroform-soluble material The aqueous portion gave a very slight qualitative test for ammonia when Nesslerized The chloroform portion was titratable

		(*a*)	(*b*)
II	Alkaloid	0 0374	0 0364
	Volatile chloroform soluble	0 0161	0 0185
	Total	0 0535	0 0549

The recovery of the volatile material was probably incomplete in both of these cases but the presence of ammonia in *Drug I* and chloroform-soluble material in *Drug II* was established

D U S P X method except that

1 *Standard acid was added to the last 5 cc of chloroform extract after which the chloroform* was evaporated on the water bath Volatile bases present as ammonia or amines are titrated as alkaloid since these are not volatilized appreciably until the chloroform is completely evaporated

I (*a*) 0 0509 (*b*) 0 0489 II (*a*) 0 0732

2 After titration of the samples above (D 1) each was made alkaline and reëxtracted with chloroform the chloroform evaporated to dryness and the residual alkaloidal material heated at water bath temperature for fifteen minutes to eliminate volatile bases

I (*a*) 0 0301 (*b*) 0 0290 II (*a*) 0 0352

These results compare favorably with those obtained in C where the heat of the water bath was applied

3 In order to determine whether ammonium compounds are formed during the assay each of the samples above (D 2) was made alkaline with ammonia and reëxtracted with chloro

form Standard acid was then added to the last 5 cc of chloroformic extract In event ammonium compounds soluble in chloroform are produced during the assay the values of *Drug I* should show a corresponding increase due to reforming the ammonium compounds when heat is not applied to the dry residue *Drug II* which yielded volatile chloroform soluble basic material should show no increase since it was eliminated when heated in (D 2) That is precisely what happened as shown by the results

I (*a*) 0 0405 (*b*) 0 0381 II (*a*) 0 0352

As a final check on the stability of the alkaloids of Hyoscyamus at water-bath temperature, two samples of *Drug II* were assayed by allowing the final chloroformic extract to evaporate to dryness, and the alkaloidal residue heated for ten minutes on the water bath, during which time two successive portions of 3 cc each of chloroform were added to the residue of each sample and evaporated The alkaloids were determined volumetrically

(*a*) 0 0370 (*b*) 0 0350

The titrated samples were made alkaline and reëxtracted with chloroform and the same procedure repeated

(*a*) 0 0370 (*b*) 0 0370

This offers added proof that heat applied for short intervals at full water-bath temperature causes no loss of alkaloids

BRITISH PHARMACOPŒIA

While the work previously reported was in progress the Sixth Revision of the British Pharmacopœia became available Accordingly two samples of *Drug I* were run by the British Pharmacopœial method with the following results

(*a*) 0 0303 (*b*) 0 0296

The chief objection to the method is the direction to reduce the aqueous solution *in vacuo* This is attended with considerable bumping and the transfer of liquid from the flask may occasion some loss On other occasions not recorded here we have used the ether-alcohol solvent in the initial extraction and find this a distinct improvement in the elimination of emulsions which are sometimes encountered with chloroform-ether solvent

MIXTURE OF ALKALOIDS

		Original No Heat Applied	Extracted Alkaloid Heated 15 Minutes
d-Hyoscyamine		0 0312	0 0318
l-Hyoscyamine		0 0300	0 0318
l Scopolamine	(*a*)	0 0286	0 0284
	(*b*)	0 0248	0 0246
Atropine	(*a*)	0 0243	0 0244
	(*b*)	0 0245	0 0242
Mixture calculated to hyoscyamine		0 0731	0 0729

The residual solutions after titration were tested for chlorides with negative results

EFFECT OF HEAT ON THE MYDRIATIC ALKALOIDS APPROXIMATING THE CONDITIONS ENCOUNTERED IN THE ASSAY OF THE CRUDE DRUG

Samples of pure *d*- and *l*-hyoscyamine hydrobromide, *l*-scopolamine and atropine sulphate were dissolved separately in water, ammonia added, and the alkaloids extracted with chloroform The chloroform was evaporated to 5 cc , standard acid added and the solution titrated after the chloroform had been removed by evaporation After titration each sample was made alkaline with ammonia and reëxtracted with chloroform The chloroform was completely evaporated at water-bath temperature and the residue heated for five minutes Three cc of chloroform were added to redissolve the residue, and the heating continued for ten minutes after the evaporation of the chloroform A mixture of these alkaloids was then made and the same procedure applied The results are given in the foregoing table

CONCLUSIONS

1 The present official and proposed methods of assaying Hyoscyamus do not give concordant results

2 The varying results obtained by chemists are due to volatile bases originally present, or formed during the assay, and extracted with the alkaloid, giving unusually high results

3 Evidence was found to substantiate both the ammonia and amine contentions and proof is given, within reasonable limits of experimental error, that the alkaloids of Hyoscyamus are not affected by exposure to the heat of the water-bath for fifteen minutes

4 It is recommended that the alkaloidal residue be heated for fifteen minutes at water-bath temperature, adding two successive portions of five cc of chloroform during the heating

---

THE ASSAY OF HYOSCYAMUS

BY H G DEKAY AND C B JORDAN

(*Continued from April Journal, page 322*)

III COLLABORATION WORK

Samples of the Hyoscyamus which we used in our experiments were submitted to a number of collaborators They were asked to perform the following assays

1 Hot Extraction Process (*6*)—Place 25 Gm of Hyoscyamus in No 60 powder in a thimble transfer to a Soxhlet apparatus and moisten with a mixture of 8 cc of stronger ammonia water, 10 cc of alcohol and 20 cc of ether, mix thoroughly, and macerate over night Extract for 3 or 4 hours on a water bath using ether as a solvent evaporate the extract to about 15 cc and then add 10 cc of approximately *N*/10 sulphuric acid and 10 cc of water and continue the evaporation until the ether is removed Filter into a 100-cc graduated flask, dissolve the chlorophyll residue in chloroform, add acidulated water and evaporate until the chloroform is removed then filter through the same filter into the graduated flask and make up to volume Make basic with ammonia T S and extract the alkaloids by shaking out with chloroform Test for complete extraction Evaporate or distil the chloroform to low volume, then to dryness on a water bath and keep at this temperature for 15 minutes Dissolve the residue in chloroform, evaporate to dryness on a water-bath and continue heating for 15 minutes Repeat this for the third time Take up the final residue in chloroform add 10 cc of *N*/50th acid remove the chloroform by evaporation and titrate the excess acid with *N*/50th base using methyl red as an indicator

2 Method 2—This was the U S P X process with the following modifications The

extractive was subjected to the purification process suggested The final chloroform extract was subjected to the same heating process as given in foregoing

The following results were obtained (7)

Worker		Method 1	Method 2
1		0 0406%	0 0409%
2		0 0462%	0 0673%
3	A	0 0452%	0 0272%
	B	0 0455%	0 024 %
4	A	0 051 %	0 0505%
	B	0 0517%	0 047 %
5	A	0 0416%	0 0576%
	B	0 0393%	0 052 %
6	A	0 047 %	0 0867%
	B	0 041 %	0 0717%
7	A	0 046 %	0 032 %
	B	0 044 %	0 031 %
	Average	0 0445%	0 0452%

The letters A and B designated two different assays of the drug sent a month apart

Method 1 has been recommended for consideration to the Sub committee on Crude Drug Assay of the U S P Revision Committee

From the results of these experiments we have come to the following conclu sions *1* That there is a volatile basic constituent obtained in the assay proc esses and *this gives the isonitrile test, 2*, the present U S P X process probably does not extract much of this basic constituent, *3*, if stronger ammonia water is used in this process, the basic constituent is extracted and the results are high, *4*, the process recommended by J J Durrett gives results too high because it ex tracts these volatile bases, *5*, the Watkins and Palkin purification process has decided advantages in securing sharp end-points in titration

IV TO DETERMINE BASIC CONSTITUENT

The problem now confronting us was the separation and identification of the volatile basic constituent or constituents which were evidently the cause of the discrepancies in the results of the assay processes as given on page 2 and the varia tion of results during our experiments

In order to obtain the volatile material, warm dry air was passed over the residues obtained upon the evaporation of the final chloroform extraction and passed through a weak acid solution A special drying apparatus was arranged in which the air was dried by passing it through a wash bottle of sulphuric acid, then through a calcium chloride and soda lime tower and then through a "U" tube which was heated by the water-bath The warm dry air was passed over the chloroform residue contained in a flask, which was heated at water-bath tempera ture, and then passed through a dilute hydrochloric acid solution Blank deter minations were made to test the apparatus A number of experiments were then made as follows

Experiment 1 A 50 Gm sample of drug was placed in a thimble in a Soxhlet apparatus macerated and extracted according to the method on page 391 The extract was purified and filtered into a 100 cc volumetric flask and then divided into two aliquot parts (A and B) These were made basic with ammonia water, shaken out with chloroform and the assay completed

The purpose of this experiment was to test the personal factor of the operator Percentages are expressed in terms of alkaloids

Sample	(A)	(B)
1	0 1225%	0 1217%
2	0 1366%	0 1326%
3	0 1272%	0 125 %

The personal factor can be disregarded

Experiment 2 50 Gm samples of the drug were extracted as in Experiment 1 and the extract was divided into two aliquot parts (A) was assayed in the usual manner, and (B) was made basic and extracted with chloroform which was evaporated to about 2 cc and placed in the drying apparatus with the temperature controlled at 40° C and the drying continued for 1 hour, the air being passed through a standard acid solution The final residue was taken up in chloro form, standard acid added, chloroform removed by evaporation and the assay completed Percentages are in terms of alkaloids

Sample	(A)	(B) Dried Residue	(B) Volatile Portion
1	0 1274%	0 0901%	0 0241%
2	0 1352%	0 0836%	0 0433%

The above results clearly indicate a volatile base

Experiment 3 Experiment 2 was repeated and the final chloroform residue dried at 60° C over a period of 1 hour Percentages are in terms of alkaloids

Sample	(A)	(B) Dried Residue	(B) Volatile Portion
1	0 1352%	0 0665%	0 0125%
2	0 146 %	0 0557%	0 0566%

In order to secure larger quantities of volatile basic material it was necessary to prepare a large Soxhlet apparatus which would extract 400 to 500 Gm of drug A large percolator was fixed so that a continuous extraction could be made A number of samples were assayed according to the hot extraction process and the final chloroform residues dried in the apparatus and the volatile material collected in dilute hydrochloric acid

The hydrochloric acid solution was evaporated to dryness and a small amount of amorphous white powder-like material was obtained having a fishy odor and giving an isonitrile reaction for primary amines It was necessary to combine several fractions before a sufficient quantity of the material for qualitative investigations was obtained

The following investigations were made *1* An organic analysis showed the presence of carbon, hydrogen, nitrogen and chlorine, the last being due, it is assumed, to the hydrochloric acid used, *2*, the white powder gave no definite melting point and the variations of the melting point led us to believe that this was a mixture The material was made basic, extracted with chloroform and the chloroform removed below 0° C A small amount of a volatile liquid was obtained which possessed a strong fishy odor, was basic to litmus and volatilized between 3° and 7° C *3* The qualitative separation for mixtures of amines given by Kamm (10) was used A tertiary amine fraction was obtained whose hydrochloride changed at 185° C and then decomposed at 271–275° A chloroplatinate was made and after recrystallization it decomposed at 240–245° C The result of these determinations led us to classify this material as trimethylamine *4* Attempts were now made to recrystallize the amorphous material from dilute hydro

chloric acid and two types of material resulted, one a silky, needle-like crystal, and the other an amorphous mass The needle-like crystals were carefully collected by mechanical separation and they gave a sharp melting point of 171° C These crystals were made basic and extracted with chloroform, after which they were evaporated below 0° and we again obtained a small amount of liquid having a fishy odor, basic to litmus and volatilizing between 3° and 7° C We believe that this compound is dimethylamine

A further investigation of the presence of bases in the crude drug was made as follows 500 Gm of drug were macerated over night with 1/2 to 1% NaOH solution, then steam distilled and four liters of distillate were collected in dilute hydrochloric acid The distillate was evaporated to a syrupy consistency It became dark brown in color and gave the characteristic odor of the drug The syrupy residue was diluted with distilled water and clarified by the use of charcoal It was then evaporated to dryness and a copious white precipitate was obtained

The precipitate showed the presence of chloride and ammonia and gave an isonitrile reaction Any basic material present was separated from ammonium chloride by extraction with hot absolute alcohol About 0 1 Gm of alcohol-soluble material was obtained The alcohol-insoluble material did not respond to the isonitrile test Further tests proved this to be ammonium chloride The alcohol soluble residue was again treated with hot alcohol in hopes to make a further separation, by fractional precipitation, and a small amount of material was obtained which *gave the isonitrile test* Melting-point determinations were made which were variable showing a slight change at 170°, again at 185° and apparent decomposition at 265° A chloroplatinate was prepared which was apparently only one substance as examined under the microscope This derivative decomposed at 236–242° The remainder of the base was dissolved in water, made basic with ammonia T S and extracted with chloroform which was removed in the cold A small amount of a viscous liquid was obtained which possessed a fishy odor and volatilized at 3° to 7° C , again leading us to believe that trimethylamine was present

Since the W & P extraction process (macerating over night with stronger ammonia water followed by hot extraction) gave much higher yields of basic material than were secured in the U S P X method and since a mixture of amines was obtained in these residues, we were led to believe that these amines might be due to decomposition of some basic material during the assay process The presence of trimethylamine is not uncommon in those plants containing choline as a constituent According to Kunz (8), Tschirch (9) and Pictet and Biddle (11), choline has been found in *Hyoscyamus niger* We tested the drug for the presence of choline by the process outlined by Kunz (8) for the isolation of choline from extracts of Belladonna

We isolated a product, by this procedure, which gave the following reactions A precipitate was obtained with Mayer's reagent which melted at 110° A chloroplatinate was prepared which decomposed at 240–242° C The material was treated with moist silver oxide and a distinct trimethylamine odor was obtained These same tests were performed upon known choline hydrochloride obtained from Eastman Kodak Company and the results checked those which we had obtained upon our product We therefore believe that this verifies the presence of choline in *Hyoscyamus niger* as reported by Kunz and others

The decomposition products of choline are usually given as trimethylamine and glycol This led us to treat known choline hydrochloride by the hot extraction process given previously The final chloroformic extract was divided into two equal parts The first was evaporated to about 2 cc , placed in the drying apparatus and warm dry air passed over it for an hour, and the air passed through a weak hydrochloric acid solution This hydrochloric acid solution gave tests for trimethylamine and a faint isonitrile reaction The second portion was evaporated to low volume, standard acid added, chloroform removed by evaporation and excess acid titrated using $N/50$ NaOH A basic material was definitely indicated

SUMMARY AND CONCLUSIONS

1 The alkaloids of Hyoscyamus are much more stable than they are usually assumed to be When chloroform solutions of them are evaporated they can be heated at the temperature of the water-bath one or two hours without decomposition

2 The hot extraction process recommended to the Revision Committee gives much too high results because of the fact that volatile bases other than alkaloids are extracted and assayed as alkaloids In a smaller measure the same is true with the U S P X process

3 The presence of choline in Hyoscyamus has been reaffirmed

4 The discrepancy between the results of the hot extraction process and the U S P X process of assay is presumably explained by the fact that the former because of the presence of stronger ammonia water and heat decomposes more of the plant choline

5 Trimethylamine and a primary amine were found in the residues secured by the hot extraction process

6 Indications of the presence of dimethyl were obtained but not confirmed

7 Any assay process for Hyoscyamus must take into consideration the elimination of volatile bases, other than alkaloids, that may be extracted

We recommend the following assay process

Place 25 Gm of Hyoscyamus in No 60 powder in a thimble, place the thimble in a Soxhlet extractor and moisten with a mixture of 8 cc of stronger ammonia water, 10 cc of alcohol and 20 cc of ether, mix thoroughly, macerate over night, then extract for not less than 3 hours on a water-bath using ether as a solvent Evaporate the extractive to about 15 cc and then add 10 cc of approximately $N/10$ sulphuric acid and 10 cc of water Continue the evaporation until the ether is removed Filter into a separatory funnel, dissolve the chlorophyll residue in chloroform, add acidulated water and evaporate until the chloroform is removed and filter into the funnel through the same filter paper Make the filtrate basic with ammonia T S and extract the alkaloids by "shaking out" with chloroform Test for complete extraction of alkaloids Evaporate or distil the chloroform to low volume, then evaporate to dryness on a water-bath and keep at this temperature for 15 minutes Dissolve the residue in chloroform, evaporate to dryness on the water-bath and continue the heating for 15 minutes Repeat this for the third time Take up the residue in chloroform, add 15 cc of fiftieth normal sulphuric acid, remove the chloroform by evaporation and titrate the excess acid with fiftieth normal base using methyl red as indicator

ISOLATION AND IDENTIFICATION OF SUCROSE FROM SENEGA *[1]

BY RALPH BIENFANG

As early as 1836, Price made mention of a sugar-like substance which he noticed in an extract of senega In 1894 Guillaume-Gentil reported that he obtained a carbohydrate, polygalite, using a method projected by Chodat in obtaining it from the root of Polygala amara Characters for this substance given by Guillaume-Gentil were, melting point 138°, easily soluble in water, hot alcohol and practically insoluble in ether Fehling's solution had no immediate effect upon an aqueous solution of it, but after 24 hours, a red sediment was noticed in the bottom of the tube In 1896, Schroeder in this country reported the presence of 5 82% of sucrose, and in 1896 Kain in Germany likewise reported sucrose as a constituent of senega

Seven Kg of senega in a No 20 powder were first extracted with petroleum ether and then with alcohol The alcoholic extracts were turbid, and so were filtered before being concentrated The concentrated alcoholic extract was put into glass containers and allowed to stand at room temperature for two weeks At the end of this time an appreciable crystalline deposit had formed on the sides and bottoms of the containers This was broken up, filtered out, redissolved in diluted alcohol, and shaken with animal charcoal until a colorless syrup was obtained In this syrup, upon standing, crystalline blocks were formed These crystals obtained were sweet and so some of the material was tested with the Molisch reagent for carbohydrates The result was positive With Fehling's solution a negative result was obtained The crystals were soluble in water and hot alcohol, but insoluble in cold alcohol and ether The melting point was found to be 186–187° C , specific gravity 1 5734 at 20° C A specific rotation of +67 5° became −20 4° after boiling with HCl An acetate was attempted with the production of a bitter syrup insoluble in water but soluble in alcohol Glucosazone was formed when it was heated for 46 minutes with phenylhydrazine hydrochloride and sodium acetate

* Scientific Section, A Ph A Madison meeting, 1933

[1] From a thesis submitted in partial fulfilment of the requirements for the Ph D degree University of Wisconsin, 1929

Since the above characters of the isolated material agree with those recorded for sucrose, the material was concluded to be sucrose

PSYLLIUM SEED II SO-CALLED "ADEX PSYLLIUM"*

BY HEBER W YOUNGKEN

In a previous article (see JOUR A PH A, 21 (1932), 1265–1271), some studies were reported that had been made by the author on commercial Psyllium seeds Since that time he has examined many commercial samples of Psyllium including the article known as "Adex Psyllium"

Psyllium seed has become a broad commercial synonym for a variety of seeds belonging to the genus *Plantago*, many reputable dealers specifying on their labels the particular commercial variety of Psyllium by limiting adjectives preceding the noun, such as French-, Blonde-, White-, Brown-, Black-, German-, Spanish-, and some have supplemented the common commercial name with the scientific or botanical name of the plant claimed to yield the product

During the course of the author's earlier observations on the commercial Psylliums, he came upon a package labeled 'Adex Psyllium Seed" Upon examination of its contents it proved to consist of the nutlets or fruits of a Labiate, and this product was being offered as a kind of Psyllium seed Later, he received samples of this very article by two dealers who sought his opinion on the quality of "this form of Psyllium seed"

Of course it was not a Psyllium seed at all, not even a seed, but a fruit of the Labiate which Clevenger had previously detected and reported to be yielded by *Lallemantia royleana* (1)

The plant was named after the botanist, Royle, who collected it in the province of Kanaor in India

The author planted several lots of these small fruits in seed boxes and pots and reared several plants therefrom which he compared with the description of *Lallemantia Royleana* Benth in De Candolle s *Prodromus* (2) and found the characteristics of them to tally with the statements on this species in that authoritative work

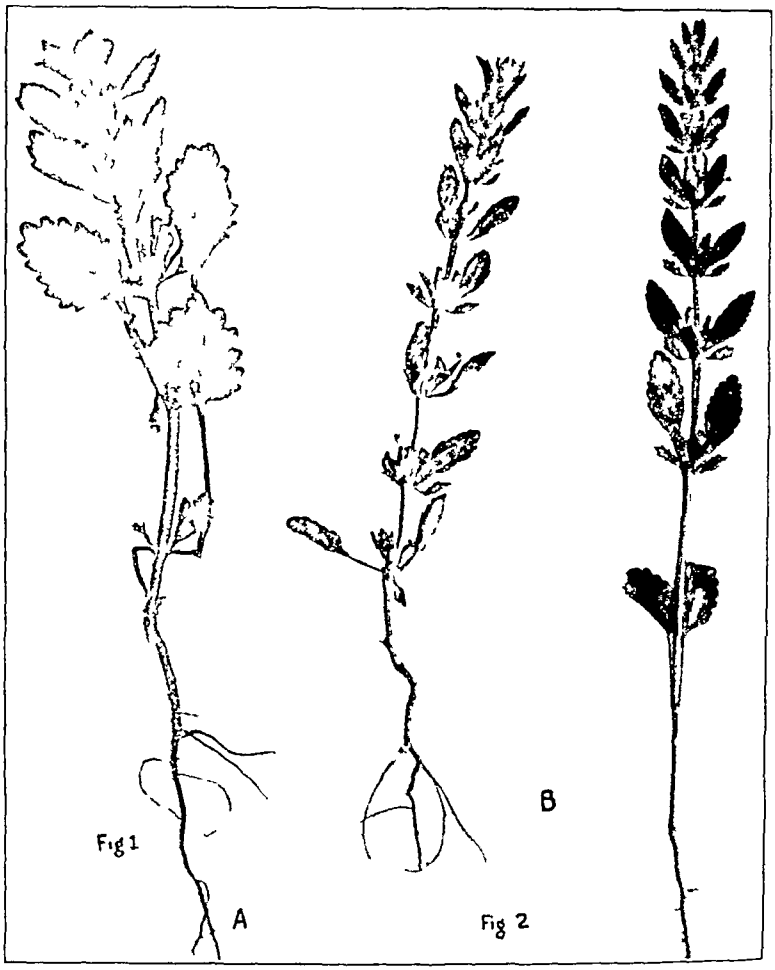
DESCRIPTION OF LALLEMANTIA ROYLEANA BENTHAM

An annual herb native to India and Persia attaining a height of from 5 to 18 inches Stem quadrangular simple to branched glabrate at base softly villose beyond and pubescent at the apex Foliage leaves opposite ± cordate below petiolate, green base of the lower cuneate, of the upper narrowed into petiole margin of lower leaves crenate inflorescence a long interrupted spike like raceme of verticillasters bracts small petiolate flowers small tubular bilabiate the calyx green pubescent 5 toothed and striate the corolla pale purple to blue with a slender tube and a 2 lipped limb fruits 4 dull black oblong ovate nutlets, seed exalbuminous

---

* Scientific Section, Madison meeting, August 1933

Plants grown by the writer from commercial "seed" were in flower in late July They varied from 12 to 30 cm in height The foliage leaves were petiolate, the lower up to 4 cm in length, the lamina cordate, up to 2 cm long and 1 cm broad, the apex obtuse, the base cuneate, margin crenate and surface villose The upper foliage leaves were oblong-ovate, spatulate to lanceolate with mucronate



Figs 1 and 2—Flowering plants of *Lallemantia Royleana* Benth grown from two lots of so called "Adex Psyllium seed "

apex, attenuate base and dentate to serrate margin The bracts were oblong, sharply serrated, the teeth terminating in long, lilac-colored bristles The flowers were tubular-bilabiate, each with a green, slender, tubular calyx 5 to 6 mm long, possessing 15 villose ribs and a lilac to purplish blue, tubular bilabiate corolla

PHYSICAL CHARACTERISTICS OF FRUITS

When examined under a lens the nutlets are oblong ovate dull black to dark brown (immature fruit) with a light brown edge when examined over a surface illuminated from below with a dorsal convex surface and two plane or slightly concave ventral surfaces, the latter sepa

rated by a longitudinal ridge which extends to a cream-colored, elevated, saddle shaped hilum at the narrow end, 3 to 3 5 mm long and 1 to 1 2 mm wide, internally the cut surface showing a narrow black pericarp and a large gray to bluish gray oily seed, odor indistinct, taste sweet and mucilaginous upon mastication

HISTOLOGY OF FRUITS

Cross and surface sections were cut in cork and paraffin and separately examined in water, iodine water phloroglucin-HCl, picric acid and in xylol mounts under a compound microscope A cross section cut through the middle region of the fruit exhibits an irregular, triangular outline with rounded angles, one convex side and two more or less concave sides

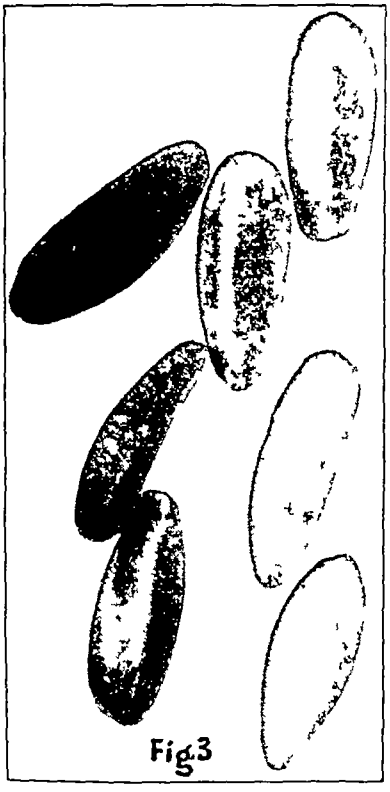


Fig 3 —Fruits of *Lallemantia Royleana* offered on the American market as 'Adex Psyllium" and more recently as a ' Black Plantago Psyllium seed " Photomicrograph × 10

Pericarp —This consists of an epidermis and a brownish black pigment layer The epidermis is mucilaginous, from 21 24 to 32 microns in radial breadth its cells showing prominent thick radial walls outer walls which are thin in the middle and thickened toward the radial walls and thin, inner walls Many of the outer walls appeared missing The radial walls of adjacent cells terminate in shal low saucer or cup shaped structures which give them the appearance of long stemmed goblets or peltate structures The lumina of these epidermal cells are filled with cell content mucilage

When mounts of dry cross sections are irrigated with water, the outer walls of the epidermal cells burst and long laminated finger like processes of mucilage quickly protrude The mucilaginous processes extend from the inner wall of each of the epidermal cells and project outward between the jagged cup like ends of the radial walls for a considerable distance beyond the margin of the section The pigment layer contains dark brown amorphous matter

Seed —Beneath the pericarp and adhering thereto is the seed coat which is composed of outer brown, narrow, palisade cells and inner brown, irregular to stellate cells the latter having long slender processes

The embryo consisting of 2 large fleshy cotyledons and a hypocotyl fills up the large central part of the seed Its small parenchyma cells possess thin walls and contain minute aleurone grains and fixed oil droplets, but no starch

BEHAVIOR OF ENTIRE FRUITS IN WATER

When 1 Gm of the entire fruits was placed in a 50-cc graduated cylinder, water added to the 50-cc mark and the contents agitated at intervals during 24 hours, at the expiration of which time the total volume occupied by the swollen fruits was noted, the final reading showed the swollen fruits occupied a volume up to the 40 cc mark In 48 hours the volume occupied was 47 cc The fruits, enveloped in mucilage, tended to cohere

When entire dried fruits are examined in water under the compound microscope, the epidermis swells, the outer walls burst, liberating numerous finger-like processes of mucilage which later coalesce, forming a bluish tinged mucilage which tends to adhere tenaciously to the fruits Within 24 hours after a fruit has been

macerating in water, the mucilaginous exudate adherent on its outer surface occupied an area of at least six times that of the fruit included within it As noted above in the sections, so also in the entire fruit, the radial walls of the epidermal cells appeared as long-stemmed goblets whose terminal cups frequently showed jagged margins The mucilage at the end of this period appeared as irregular, interrupted, radiating strings

Recently the writer has been informed by a friend at Collegeville, Pa , of a serious case of illness following ingestion of a drug answering the description of this one From the tendency of the fruits to cohere, and from the microscopical studies of the outer fruit wall after maceration in water, as aforementioned, it

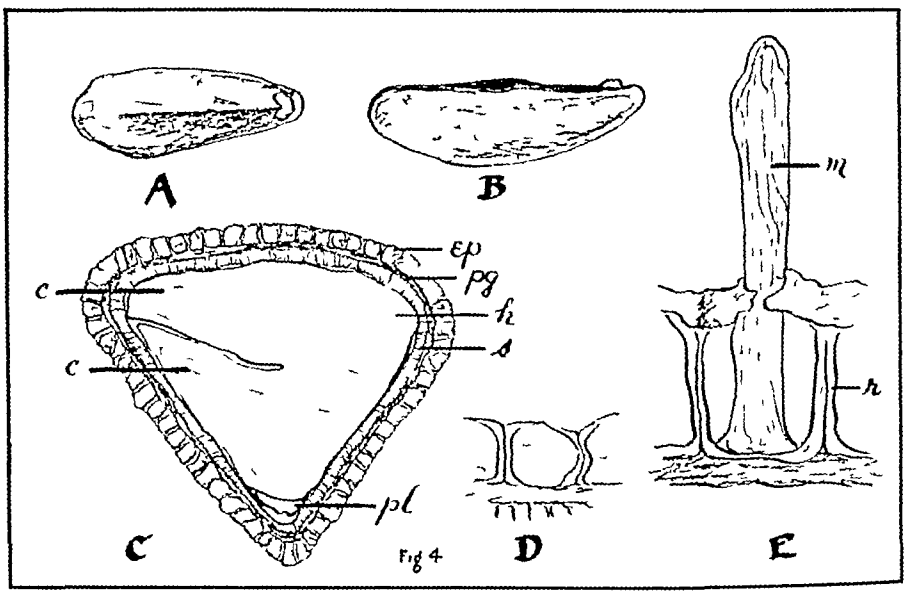

Fig 4

Fig 4 —Fruit of *Lallemantia Royleana*, commercially known as *Adex Psyllium* A, ventral surfaces B, dorsal convex surface and portion of one of the ventral sides C transverse section, showing epidermis (*ep*) and pigment layer (*pg*) of pericarp, seed coat (*s*) cotyledons (*c*) and hypocotyl (*h*) of embryo, and placenta (*pl*) D, a more magnified view of a portion of the epidermis and subjacent tissue in cross section of dry fruit Note mucilage in epidermal cell and radial walls with middle lamellæ E, view of the outer portion of the cross section of the fruit directly after irrigation of mount with water *m* mucilage, *r*, peltate structure formed of radial and outer walls of adjacent epidermal cells

is conceivable how such could follow When taken into the intestine, it is probable that intestinal movements caused formation of a bezoar mass with the rigid, peltate projections of epidermis of the fruits interlocked, occluding the passageway

CONCLUSION

While mucilage of fruits of *Lallemantia Royleana* may be found of some service in the arts, if means for properly separating it can be devised, the writer is of the opinion that the internal administration of this fruit to man or beast is dangerous

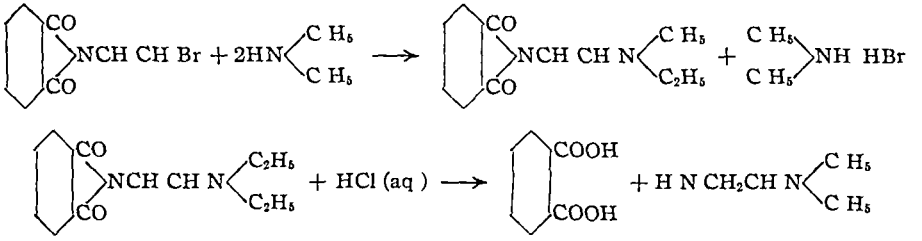
A CONVENIENT LABORATORY METHOD FOR THE PREPARATION OF UNSYMMETRICAL DIETHYL ETHYLENE DIAMINE *

BY W A LOTT AND W G CHRISTIANSEN

The following is a detailed description of a modification of the method described by Ristenpart for the preparation of unsymmetrical diethyl ethylene diamine, it gives good results and is very convenient



Procedure —One hundred and twenty-three Gm of bromethylphthalimide is boiled under a reflux condenser for 12 hours with 70 Gm diethylamine dissolved in 300 cc dry toluene After the first 3 hours' boiling, the diethylamine hydrobromide is removed by filtration before continuing (*Note 1*) After removing the remainder of the diethylamine hydrobromide by filtration, the reflux condenser is replaced by a condenser arranged for downward delivery, and the toluene is removed by distillation The reflux condenser is now returned into place and the residue is boiled for 3 hours with 420 cc of 20% HCl Upon cooling, the phthalic acid is filtered off and leached with warm (not hot) water to recover any product retained by it The solution of the diamine hydrochloride is concentrated in an open dish on the steam-bath until it is a thick, viscous syrup and with good external cooling, the syrup is made strongly alkaline by means of 40% KOH Now 25 cc isopropyl alcohol is added, and then an excess of solid KOH, in small pellets, which causes the appearance of a copious precipitate of potassium chloride The reaction mixture is allowed to settle out in a tall narrow cylinder or centrifuged The isopropyl alcohol solution of the amine is dried carefully over solid KOH and subjected to distillation

Thirty-two Gm or 61% of material boiling at 143–147° C is obtained (*Note 2*) The pure material boils at 145° C

Note —1 About 84% of the theoretical diethylamine hydrobromide is removable after 3 hours About 14% additional is removable after 10 hours, and most of the remaining 2% is removable after 12 hours

2 Practically all of the loss of yield is mechanical loss in separating the amine solution from the KCl and strong potash Further extractions with isopropyl alcohol can be made, but the main product should not be dissolved in a larger volume of alcohol than that specified since much amine boils over with the alcohol, making rectification difficult

Other Methods of Preparation —Ristenpart (*Ber*, 29 (1907), 2526) uses the same reactions, but condenses the diethylamine with the bromethylphthalimide

* Scientific Section, A PH A Madison meeting 1933

in a sealed tube at 100° C without a solvent The method is inconvenient and usually incomplete due to caking of the phthalimide and the amine hydrobromide

It has also been prepared by condensing diethylamino ethyl chloride with potassium phthalimide, followed by acid hydrolysis

STEROL GLUCOSIDES

BY OLE GISVOLD

Whereas a survey of the literature reveals the fact that phytosterols, for the most part, occur as such, it also shows that several sterol glucosides have been reported, the so-called phytosterolins (1) If the amounts of sterols present in plants are small, those of the phytosterolins reported are even smaller Hence the sugars obtained upon hydrolysis have not been identified completely

Under these circumstances it naturally seemed desirable to synthesize sterol glucosides with glucose and other sugars Thus the glucose glucosides of sitosterol and cholesterol were prepared by Salway (2) in 1913, and that of ergosterol by Mac Corquodale (3) in 1930 Having worth-while amounts of several phytosterols on hand, the synthesis of as many of their glucosides as time and material permitted was undertaken

The method of preparation employed was essentially that used by Power and Salway in 1913 in the preparation of the sitosterol and cholesterol glucosides and again by Mac Corquodale in 1930 in the preparation of ergosterol glucoside

The procedure is essentially as follows, with some modification of deacetylation

Two Gm of dry sterol, 3 Gm of pure freshly crystallized tetracetyl bromglucose were dissolved in 100 cc of dry ether and 3 Gm of dry freshly precipitated silver oxide were added The mixture was shaken continuously for 8 hours, centrifuged, filtered and the ether distilled off The residue thus obtained was recrystallized once from 95% alcohol The partially purified product was dissolved in warm absolute alcohol and deacetylated with a solution of freshly prepared sodium ethoxide The insoluble precipitate thus obtained was filtered off and washed twice with small quantities of hot alcohol The crude product thus obtained was recrystallized from a hot saturated solution using a mixture of 95% alcohol and pyridine as a solvent The glucoside crystallized very well and a pure product was thus obtained

Preparation of Aceto Brom Glucose (4)—The procedure employed was that described by Levene and Raymond, and excellent yields were obtained

Dry HBr was passed into acetic anhydride until the latter contained 40 Gm of the gas per 100 Gm of the finished reagent For each 50 Gm of pure anhydrous powdered glucose 250 cc of the reagent were used The glucose was divided into 10 Gm portions, each kept in a stoppered test-tube The reagent was cooled to 10° and the glucose added under constant shaking The temperature was not allowed to exceed 30° The first portion of glucose dissolved quite slowly but the later portions more rapidly Before additional portions were added the solution was cooled to 10° After all the glucose had been added, the solution was cooled to 0° and dry HBr was passed into it until the total content was 60 Gm per 100 Gm of acetic anhydride The solution should be only a light straw color It was permitted to stand for one hour and then concentrated to half its original volume Thirty cc of toluene were added and the distillation continued until the residue became a thick syrup Three additional portions of toluene were added and removed by distillation All reagents were removed as completely

as possible The thick syrup thus obtained was taken up in ether, shaken with charcoal and the mixture filtered To this warm solution petroleum ether was added until the cloudiness obtained just threatened to remain The solution was allowed to cool when the product crystallized readily If the product fails to crystallize, a few seed crystals will readily induce crystallization

Preparation of Dry HBr—10–15 Gm of naphthalene were dissolved in a small quantity of xylene (or high boiling kerosene) and the solution placed in a 500 cc Florence flask The flask was connected by means of a bent glass tube with a Woolff bottle which contained 48% HBr solution with a little red phosphorus in suspension This, in turn, was connected with a U tube containing red phosphorus distributed by means of glass wool The gas was led through a $CaCl_2$ tower and then through two U tubes of P_2O_5 in glass wool The bromine was added to the naphthalene by means of a separatory funnel at a slow rate

Preparation of Dry Ether—The ether was shaken first with a saturated solution of KCl It was then allowed to stand over CaCl for several days and filtered P_2O_5 was added in excess The decanted ether was finally dried with sodium and potassium alloy prepared in the following manner Xylene was heated to 80°–90° in an evaporating dish and the previously cleaned sodium and potassium were placed into it and pressed together with a stiff spatula until a liquid alloy was obtained The ether thus dried was distilled and kept in 100 cc bottles previously dried in an oven at 110°

Preparation of the Silver Oxide—The silver oxide first used was prepared by precipitating equimolecular portions of silver nitrate and sodium hydroxide However, no condensation could be effected even though it was freshly prepared If however, the silver oxide was prepared in the following manner (5), condensation could be effected

A 10% solution of silver nitrate was heated to 86° and added rapidly, with rapid stirring, to a hot 2 3% solution of sodamide The precipitate was washed 5 times by decantation with hot water, then by decantation with 5 parts of absolute alcohol, and filtered by means of suction It was washed once with absolute alcohol dried in the air and then dried over P_2O_5 in a vacuum and used within 48 hours

In order to become acquainted with the technique in effecting condensation, cholesterol and ergosterol were experimented with As was mentioned before in the preparation of the silver oxide, several attempts were made before effecting condensation The elaborate procedure needed to run one experiment required some time However, the technique once mastered, no further difficulty was encountered although the yields were not high

Ergosterol Glucoside—The ergosterol used in this synthesis was obtained from oil of ergot The glucoside was obtained in fine white needles m p 314 5° The melting point recorded by Mac Corquodale was 315°

Stigmasterol Glucoside—The stigmasterol used was obtained from Echinacea It had a melting point of 170° Very fine needles of the glucoside were obtained which melted at 299°

Phytosterol Glucoside—The phytosterol used in this synthesis was obtained from milfoil and melted at 134° The synthesized glucoside was obtained in fine white needles which melted at 293°

Chloresterol Glucoside—The chloresterol used in this experiment was obtained from gall stones and had a melting point of 146° The glucoside was obtained in the form of fine white needles which melted between 280° and 284° The melting point recorded by Salway (2) was 270–285°

THE GRAVIMETRIC AND VOLUMETRIC DETERMINATION OF BRUCINE AND STRYCHNINE AS DICHROMATE *

BY I M KOLTHOFF AND J J LINGANE

Brucine and strychnine salts give crystalline precipitates with alkali dichromates and chromates No use for quantitative purposes has been made of these precipitation reactions In the following, the properties of the alkaloid dichromates are described and a procedure is developed by which brucine and strychnine can be determined quantitatively as dichromates These are much less soluble than the corresponding chromates, the latter not being suitable for quantitative purposes

Materials Used—*Brucine* hydrochloride and *strychnine* sulphate solutions of known concentration[1] were used

Brucine Dichromate—This salt was prepared by precipitation of brucine hydrochloride with a slight excess of potassium dichromate solution The precipitate was washed thoroughly with water, it consisted of very fine crystals (Portion I) Part was recrystallized from hot water in order to obtain larger crystals (Portion II) Both portions were dried in the air

Strychnine Dichromate—Two portions were prepared in a way similar to that described above

Potassium Dichromate—A C P product was thrice recrystallized from water and dried at 200° Standard solutions were prepared by dissolving weighed samples in a known volume of water

Ferrous Ammonium Sulphate—C P Solutions were prepared in 0 5 to 1*N* sulphuric acid and standardized against dichromate

SENSITIVITY OF PRECIPITATION OF BRUCINE AND STRYCHNINE AS DICHROMATE

One cc of 1*N* potassium dichromate was added to 10 cc of the alkaloid solution A 0 004 molar brucine hydrochloride solution gave a crystalline precipitate after 1 minute of standing, 0 002 molar after 5 minutes, 0 001 molar after 15 minutes and 0 0005 molar solution a slight precipitate after 2 hours

The sensitivity of the strychnine precipitation was the same but the precipitate was formed more quickly Thus a 0 0005 molar strychnine solution gave a slight precipitate after 10 minutes of standing According to the above about 2 mg of brucine or strychnine can be detected in 10 cc of solution by the dichromate test

COMPOSITION OF THE PRECIPITATES

Water Content—The samples were kept over deliquescent sodium bromide until constant weight was attained They were then placed in vacuum desiccators

---

* Scientific Section, A PH A, Madison meeting 1933

[1] See THIS JOURNAL April 1934 page 302

over concentrated sulphuric acid or phosphorous pentoxide and kept therein until the weight was constant again Upon continued drying in a vacuum oven at 70° no further loss in weight was noticed The hydration and dehydration process appeared to be completely reversible, indicating that no decomposition had taken place on drying It should be mentioned that brucine dichromate which had attained constant weight over deliquescent sodium bromide lost 0 5 to 0 6% water when placed over deliquescent calcium chloride The strychnine compound lost under the same conditions 0 4 to 0 5% in weight Fairly large crystals of strychnine dichromate after attaining constant weight over deliquescent calcium chloride lost 0 86% in weight on drying in a vacuum at 70° The same crystals after having reached constant weight over deliquescent sodium bromide lost 1 35% in weight The same preparation was ground to a fine powder, the corresponding losses in weight were 0 82% and 1 23%, respectively

Chromium Content —Samples which had attained constant weight over sodium bromide were ignited and weighed as Cr_2O_3 In order to test the purity, the latter was transformed by a sodium peroxide fusion and oxidation with potassium bromate in acid medium to dichromate and later titrated with a standardized iron solution In other portions of the original samples, the dichromate content was determined in a volumetric way as will be described below

Alkaloid Content —Suspensions of the products were made alkaline with sodium hydroxide and the alkaloids shaken out with chloroform The alkaloid content of the chloroform was determined by evaporation to dryness, weighing and titrating in the usual way

The results given in Table I show that the brucine dichromate has the composition $(C_{23}H_{26}N_2O_4)2\ H_2Cr_2O_7\ 5H_2O$, M = 1096 6, and the strychnine dichromate $(C_{21}H_{22}N_2O_2)_2\ H_2Cr_2O_7\ 1H_2O$, M = 904 4 It is possible, however, that the latter product contains only half a molecule of water of crystallization

TABLE I —COMPOSITION OF BRUCINE AND STRYCHNINE DICHROMATE
(After reaching constant weight over deliquescent sodium bromide)

	(Brucine) $H_2Cr_2O_7\ 5H_2O$		(Strychnine)$_2H_2Cr_2O_7\ H_2O$	
	Found %	Calculated %	Found %	Calculated %
Water	7 8	8 2	1 3	2 0
$H_2Cr_2O_7$	19 93	19 88	24 04	24 11
Alkaloid	71 8	71 87	73 7	73 91

SOLUBILITY OF BRUCINE AND STRYCHNINF DICHROMATE

Samples were shaken with various solvents for 24 to 50 hours at room temperature The amount dissolved was determined by making the filtrate ammoniacal and shaking out with chloroform After evaporation of the latter the residue was titrated acidimetrically using methyl red as indicator In the solubility determination in alcohol a known volume of the filtrate was evaporated to dryness and the residue weighed

From the data given in Table II it is evident that the precipitation of brucine and strychnine is quantitative in a medium containing an excess of potassium dichromate amounting to a concentration of 0 05 molar

TABLE II —SOLUBILITY OF BRUCINE AND STRYCHNINE DICHROMATE (22 ± 2°)

Solvent	Brucine Dichromate Moles p l	Brucine Dichromate $(Bruc)_2H_2Cr_2O_7$ Mg per 100 cc	Strychnine Dichromate Moles p l	Strychnine Dichromate $(Strychn)_2H_2Cr_2O_7$ Mg per 100 cc
Water	0 000605	61 0	0 00050	45 0
0 0017 molar $K_2Cr_2O_7$	0 00020	21 0	0 00020	18 0
0 05 molar K Cr O_7	0 000065	6 5	0 000075	6 8
95% alcohol	0 00076	76 0	0 00069	62 0

GRAVIMETRIC DETERMINATION OF BRUCINE AS DICHROMATE

To 15 to 25 cc of the brucine salt solution containing 100- to 200 mg alkaloid, enough 0 25 molar potassium dichromate is added to make the concentration of the latter about 0 05 molar after the precipitation The precipitate is allowed to stand for at least one hour, filtered on a sintered glass crucible (1G-3) and washed with a saturated solution of brucine dichromate in water This is followed by three washings with 2–3-cc portions of alcohol and a few washings with ether Air is drawn through the crucible for a few minutes and the weighing made after standing in the air for at least 15 to 20 minutes The brucine dichromate $(Brucine)_2H_2Cr_2O_7\ 5H_2O$ contains 71 87% brucine

VOLUMETRIC DETERMINATION OF BRUCINE AS DICHROMATE

If brucine dichromate is dissolved in dilute sulphuric acid (1 to 2*N*), an appreciable oxidation takes place as indicated by the development of a red color of an oxidation product of brucine and the low values obtained in the titration with ferrous sulphate However, if the thoroughly wetted precipitate is dissolved in an excess of an acid ferrous iron solution the loss by oxidation is very small (of the order of 0 5%) The dichromate content of samples which showed constant weight over deliquescent sodium bromide was determined by dissolving a known weight in a standard ferrous ammonium sulphate solution which was 1*N* with respect to sulphuric acid and back titrating with standard dichromate in the presence of phosphoric acid and diphenylamine sulphonate as indicator The results of six determinations were 0 5 to 1% lower than those calculated Blank titrations of ferrous iron in the presence of brucine showed that the dichromate-iron reaction induces a slight oxidation of brucine by dichromate Thus it was found that in the titration of 250 cc 0 01*N* ferrous sulphate in 1 5*N* sulphuric acid in the presence of 160 mg brucine and 10 cc 25% phosphoric acid the error amounted to only 0 5 to 0 6%

PROCEDURE FOR THE VOLUMETRIC DETERMINATION OF BRUCINE

The washed precipitate as obtained in the gravimetric procedure is dissolved in an excess of a ferrous iron solution by adding 25 to 50 cc 0 1*N* ferrous ammonium sulphate in 1*N* sulphuric acid to the precipitate in the crucible and receiving the filtrate in an Erlenmeyer flask The crucible is washed thoroughly with 1 to 2*N* sulphuric acid and the excess iron in the combined filtrates titrated with 0 1*N* dichromate after addition of 10 cc 25% phosphoric acid and 10 drops of 0 2% diphenylamine sulphonate as indicator One cc 0 1*N* ferrous sulphate corresponds to 13 14 mg of brucine

The results of gravimetric and volumetric brucine determinations carried out under different conditions are given in Table III It is seen that both pro

cedures give corresponding results If the initial volume at the beginning of the precipitation is about 25 cc , the results are about 0 3% low, at a volume of 50 cc , 1 2%, and a volume of 100 cc , 2 2%

TABLE III —GRAVIMETRIC AND VOLUMETRIC DETERMINATION OF BRUCINE

(0 1585 Gm brucine taken in all experiments)

[a] Solution was 0 01*N* in hydrochloric acid
[b] Solution was 0 02*N* in hydrochloric acid
[c] Solution was 0 04*N* in hydrochloric acid

If the air-dried precipitates were kept over deliquescent sodium bromide until constant weight was reached, the results of the gravimetric determinations were about 0 5% higher than those reported It is not recommended to dry the precipitates in an oven at 100° to 110° since part decomposes on removing the water of crystallization at this temperature

The last three examples in the table show that the precipitations can be made from very dilute hydrochloric acid At higher acidities (*e g* , 0 1*N* HCl) than those given, part of the brucine is lost by oxidation

GRAVIMETRIC AND VOLUMETRIC DETERMINATION OF STRYCHNINE

The determinations are carried out in exactly the same way as described for brucine, except that after washing with a saturated solution of the precipitate in water, the washing is continued with a saturated solution of the salt in 95% alcohol instead of with pure 95% alcohol If the latter is used, the precipitate shows a tendency to become colloidal and part of it runs through the filter This difficulty is obviated by washing with a saturated solution of strychnine dichromate in alcohol

It may be mentioned that the presence of strychnine is without influence upon the titration of ferrous iron with dichromate Some of the results of the strychnine determinations are given in Table IV The air-dried precipitate $(Strychnine)_2$-$H_2Cr_2O_7$ 1 H_2O contains 73 91% strychnine One cc 0 1*N* ferrous sulphate corresponds to 11 14 mg of strychnine

TABLE IV —GRAVIMETRIC AND VOLUMETRIC DETERMINATION OF STRYCHNINE
(0 1066 Gm strychnine taken)

Total Volume Cc	Concentration $K_2Cr_2O_7$ in Excess Molar	Time of Standing before Filtration Hours	Weight Ppt Gm	0 1N Fe^{++} Used Cc	Strychnine Grav Gm	Found Vol Gm	Error Grav %	Error Vol %

[a] 0 2665 Gm strychnine taken

In the first three experiments the concentration of the strychnine was 0 012 molar, in the next two, 0 006 molar, and in the last one, 0 003 It is evident that the determination gives results accurate to within 1% if the concentration of the strychnine salt is greater than 0 01 molar

SUMMARY

1 Brucine salts yield a precipitate with potassium dichromate, which after drying over deliquescent sodium bromide has the composition $(C_{23}H_{26}N_2O_4)_2 \cdot H_2Cr_2O_7 \cdot 5\ H_2O$ Strychnine dichromate prepared under the same conditions has the composition $(C_{21}H_{22}N_2O_2)_2\ H_2Cr_2O_7\ 1\ H_2O$

2 Gravimetric and volumetric procedures are described for the quantitative determination of brucine and strychnine as dichromates

MINNEAPOLIS, MINNESOTA

THE MICRO-PROJECTOR *

BY S H OSWALD AND L K DARBAKER

Projection of the microscopic slides is fundamentally the same as projection of transparent slides with the magic lantern, or of films with the moving-picture machine The machines all have the same essential parts and differ only in their construction, being altered according to the condition under which they are to be used and the purpose for which they are intended In micro-projection, on account of the small aperture of the lens and the very short focal distance, all these parts must be as nearly perfect as possible and must be assembled with the greatest care The modern projection microscope is of comparatively recent origin

In early times the lack of proper lenses and adequate light supply hindered the development of all projection apparatus and especially the micro projector It is not known who first discovered the phenomenon of projection Aristotle and Euclid mention the use of the principle in their writings, and Arabian works from the eleventh century give a description of the "camera obscura," the forerunner

* Scientific Section, A PH A Madison meeting 1933

of the modern projection machines Until the year 1568, no lenses were used in these projectors, mirrors and pin-hole apertures were used with the sun as the only source of light About that time, Daniel Barbaro used a convex spectacle-lens to increase the brilliance of the image After this discovery, great strides were taken in the field, but the first workable magic lantern was produced by Walgensten, a Danish scientist in 1665 His machine was a crude contraption A naked flame from a smoky oil lamp furnished the light, a single lens answered the purpose of both condenser and projection lenses, and the demonstration was in an absolutely dark room only a few feet square The small room was necessary because the projector had to be outside the room, and its range was very short The spectators stood inside a large camera and viewed the image exactly as it would be recorded on a modern camera plate, in most cases inverted, for the practice of inverting the slide in the machine had not then become popular

In the early part of the 17th century, a number of scientists worked simultaneously but most credit must be given to Kepler for the development of the micro-projector His work was chiefly with lenses, and in 1611 he published a treatise which set forth the value of using additional lenses in projection and advanced many theories which are applied to-day While this short historical summary has been of the development of the magic lantern, it becomes also the history of the micro-projector which is simply a magic lantern with a relatively short projection objective Its scope begins where that of the magic lantern ends and includes the very smallest of microscopic objects One machine cannot be expected to cover the whole range, but the possibilities and value of the micro-projector to the teacher or lecturer are apparent With a large screen image of the microscopic field, the teacher is able to show to a large group the important points of the specimen and point out peculiarities of structure and form He can easily indicate the special points which, though less striking, are often most important In this way, the need for individual help to those learning to use the microscope is eliminated, and more time is gained for study of the object

Although there are many micro-projectors on the market to-day, there are several reasons why it is advantageous to build rather than to buy a machine The first of these is the cost factor In spite of the fact that most manufacturers have reduced their retail price recently, it is possible to build a micro-projector for about half the cost of the lowest priced instruments Many of the parts can be made or assembled from discarded material, and the few parts that must be purchased are very reasonably priced since the cost of assembling is eliminated Another advantage is that the machine can be constructed to meet the requirements of specific conditions under which it will be used The commercial machines are all made to operate perfectly in certain definitely stated conditions, and if these conditions are changed, as they are almost certain to be, the efficiency of the micro-projector is reduced In building a micro-projector the conditions become the constant factor, and construction is altered accordingly

There are comparatively few parts needed for an efficient micro-projector, but those used must be of good quality and adapted to the type of machine that is to be built The light must be the most brilliant possible, the condenser lens must be of clear white glass and should be corrected for chromatic and spherical aberration The mirrors and objective lens should be as nearly perfect as can be ob-

tained The stage for supporting the slide may be as simple or complex as desired, but, for ease of operation, a mechanical stage of some kind should be used An efficient water cell for cooling the light rays is also necessary to prevent damage to the specimen and apparatus These are the essential parts and, if assembled carefully, are all that are needed These can all be modified in many ways to make operation easier and results more certain A very important factor to be considered is the room and screen for the demonstration The room should be absolutely dark, even a small ray of light striking the screen will lessen the brilliance of the image The screen must be of the best, but, as most screens in common use will give satisfactory results, this subject requires no discussion It may be stated that a pure white, entirely opaque screen has been found best

Probably the most important part of the micro-projector is the source of light, for with a poor light the most perfect of machines cannot be satisfactory In passing through the various units, a portion of the light is absorbed by each, with the result that less than ten per cent of the light produced ever reaches the screen This necessitates the use of a very powerful light if the image is to be brilliant at any great distance From early times various light sources have been used, the first being sunlight which remains the most brilliant of all Since it is seldom convenient to use sunlight for projection, other lights were invented and developed for use in its stead From the naked flame of the animal and vegetable oils developed the kerosene lamp with a glass chimney With the discovery of electricity came many types of electric lights, the first of which was the arc light, and, though many types of incandescent lamps have been produced and are used to day, it is next to sunlight, the most brilliant of all The carbon arc lamp is the best suited for micro-projection, although recently several concentrated filament bulbs have been produced which are more convenient to operate and give good results under limited conditions Of all the arc lamps, the one with the carbons at right angles has been found to be best for micro-projection The reason is that the crater of the horizontal carbon produces a brilliant light in a concentrated area, which can be kept constantly in the axis of projection This condition is very important where a variation of a fraction of an inch might throw the light completely outside the small opening of the objective The light used in the machine about to be described, was an automatic carbon arc lamp with carbons, six to eight millimeters in diameter at right angles, and operated on a current of four to ten amperes It was manufactured by the Bausch and Lomb Optical Co of Rochester, N Y, and gave splendid results on direct or alternating current

THE RHEOSTAT

With any arc light, a rheostat or resistance is necessary to regulate the amount of current and prevent overloading of the circuit when the carbons are brought together This rheostat may be of the variable type, which permits adjustment of the current without interruption, or of the fixed type, which gives satisfactory results if the current is fairly constant The amount of resistance to use is determined by the current required by the arc lamp A constant current of the correct amperage must be supplied if a steady, brilliant light is to be expected If possible, this unit should be purchased with the arc lamp, although a good resistance can be made from iron, German silver or nichrome wire of the correct diameter and length

The mounting can be made on any non-inflammable non-conductor Some provision should be made for conducting away the heat formed, such as the free circulation of air or immersion in water The resistance for the light mentioned above was constructed of coiled nichrome wire, wound on grooved porcelain, which also aided in conducting away the heat A fuse plug or other circuit breaker, on or near the machine, is necessary to prevent damage to the wiring system in case of accident The fuse should be of slightly lower capacity than those of the lighting system so it will be the one to burn out as the result of an overload

THE CONDENSING LENS

The next unit to be considered in the construction of a micro-projector is the condensing lens As its name suggests, the purpose of this lens is to condense or converge the rays of light to a point This is necessary in order to concentrate as much of the light as possible on the specimen at a certain point so that most of it will enter the opening of the objective This condensing lens may be composed of one, two or three elements Those of one element are rarely used because of their very long focal distance Those with three elements have proven best for micro-projection because the focal distance is convenient, and they are entirely free from chromatic aberration The two element lens, although of slightly longer focal distance and more liable to chromatic aberration, has been used successfully in many cases This type was used in the foregoing experiments, because it was less expensive and absorbed less light than the three-element condenser A slight spectrum was produced but was entirely eliminated by careful adjustment of the substage mirror

THE COOLING CELL

Another important part of the micro-projector which should be considered with the light and condenser is the water-cooling cell This is a necessity because a great deal of heat is produced by the arc lamp, and both the light and the heat are brought to a point by the lens and concentrated in a small area This heat would quickly destroy any inflammable substance placed in the point of focus, which is the position of the slide to be projected The water cell, when placed in the path of light, absorbs a large part of the heat but permits most of the visible light rays to pass through The cell is very simple of construction, consisting essentially of a narrow glass cell with parallel sides, filled with water It may be from one to ten centimeters thick, but more than five centimeters is rarely necessary and should not be used, since more light is absorbed by thicker layers of water A cell one centimeter thick will absorb about seventy per cent of the heat and usually prevent serious damage when used with the ordinary small arc lamp Good results were obtained with a cell one and a half centimeters thick, constructed of ordinary window glass mounted in a ring of tinned sheet iron and made water-proof with aquarium cement No other substance was added to the water except a trace of copper sulphate to prevent the growth of algæ and molds

PROJECTION

These parts mentioned may all be considered as units of the light source for they all aid directly in producing the light and making it suitable for use in projec-

tion The remaining parts are those for utilizing the light to project the image The most important of these is the microscope or microscope objective which is also the projection lens An ordinary microscope can be used and will give good results in some cases, but, for the best results, the microscope should be modified to adapt it for its position in the machine The narrow barrel should be replaced by one of larger diameter, and such mirrors and extra lenses added as necessary for conditions under which the machine is to be used By describing the modifications of the microscope used, these changes can be pointed out In the first place it was found that the eyepiece of the microscope absorbed much of the light and diffused the image to such an extent that the light would not reach the screen from any great distance The eyepiece was discarded, and it was possible to pro ject a concentrated beam which produced a sharp image at a distance of thirty feet, but the field was small The area was increased by using a tube of larger diameter, but best results were obtained by removing the barrel entirely and using only the objective It was desired that the microscope be in its natural vertical position so that the stage be horizontal for showing water mounts, glycerin mounts or living specimens This made it necessary to use a mirror below the stage to reflect the light from the arc lamp up through the slide and the objective For this purpose the regular plane sub-stage mirror was used, and was brought into posi tion by moving the microscope The correct height was attained by placing the microscope on a platform This mirror was adjusted at an angle of forty-five de grees from the horizontal so that the reflected beam would be exactly vertical It was also placed a little nearer the light than the exact focal point so that the reflected rays would converge at the stage level rather than at the mirror Another mirror was necessary above the objective to reflect the light beam at right angles in order that it could be focused on the screen Because of its position and function it may be called the projection mirror, just as the last lens in a magic lantern or moving picture machine is called the projection lens At this point the microscope could hardly be identified The stand and base had been left intact, but the barrel had been removed, and a mirror had been mounted above the objective This modified microscope was found to give good results at a distance of thirty feet, but the image was very large and was not brilliant, on account of the diffusion Since the projection stand was over forty feet from the screen, experiments were neces sary to find means of reducing the size of the image and thus increasing the bril liancy After several unsuccessful attempts, it was found that a projecting lens such as those used in magic lanterns, placed immediately in front of the projection mirror, greatly reduced the size of the image and increased the brilliance It was also found that moving the lens nearer to or farther from the projection mirror, de creased or increased the size of the image The lens was mounted on the microscope so that it moved with the objective and was always in the same relation to it A rack and pinion adjustment in the mounting of the lens, permitted easy adjust ment of image size

The parts mentioned are all necessary if efficient projection and ease of opera tion are to be obtained, and, on account of the number of times the light is re flected, all should be the best of their kind so that no more light is lost than is abso lutely unavoidable The assembling of these parts is also of prime importance All parts must be mounted in the proper relation to the other parts, if the most good

is to be obtained from the parts selected The machine must be entirely light-proof so that only the light which has passed through the projection microscope will reach the screen The center of the arc must be exactly in line with the center of the condenser lens and the sub-stage mirror, which, in turn, must have its center in line with the objective opening The first step is housing the arc lamp Since there are a number of satisfactory methods for doing this, no discussion is necessary, a satisfactory housing can be made from sheet iron or tinned sheet iron and will give good service The next step is to determine the optical axis and to devise a means of keeping the parts in the axis while being adjusted to their correct position For the purpose a track of brass rods or wooden molding can be used to good advantage

In the machine built in this experiment the lamp housing was made of tinned sheet iron An aperture large enough to accommodate the condenser lens was provided in one end, and the light mounted inside at such a distance that the focal point was about eight inches The water cell was mounted between the light and the condenser This unit of arc light, condenser and water-cell was mounted on a wooden base board, large enough to allow room for mounting the microscope in front, and the resistance unit, fuse plug and switch behind, the source of light The microscope was attached to the stand to elevate the substage mirror into the axis of projection This was mounted on the base board, the final adjustments being made with the light burning to insure exact centering It was placed so that the sub-stage mirror was nearer the condenser than the focal point This position caused the light to come to a point just at the stage and obviated the use of a sub-stage condenser A support for the projection mirror and projection lens was made to bolt to the frame of the microscope The mirror was attached to the support by a ball and socket joint, and the lens by a rack and pinion adjustment A vertical shield of wood was placed in front of the microscope to prevent any stray light from reaching the screen, and the entire machine was painted black to prevent reflection When completed the machine was small and compact enough to be easily carried, and was simple to operate, it being only necessary to connect the cord to a light socket, start the arc lamp and place a slide on the stage Focusing was accomplished by the regular coarse adjustment of the microscope No adjustment of the projection lens was necessary except to increase or decrease the size of the screen image

In a trial demonstration slides of plant sections and microscopic animals were projected from a distance of fifty feet The images were clear and brilliant and showed plainly the structure and points of interest Its practicability has not yet been completely determined but indications are that it will be an aid in teaching all branches of microscopy, microbiology and histology

THE MICROSCOPICAL LABORATORIES
PITTSBURGH COLLEGE OF PHARMACY

The Water of Crystallization of Quinine Sulphate ' by H Wales —Scientific Section

Drying a product in an oven shows the amount of water present but does not prove that it is present as a hydrate Vapor pressure measurements on quinine sulphate show that it crystallizes from water at room temperature as the octohydrate Upon drying this passes directly to a dihydrate No evidence of the existence of a heptahydrate was obtained

PHYSICS IN PHARMACY

BY JOHN URI LLOYD, WOLFGANG OSTWALD AND HANS ERBRING

(*Concluded from page 331, April issue*)

II The *Second Divisional Effect* (cf *Fig 16, II*) is characterized, first, by a striking constancy of the height of rise, resp , the difference of level The system is apparently in hydrostatic equilibrium Nevertheless, considerable changes are taking place in it, as shown in *B*, *C* and *D* The hydrostatically repressed salt solution moves upward again, as is seen by the migration of the zone of diffusion (Cf *B* and *C*) Simultaneously with this return motion an increasing difference of weight must arise again (cf *Fig 16, II-B*)

No doubt *diffusion* is responsible for this movement of the salt in opposite direction, which becomes apparent to the eye by the formation of a gradient of concentration The zone between colored salt solution and water is no longer relatively sharp, but spreads out The transition becomes the more gradual the longer the duration of this divisional effect

Now the fact is very striking that difference of level is not noticeably changed, in spite of the diffusion and in spite of the increase of weight of the salt liquid as a consequence of this diffusion If hydrostatics alone were responsible, this fact would be incomprehensible Hence we must look for forces which eventually act independently in opposite direction to hydrostatics, and which therefore may be able to compensate the hydrostatic pressure in the second divisional effect

In this connection we may think first of *kinetic* factors As stated before, the equalization of hydrostatic pressure in filter paper consumes much time We may imagine that in the 2nd divisional effect the process of diffusion takes place faster than the hydrostatic equalization Retardation of the hydrodynamic velocity of water by the capillary spaces of the filter paper is probably much greater (in conformity with Hagen-Poiseuille's law) than the retardation of diffusion by capillary walls Therefore the constancy of the difference of level, notwithstanding the formation of a new hydrostatic disequilibrium by diffusion, could be explained by the great differences in diffusion velocity, and hydrodynamic velocity of the water In this sense, the constancy of the difference of level would be merely a phenomenon of retardation, as it were, a "hydrostatic supersaturation "

However, the part played by osmotic water attraction discussed before, can not be neglected If the diffusing molecules in a capillary system are able to attract solvent in the manner described, they must also carry this osmotically bound water along with them in diffusion Such carrying of osmotically attracted water would indeed be able to counteract the hydrostatic equalization of level The water carried osmotically from left to right would therefore be approximately equal to the water which would be carried hydrostatically from right to left through increase of weight of the salt tube We have two opposite water movements Osmotic carriage of water from left to right, and hydrostatic movement of water from right to left, which about compensate each other in the second divisional effect, the water is thus virtually "immobilized " An osmotic carriage of water would then furnish the theoretically required pressure opposite the hydrostatic pressure, and at the

same time would explain the constancy of the difference of level during the 2nd divisional effect notwithstanding diffusion progressing

III The *Third Divisional Effect* is characterized by slow disappearance of the difference of level, *i e*, by a *reversion* of the direction of liquid movement, while the zone of diffusion migrates into the left tube and there is simultaneous decrease of the difference of weights of the two liquid cylinders in the siphon tubes (cf *Fig 5-III*) In this part of the process, diffusion is the sole driving force Through diffusion the salt is transferred into the water vessel, diminishing thereby, visibly, more and more the differences of weight, resp , the hydrostatic difference of pressure which still existed in the 2nd part of the process

With progressive diffusion a moment will be reached where the difference of weights between the 2 liquid cylinders in the siphon is zero, and then will attain a negative value The longer water cylinder, containing but little salt, will become heavier than the short salt cylinder, which, however, is richer in salt Thus a decrease of the difference of level and gradual equalization can take place hydrostatically

However, it is very striking to note how exceedingly slowly and gradually this hydrostatic equalization takes place Even after weeks of experimentation, in the course of which large quantities of dissolved salt could be demonstrated in the water vessel, complete equalization of level had never been reached This retardation again may be caused by either kinetic factors (hydrostatics in arrear toward diffusion), or the capillary-osmotic fixation of water in the strip of filter paper, the function of this fixation we were able to recognize very distinctly in the 2nd divisional effect When hydrostatic current and diffusion have motions in the same direction, in this case also will water be retained or osmotically immobilized in the filter paper in conformity with the ideas developed before Similarly, water contained in salt-free filter paper shows, as is well known, depression of freezing point, compared with water in bulk

REVIEW

The theory of the Effect may be briefly outlined in the following summary We accept three kinds of forces to share in the phenomenon Primary hydrostatic forces, secondary hydrostatic forces in consequence of diffusion, and capillary-osmotic forces, which may act in opposition to hydrostatic forces The first main rise is principally a hydrostatic effect (Capillary siphon) The hydrostatic and osmotic effects of diffusion have only a secondary share (Diffusion siphon effect and capillary osmosis)

The Second Division, characterized by the constancy of the difference of level in spite of pronounced diffusion, leads us to assume a manifestation of capillary osmosis The hydrostatic excess pressure caused by diffusion, is not visibly balanced because the salt molecules contained in the capillary spaces osmotically attract and immobilize water molecules In the Second Division, this capillary-osmotic attraction of water compensates the hydrostatic excess pressure caused by diffusion

In the Third Division, salt gradually passes over into the (longer) water tube of the siphon, rendering this liquid heavier until the sign of the hydrostatic difference of pressure reverses, and the difference of level again begins to disappear The exceeding slowness with which this equalization takes place, notwithstanding a

strong passage of salt into the water tube, is again ascribed to capillary osmotic immobilization of water in the filter paper

Reviewing again the experimental details recorded in the second part of this work, from the point of view of the theory stated, we find them in agreement with theory The greater length of the capillary connecting tube favors the siphon effect (on account of the longer, heavier cylinder of salt solution) In addition, the capillary-osmotic forces have a more telling effect in a longer horizontal connecting tube The influence of the nature of the filter paper, especially its content of capil lary spaces upon tangential "irrigation" of the paper, seems to argue with especial force in favor of not only hydrostatic but also capillary-osmotic forces in producing the Effect For aside from the velocity of flow, a change in the cross section of a purely hydrostatic siphon does not change in the least a purely hydrostatic effect. Our experiments with filter paper whose pores are clogged by formation of precipi tates, we interpret in the same sense, also in reference to the researches of F E Bartell, E Manegold and others, on the Osmosis of "permeable cells" The fact that electrolytes as well as non-electrolytes show the Effect which becomes the more pronounced the higher the concentration of the salt solution agrees with all pro posed divisional explanations

The insignificant positive influence of temperature is somewhat surprising It is true that the densities of salt solution and water are influenced in the same direc tion by increase of temperature, while hydrostatically only the *difference* in density becomes active On the other hand, both fluidity of water and the solution, as well as diffusion velocity, are materially increased with rising temperature, not so, however, the osmotic pressure which, as we know, increases by only 1/273 per degree

Simple as the Effect appears to be, its dynamics is very involved, as the preceding Analysis demonstrates For the further investigation of these peculiar liquid move ments in capillary systems, such experimental arrangements particularly suggest themselves, in which the hydrostatic effects are eliminated as much as possible For example, a horizontally placed and linearly extended capillary system of the same order might be such an arrangement Although such an experiment seems very simple, it is by no means carried out as easily, as experiments of our own in this respect have already shown Influences of gravity are very difficult to elimi nate, even with horizontal arrangement, and an exact leveling in the case before us is not simple We shall report on experiments of this kind in a later communica tion

SUMMARY

1 When two cylinders which are filled, resp , with concentrated salt solution and water, are connected by a strip of filter paper and the liquid is protected against evaporation, there will be a transfer of water into the salt solution This experi ment described by the senior author about 35 years ago, was again studied in detail, also quantitatively

2 The Effect was easily reproduced There are increases of level, *e g* , up to about 12 mm , and total differences of level to about 28 mm It is further noted that within long periods of time (8 days or more), a maximum effect is reached, thereafter, the difference of level again decreases

3 From a great number of numerical data, the following are presented

(*a*) The Effect strongly increases with increasing length of the capillary connecting piece, *viz*, the strip of paper

(*b*) Previously wetting the paper with the solution likewise causes a strong increase of the Effect

(*c*) It is not the transversal fineness of the pores of the paper, but rather the *longitudinal capillary, i e*, highly developed fibrillary structure of the paper which gives the maximum effects, soft, absorbent paper acts better than hardened, dense paper Improvement is also attained by reducing the diameters of the capillary tubes by partially filling the spaces with highly dispersed precipitates, *e g*, $BaSO_4$

(*d*) The Effect is obtained not only with electrolytes ($FeCl_3$, $AlCl_3$, $BaCl_2$, KCl), but also with non electrolytes (Sugar, Urea)

(*e*) The Effect increases parallel with concentration, initially it increases with good approximation linearly with concentration In the case of Urea, the concentration curves of increases of level are curved faintly convex toward the concentration axis, which is in accord with the concentration curves of osmotic pressure of concentrated molecularly dispersed and colloidal solutions

(*f*) The Effect has a small positive temperature coefficient

4 The problem as to the nature of the driving forces in the observed phenomenon is investigated

It is shown that there are at least three sources of energy sharing in the production of the effect

(1) Hydrostatic forces in capillaries, *Capillary siphon effect*

(2) Diffusion in capillaries *Diffusion-siphon effect*

(3) Osmotic attraction of liquids in capillary systems *Capillary Osmosis*

All three forces come into play

At the beginning of the phenomenon, the *hydrostatic effect* is dominant, then appear *diffusion* and *capillary osmosis*, and toward the end, again *hydrostatics* terminates the process

5 Brief reference is made to the significance of the Effect in geological movements of liquids (subterranean water courses), the theory of swelling, and in biological movements of liquids

ABSTRACT OF A PAPER BEFORE SCIENTIFIC SECTION, A PH A

Chemical Examination of Some Urographic Preparations " by George W Collins

Several years ago Rowntree and his associates demonstrated that following the injection of sodium iodide solution introduced through the ureter radiographic visualization of the pelvis of the kidney, the ureter and the bladder, pyelograms could be made Subsequently, many iodine compounds, both simple and complex have been prepared and tested for their roentgenologic usefulness The author reports the findings of chemical examinations of two different specimens of Iopax, also the examination of a third specimen of the product by a disinterested consulting laboratory Several points of interest are brought forth in the investigation including petrographic data confirming the chemical findings A report is made of an examination of another urographic preparation known as Skiodan Chemically these products differ markedly Iopax is the sodium salt of an acid derivative of an iodized oxo aminopyridine, containing 42 per cent iodine in organic combination, while Skiodan is the sodium salt of *mono iodomethane sulphonic* acid and contains 52 per cent organically combined iodine The evaluation is made of tests and standards for the identity purity and assay of these two preparations In addition there is a resumé of three other iodized products recently introduced and used *in pyelography*

BIBLIOGRAPHY OF PHARMACEUTICAL RESEARCH

Compiled by A G DuMez, Reporter on the Progress of Pharmacy

All articles in these lists will be presented in abstract form in the bound volumes of the Year Book, which is issued annually Those desiring abstracts immediately can obtain them for a fee of one dollar each by communicating with A G DuMez, University of Maryland School of Pharmacy, N W cor Lombard and Greene Sts , Baltimore Maryland

ABSTRACTS OF PAPERS BEFORE SCIENTIFIC SECTION, A PH A

'The Metabolism of Dulcitol and Dulcitan' C Jelleff Carr and John C Krantz, Jr

This investigation has for its purpose the determination of the fate of Dulcitol and its first anhydride Dulcitan in the white rat Liver glycogen and muscle glycogen and respiratory data are included

'The Chemical Assay of Adonis Convallaria and Apocynum," by Margarethe Oakley James C Munch C Jelleff Carr and John C Krantz, Jr

An effort has been made to apply the Knudson-Dresbach chemical method for the determination of the digitalis glucosides to the determination of the glucosides in Adonis, Convallaria and Apocynum

DETERMINATION OF THE REASONABLE OR PERMISSIBLE MARGIN OF ERROR IN DISPENSING II OINTMENTS

BY MARVIN J ANDREWS

(*Concluded from page 356 April* JOURNAL)

VARIATION IN CAPACITY OF OINTMENT JARS PURCHASED FROM MANUFACTURERS

A second series of tests was carried out to determine to what extent jars of the same brand vary in capacity With this object in view, jars labeled 1/2-ounce, 1-ounce and 2-ounce were purchased from four of the leading manufacturers of ointment containers, and these were subjected to the same tests in each case

To obtain the desired data, ten jars were selected at random out of each box of twelve 1/2-, 1- and 2-ounce jars Each of these jars was filled by 10 different students to obtain a fair average for the capacity of the jar Petrolatum was selected as the base for filling, as it is the lightest of any of the four bases used in the tests, and also because it is the easiest to handle It was poured in the melted condition between 43° and 45° C to insure the absence of air-pockets which are always formed when the base is packed in the solid condition The excess was removed by running the edge of a spatula over the top of the jar and wiping off any material adhering to the sides The jars were not weighed until cool

Each of the four manufacturers whose jars were used in these tests was requested to state what standard was used in determining capacity Three replies were received Manufacturer B stated that his standard for capacity was based on the apothecaries liquid measure of 480 minims to the fluidounce It is assumed that the 480 minims refer to distilled water the equivalent of which is 454 6 grams by weight at 25° C Manufacturer C stated that he arrived at his standard for capacity by using the apothecary ounce of 480 grains of petrolatum It is stated further that "a one-ounce rated container will have a fluid capacity of 1 25 ounces" in terms of this standard Manufacturer D stated his standard for capacity was based on the apothecaries ounce of 480 grains of petrolatum

The results of the second series of tests are presented in Table VIII which follows on page 422

The greatest variation in capacity of the 1/ ounce jars of any one make was observed in those obtained from Manufacturer D Jars 3 and 8 of this manufacturer showed a difference of 19 grains, and the S D was 6 55 grains for the ten jars The next greatest variation in capacity was found in the jars obtained from Manufacturer C Jars 7 and 10 of this manufacturer showed a difference of 15 grains and the S D was 4 79 grains for the ten jars

In the case of the one ounce jars the greatest variation in capacity was observed in those obtained from Manufacturer A Jars 2 and 3 of this manufacturer showed a difference of 19 6 grains and the S D was 5 96 grains for the ten jars

In the case of the two ounce jars the greatest variation in capacity was found in those obtained from Manufacturer B Jars 2 and 5 of this manufacturer showed a difference of 30 4 grains and the S D was 10 25 grains for the ten jars

It is an accepted fact that glass containers cannot be made of exactly the same capacity no matter what method of manufacture is followed or how carefully the work is done The limits observed for variations in capacity, however, were surprisingly narrow, being less than 2 per cent for jars made by any one of the different manufacturers, except in the case of the half-ounce jars made by Manufacturer D

1 ounce	10	40%	30%	30%	
2 ounce	10	50%	10%	10%	30%

If, however, jars made by different manufacturers are compared, the variation is so great that reasonable limits are exceeded in most cases For instance, if a comparison is made between jar 7 of Manufacturer A and jar 7 of Manufacturer C, a difference of 72 grains will be observed for the so-called 1/2-ounce jar In the case of the one-ounce jars, there was found to be a difference in capacity of 84 3 grains between jar 2 of Manufacturer A and jar 3 of Manufacturer D With respect to the two-ounce jars, there was found to be a difference in capacity of 259 5 grains between jar 5 of Manufacturer B and jar 5 of Manufacturer D The exceedingly wide variation observed for the capacities of these jars is no doubt due mainly to the difference in the standards used by the manufacturers for determining capacity as already pointed out The remedy for this condition is the adoption of a uniform set of standards for use by all manufacturers

VARIATION IN CAPACITY OF OINTMENT JARS PURCHASED FROM RETAIL PHARMACIES

A third series of tests was carried out to determine to what extent ointment jars used in retail pharmacies in the City of Baltimore varied in capacity With this object in view 1/2-ounce, 1-ounce and 2-ounce jars were purchased from two professional pharmacies, two downtown independent pharmacies, three chain stores and three neighborhood pharmacies, and these were tested for capacity as described under the second series of tests, except that the ten jars of each size were each filled by three different students to obtain a fair average for the capacity of the jar instead of ten students as in the preceding tests Petrolatum was used as the base for filling It was poured in the melted condition between 43° and 45° C so as to eliminate any air-pockets that might be formed in packing the solid base The excess was removed by running the edge of a spatula over the top of the jar and wiping off any material adhering to the sides The jars were not weighed until cool

The results of the third series of tests are presented in Table IX, page 422

On comparing the results of the three series of tests, it will be observed that the standard deviation for the 1/2-, 1- and 2-ounce jars is much higher than that of Series one and two In Series two, jars purchased from manufacturers, and in Series three, jars purchased from retail pharmacies, the standard deviation found for the 1/2-ounce drug store jars was about three times that of the greatest deviation observed for jars obtained directly from the manufacturer The standard deviations in the case of the one- and two-ounce jars are about 7 times as great as those of the highest standard deviation observed in the second series of tests

The greatest difference in capacity of any of the one-half-ounce ointment jars purchased from drug stores was 60 grains, for the one-ounce jars 123 grains, for the two ounce jars, 169 grains

For the purpose of making it possible to more readily compare these results with similar data that have been published, but which have not been expressed in terms of the standard deviation, the per cent of deviation from the theoretical, 480 grains to the ounce, has been calculated and is given in Table X, page 422 It will be observed that the margin of error calculated on this basis is 15 per cent for the one-ounce jars and 20 per cent for the one-half and two ounce jars obtained from the ten stores in Baltimore

CONCLUSIONS

1 Petrolatum was the lightest of the four bases studied, followed in order by a 50 per cent lanolin and petrolatum mixture, lanolin and benzoinated lard when packed as received

2 The frequency and magnitude of error are greater in cases where the base is packed in the solid state, than in those where the filling is accomplished by melting and pouring, except for benzoinated lard

3 The capacity of jars by weight is decreased by triturating the ointment base on a slab previous to packing in the solid state

4 The capacity of jars by weight may be decreased or increased by the incorporation of a liquid or a solid with the base, depending on the nature of the liquid or solid and other factors

5 The percentage of error found was in inverse proportion to the size of the jar

6 Jars of a designated size made by a single manufacturer do not vary in capacity beyond reasonable limits There was observed, however, a great variation in the capacity of jars of a designated size made by different manufacturers The latter variation is due largely to the use of different standards by the manufacturers for fixing capacity To overcome this condition it is suggested that uniform standards for fixing standards be adopted by the manufacturers, and that the material taken as the basis for formulating these standards be petrolatum, because of its comparatively low specific gravity and uniformity with respect to other physical properties

7 The results of the tests show that it is impossible for a glass manufacturer to prepare ointment jars which will hold the same quantities by weight of the different ointments dispensed on physicians prescriptions It is believed, however, that it is possible for them to manufacture ointment jars which will hold within reasonable limits definite quantities of petrolatum or other base selected as a standard The pharmacist will then be able to dispense the full quantity of an ointment with a low specific gravity In the case of ointments with a high specific gravity, the filling of the jar may be done in such a manner as to leave a concave surface, thereby preventing the ointment from coming in contact with the top of the jar, and also satisfying the patient as to the fullness of the jar In the case of very heavy ointments, such as mercurial ointments, it will be necessary to weigh off the quantity prescribed and to dispense it in a jar of the size which it will come nearest to filling

8 With regard to the margin of error which may reasonably be expected in dispensing where jars of the same manufacture are used, our observations point to a figure which at the outside is twice the standard deviation, or 25 per cent, for $^1/_2$- and 1-ounce jars, and twice the standard deviation, or 18 per cent, for 2-ounce jars

(To be continued)

A Note on the Arsenic Determination for Reduced Iron " by Margarethe Oakley and John C Krantz Jr —Abstract of Paper, Scientific Section A PH A

A simplified method of treatment for the preparation of ferrous arsenide in reduced iron for the modified Gutzeit test has been devised

DENTAL DRUGS AND PREPARATIONS—ACCEPTED AND NON-ACCEPTED *

BY GEORGE C SCHICKS [1]

The pharmacist has a definite responsibility when creating a demand for his professional service among men of the dental profession

It may be said, without comment, that the pharmacist's first responsibility should be scientific accuracy in compounding prescriptions So closely correlated with this that it can be considered as part of the same responsibility should be the purity and quality of the drugs used

In order to exercise his professional skill, the pharmacist must create a demand for his services Emphasis must be placed—not on the merchandising of packaged products but on the creation of a demand for official products He must fall in line with the campaigners for dental drugs and preparations official in the U S P and N F That campaign is of sufficient importance to warrant having a paper devoted in its entirety to that subject, and does not come within the scope of this paper

Closely related to the professional integrity which must accompany the pharmacist's scientific skill is his responsibility regarding the sale of packaged products

It has been said that there are very few exceptions to the rule that every patented or proprietary preparation is a modification of drugs and preparations official in the U S P and N F This statement should offer a strong argument for pharmacists urging dentists to use official drugs The prescribing of official drugs by the dentist not only permits the pharmacist to engage in the profession for which he was trained but also allows the dentist individuality in writing his prescriptions However, national advertising by manufacturers of packaged products has made the selection, sale and recommendation of such products an important problem to the pharmacist With such a statement in mind let us consider briefly the case of the patent drug manufacturer

I should like to preface my remarks with the statement that I am not waging a campaign against the honest manufacturer of a non-secret preparation with true claims as to its therapeutic action I mean to strike only at the manufacturer of secret remedies and medications with false claims

Before proceeding I should like to make a few simple distinctions between the terms "patent," "secret," ' nostrum ' and "proprietary" remedies

A "patented" medicine in the legal sense is a medicine whose composition or method of making or both have been patented in the United States Patent office or the office of a foreign country Strictly speaking, a "patented" medicine is not a secret, because its composition must appear in the patent specifications and after seventeen years, when the patent expires, it becomes public property A "patent" medicine—patent without the "ed" is generally considered as any medicine of secret composi-

---

* By the American Dental Association

[1] Assistant Dean Rutgers University College of Pharmacy Newark N J

tion which is advertised directly to the public usually for self-medication A "nostrum" is any patented or secret remedy A "proprietary" remedy, according to the Council on Dental Therapeutics of the American Dental Association, is any chemical, drug or similar preparation used in the treatment of disease if such is pro tected against free competition as to name, product, composition or process of manufacture

If the manufacturer of an article wishes to mark it with a distinctive device or brand, if he has that device trade-marked he is protected against anyone using that trade-mark without his permission so long as he makes general use of the trade-mark himself

A common interpretation of the terms "patent" and "proprietary" is summed up in the statement, "all nostrums advertised and sold directly to the public are referred to as 'patent medicines,' those advertised directly only to physicians and dentists are spoken of as 'proprietaries ' "

A pharmacist should not sell, or offer for sale, preparations, the ingredients of which are not known to the medical profession Secrecy concerning ingredients or false claims made for the therapeutic action of the ingredients should immediately condemn the article In this respect the pharmacist can be a most important factor in housecleaning the drug world of at least some of its cure-all venders and thereby increase both the doctor's and layman's confidence in medicaments in general In this respect the pharmacist should feel a definite responsibility to all persons requiring his services

Advertising has become a tremendously powerful weapon to nostrum manu facturers, $70,000,000 a year are spent by the makers and distributors of such medi cines to promote their use Every conceivable method is used to popularize such medicines I do not mean to infer, however, that all products advertised under this $70,000,000 program do not merit the use by and the recommendation of the medi cal and dental professions or the recognition of the pharmacist—but it must be remembered that national advertising does not necessarily guarantee the worth of a product In fact, the present-day maze of extravagant advertising makes it difficult to determine the true merit of a preparation

The American Dental Association has a Council, similar to that of the American Medical Association, which was organized to determine the worth of various drugs and preparations used in dentistry It organized so that men in the dental pro fession could take guess work out of the use of their medicaments and dentifrices The reports of the Council on Dental Therapeutics should be a source of informa tion for the pharmacist The Council determines the therapeutic and scientific usefulness of products manufactured for dental use The organization of that Council is the American Dental Association's attempt to rid its ranks of unscrupu lous manufacturers who have no regard for either science or truth

The American Dental Association is waging a consistent fight against quacks, cure-all venders and manufacturers It is refusing to rent floor space at dental conventions to manufacturers of questionable products, its leading dental journals are refusing to sell advertising space in their journals to manufacturers whose products are fraudulent or worthless In line with its campaign to inform its members of worthless products through the reports of its Council, it has laid down

rigid rules governing the admission of proprietary articles to the list of accepted non-official dental remedies

It would seem that pharmacists should feel the responsibility of working intelligently and cooperatively with the American Dental Association in its campaign against worthless and fraudulent medicaments and dentifrices

The rules of the Council are aimed to assure dental preparations of superior standard and quality Every wide-awake manufacturer of a product of which he is not ashamed will do everything he can to comply with the regulations of the Council If his product does not bear the stamp of acceptance of the Council on Dental Therapeutics and he will not disclose its ingredients, then you should know that there are one or more of the following reasons why his product is not meeting with the requirements of the Council

1 The composition of the product is secret
2 Suitable tests for determining the composition of the product were not furnished the Council
3 The advertising is misleading
4 The claims as to the origin are false
5 The therapeutic claims are unwarranted
6 The product is unscientific and useless
7 The package contains the names of the diseases or of conditions for which the product is used in such a way as to suggest self medication where self medication is probable

Of course a manufacturer may have a product which is useful and represent it truthfully, and may not have applied to the Council for approval Under such conditions ask for information regarding the product from the Council on Dental Therapeutics It would have much more professional significance if a pharmacist inquired of the Council regarding the merits of a product offered for sale by a manufacturer than to have a dentist write to the Council asking for information about a product a pharmacist tried to sell him Such a condition was actually experienced A member of the Dental Council brought the case to my attention urging me to advise pharmacists against recommending secret preparations to members of the dental profession

The Council on Dental Therapeutics asks only that a product have some scientific or therapeutic reason for its existence, that the material does what its makers claim for it, that its advertising is truthful and that it meets the other requirements of the Council as to composition, test and origin That is the basis for my urging pharmacists to make intelligent use of the findings of the Council and be the distributors to the dental profession for only such products as will help perpetuate the dentist's faith in drugs and preparations medicinal

Permission has been granted by the American Dental Association to publish the following list of Accepted and Non-Accepted Drugs and Preparations This list does not contain information concerning all the drugs sent to the Council for consideration, but it is *complete* in so far as the Council has published reports on Accepted or Non-Accepted Preparations to date Subsequent additions will be made to this list as reports are published by the Council Detailed analysis of the preparations and claims may be found by referring to the bibliography after the title of the preparation

ALCHEMICAL SYMBOLS *

BY J HAMPTON HOCH

Alchemy, the precursor of chemistry, is of interest to the pharmacist because, inasmuch as it has affected the science of chemistry, it has influenced pharmacy Some small remnant of alchemical terminology is still to be encountered in pharmaceutical synonyms, e g , water of Saturn, lunar caustic, crocus Martis, etc , and

* Section on Historical Pharmacy, A PH A Toronto meeting 1932

our present method of abbreviating the chemical elements is derived from alchemy through Geoffroy, Bergman, Dalton and Berzelius When viewed in the light of their remote antiquity, many of the symbols used by the mediæval alchemists were but modern applications of ancient ideographs

When and where the "royal art" originated is not certainly known Egypt is generally considered the birthplace of chemistry, or, to be more exact, of experimental alchemy The Land of Chem (or Cham), as Egypt was called, is the root of our word "chemistry"[1] and the Arabic article "al" prefixed to the same root gives us the word for the "black art" Egyptian priests were known to be adepts in certain chemical arts, and, during the later dynasties, their temples occasionally had laboratories attached

Frequently overlooked in the discussion of the history of alchemy is the fact that it originated as a philosophical system, "an attempt to apply, in a certain manner, the principles of Mysticism to the things of the physical plane" The experimental development of the philosophy is coeval with the beginnings of the science of chemistry The abstract teachings of the art are buried in a mass of figurative and symbolic terminology for the purpose of shielding the esoteric instructions from the eyes of the vulgar and profane, for the adepts considered a knowledge of their secrets dangerous for the generality of people,[2] and then, too, their free doctrine was at variance with established religion

Because of the liaison between alchemy of the spirit and alchemy of matter, the mystical and symbolic expressions of the former were perpetuated in the latter In any attempt to discover the origin and trace the development of the various symbols and curious designs with which later alchemistic writings are embellished, we must push back through the mists of antiquity, back to the beginnings of a written language, and even earlier, to the time when man first acquired an intellectual interest in the firmament

The usual coupling of the metals and planets leads directly to astronomy, the earliest of the sciences Astrology, which chronologically precedes astronomy, arose from man's interpretation of the changes of the celestial bodies as tokens of good-will or enmity, of favor or displeasure of the gods What primitive man did not understand he feared, and there was much that he did not understand Contemplation of the heavens and the realization that their phenomena intimately concern man and all nature placed them in the category of Ultimate Causes The personification and deification of the sun and moon are older than any written records, the worship of the stars was usually subordinated to the "King and Queen of the heavens"

The worship of earth, air, fire and water sprang from fetichism, and primitive religions passed the worship of these elements down to the Sumerian and Egyptian civilizations, where this worship became a part of the religious system Every

---

[1] First use of the term is found in the writings of Zosimus of Panopolis, in Upper Egypt (3rd–4th century)

[2] Philon the Jew (*c* 20 B C –40 A D) in "De Vita Mosis" particularizing the sciences which Moses studied in Egypt mentions Symbolic Philosophy (written in sacred characters) which the Greeks had heard came from the Assyrians who transmitted the art of letters and the Chaldeans who understood the science of the stars

phase of nature was, over the course of centuries, provided with a special guardian and controlling deity

The Greek philosopher, Empedocles of Agrigent (*c* 440 B C), considered fire, air, water and earth (deified as Zeus, Hera, Nestis and Aidoneus) to be the four elements, a fifth, "ether," was added by Aristotle "These elements were regarded not as different kinds of matter, but rather as different forms of the one original matter, whereby it manifested different properties" The two alchemistic principles generally called "man and woman, red and white, sun and moon, sulphur and mercury," were likewise regarded as properties rather than as substances "Salt" was later added by Paracelsus as a third elementary principle

The blending of cosmogonic and religious ideas was well advanced in Babylonia as far back as thirty-five centuries before our era, when specific deities were connected with the sun, moon and planets [1] The further development of Babylonian astrological views, chiefly under Greek influence, led to the idea that each of the seven metals was under the influence of one of the seven planets, and this idea culminated in the Ptolemaic system which endeavored to bring all the known sciences within the scope of astrology Thereupon the tendency to use the names or astronomical symbols of the planets for their respective metals followed quite naturally

The human mind is so constituted that it craves symbols for the representation of its ideas and principles, and this tendency was particularly strong in the peoples of the East In the astronomical signs for the sun, moon, planets and zodiac we have symbols representing, directly or metaphorically, by form or significance, the objects intended In the following sections we shall attempt to show how the various symbols for the metals came to be used in their respective forms

Gold is represented as a circle with or without a point at its center This symbol is the divine circle associated with the sun The ancient Sumerians worshipped a sun-god whom they called Utu or Babbar Their earliest symbol for this deity was  , later (about 2400 B C) modified to  which was as close as they could approximate a circle with cuneiform writing This sun-worship penetrated prehistoric Egypt, where it became the main religion of the early kings, as early as 3100 B C, imposing itself on a substratum of totemism Ra, the sun-god, was designated by the divine circle in the hieroglyphics of the Egyptians,[2] clearly a personification of the physical sun as was also the Babylonian Shamash, the Greek Helios, the Latin Sol Identification of Ra with those local deities which he did not supplant resulted in many titles being given to the sun-god [3] The desire of the ancient rulers to be considered divine gave rise to the king-sun

[1] The astronomer priests noting the number of planetary bodies came to ascribe a particular sacredness to the number seven, and the seven planetary deities held a place of peculiar consequence amid the spirits of heaven and earth in Mesopotamia

[2] Breasted says that the most ancient symbol of the sun god was a pyramid Amenhotep IV (*c* 1370 B C) gave a new name and symbol to the sun a disc with rays

[3] Theocrasia was very prevalent in Egypt The worship of Ra was grafted onto that of Atmu (Tem) while Osiris and Heru neb (the golden Horus) and Amen and Chnum and Aton were all fused at different times with the sun deity

idea and the sun was frequently referred to as "noble," "king," "lord" Although a female goddess at first, masculine attributes very early supplanted the feminine ones which were then assigned to the moon The inherent color of gold was likened to the sun, which was described as "golden-eyed," "golden-tongued," "golden handed," etc The hieroglyph[1] for the metal gold  itself is a simplified form of the winged-disc, a flying-sun deity (Horus) of Upper Egypt

The Greeks distinguished between physical light and mental illumination—a distinction which placed Helios on one side and Phoebus Apollo on the other Helios is represented with the solar disc and rays behind his head in an ancient Trojan relief, while Apollo hurling his disc alludes to the course of the sun through the sky

The old Roman family of the Aurelii were believed by the ancients to have taken their name from the sun, their family deity [3] Although occupying an insignificant part in the religion of the ancient Romans, sun-worship, introduced from the East, received imperial patronage in the first century before our era and spread throughout the empire, where Strabo says the Persian god Mithra was worshipped under the title of the Unconquered Sun The Roman gods Sol and Apollo were both sun-gods, neither more sharply distinguished from each other than the Greek Helios and Apollo

The character for silver is a semicircle or a crescent The gradual waxing and waning of the moon to the primitive mind was personified by woman, and the ancient moon goddesses were mostly mother-deities, spouses of the sun [4] The Assyrian Sin and Egyptian Isis (especially in later times) were linked with the moon The symbol of Sin was a crescent moon, a moon was the head dress of Isis, the Queen of Heaven, to which the horns of the cow-goddess Hathor (Het heru) were added after the fusion of the two deities The hieroglyph for silver  * was a combination of "het" ( -white) and "nub" (gold)

As goddesses of the moon, the Grecian Selene and Artemis stood in the same relation to each other as Helios did to Phoebus Apollo Selene is figured with a half-moon on her brow, or less frequently with horns

---

* Chaucer in Chanones Yemanne s Tale says

Sol gold is, and Luna silver we threpe,
Mars iren Mercurie silver we clepe
Saturnus led, and Jupiter is tin,
And Venus coper, by my faderkin "

The sequence found in the old cuneiform literature of Babylonia is Sun, Moon Jupiter (tin) Venus, Saturn, Mercury, Mars

[1] Assyrian monuments show the sun represented as a disc with long wings similar to the Egyptian hieroglyph

* The author corrects symbols for gold and silver in saying that the dots should be open circles —*Editor*

[3] The Latin aurum ' apparently derives from the name of this family which Frazer says should be Auselii since the old Sabine name for the sun was ausel "

[4] The old Babylonian moon god Nannar (Enzu), worshipped at Ur was masculine

The second most precious metal was naturally associated with the moon, wife of the golden sun, since the color of her lustrous beams was very like this metal The silvery moon was as much the theme of the ancient poets' lays as it is the motif of modern songsters

Tin is symbolized by the sign of Jupiter ♃ Some have suggested that this symbol represents Jove's thunderbolt, others that it is a modified form of the Greek zeta, the first letter of Zeus s name We are inclined to a much earlier derivation

The Roman sky-god, Jupiter (from Zeus pater), and his Grecian counterpart were omnipresent and beneficent deities, controlling all the heavenly phenomena In Egypt the local god of Thebes, Ammon (Amen), had been raised to the first position in the pantheon, where, as Amen-Ra, he was regularly called "King of the Gods and Lord of the Throne " The ram was sacred to Amen and his head-dress is represented with the roundly curved ram's horn The combination of the curved horn and the scepter of the god gives us the character for the sky-god

In the Sumero-Accadian pantheon we find Marduk associated with the planet Jupiter, and although he, too, was called "King of the Heavens," we can adduce no symbol similar to that used for tin

The symbol for copper, a circle with a cross beneath, is the planetary sign of Venus According to Bailly, the mirror of the Roman goddess of love and beauty is the source of this symbol Since the worship of Venus was not general in Rome until later times, an earlier derivation is indicated

One of the most celebrated shrines of the ancient world was the temple of Aphrodite, at Paphos in Cyprus This Grecian goddess of love—the love thought to be the cause of productiveness—was intimately associated with the island of Cyprus[1] whose rich copper mines were early exploited by the Phœnicians In fact, the Phœnician Astarte was the transplanted source of Aphrodite[2] The Phœnicians, in turn, had adopted the Babylonian mother-goddess, Ishtar, who embodied the reproductive energies of nature, and who had been identified by the Babylonian astronomers with the planet Venus

The Egyptian hieroglyph for copper bears no resemblance to any of the symbols or attributes of the mother-goddess, but the ankh or crux ansata, the symbol of life, is extraordinarily like the symbol for copper This "cross with a handle," borne by almost every Egyptian divinity, represents the male triad and the female unit and is a likely character to associate with the great goddess of fertility

Lead is characterized by a sickle, the sacred emblem of Saturn The association of the scythe with the precursor of Saturn, the Grecian god Kronos, is well known We could elicit no similar emblem from Egyptian or Babylonian deities connected with this planet and, therefore, incline to the belief that the association of this symbol with the planet Saturn does not antedate the Greeks

Mercury is symbolically represented by a circle, joined to a crescent above and a cross beneath Some have claimed that this character represents the caduceus which Mercury carried in his hand in his flying embassies for the gods Mer-

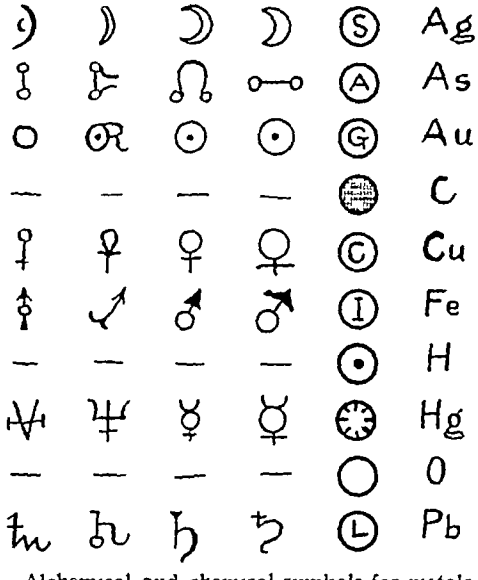
[1] The word cuprum is derived from the name of this island

[2] Lucian identifies her with Selene the moon goddess and with the planet Venus

cury, or Hermes as he was known to the Greeks, undoubtedly was derived from the Egyptian god Thoth (Tehuti) [1] As a "power from heaven," Thoth represented the divine intelligence, the scribe of the gods, and was the inventor of all the arts and sciences Among the emblems associated with this deity, the combined disc and crescent is used to express certain phases of his character, and we think the probable source of the emblem for "argentum vivum" is the combination of the ankh and the crescent

The "hermetic' books attributed to Thoth have their counterpart in the "Wisdom of Nebo," a set of tablets in the royal library of Nineveh, attributed to Nebo (Nabu), the Chaldean god presiding over knowledge and intelligence, the scribe of the gods, the originator of writing The symbol of Nebo, however, does not resemble the symbol of Thoth

Symbols for Metals *



Alchemical and chemical symbols for metals The first three are in sequence of the 15th, 16th and 17th Centuries The next three 1783, Bergmon, 1808, Dalton, 1814 Berzelius—from Ingo W D Hackh—"A Chemical Dictionary "

The character used to represent iron is derived from the shield and spear of the Roman god, Mars, who, as the god of war, was naturally furnished with the two most common instruments of war The fiery aspect of the planet Mars corresponds well with the bloody character of the deity by whose name it is distinguished The Grecian counterpart of Mars, called Ares, was also represented with the shield and spear Although we can adduce numerous connections between the planet Mars and the war gods of ancient peoples, we know of no definite symbolism of spear and shield antedating the Greeks

The literature of alchemy during the early centuries of our era is very scanty The Roman emperor Diocletian decreed (292 A D) the destruction of all the books of the alchemists, fearing that the opulence of the Egyptians would make them less tractable to imperial demands Copyists of Syrian and Moslem academies managed to preserve for us a few of the writings, the Moslems being the continuers of the Hellenistic tradition and the initiators of medieval alchemy Translations, introduced into Western Europe through Moslem Spain during the 12th and 13th centuries, furnished the soil from which the extensive alchemical literature of the succeeding centuries flowered The use of symbols passed from the Greeks to the Syrians but not to the Moslems, who had a religious objection to figures or drawings of objects as tending to idolatry Symbols first found their way into medieval European writings on alchemy about the 15th century through Greek copies of the

[1] The ancient Greeks adopted most of their theology and mythology from the Egyptians

* See page 434

Syrian works Distortions and mutilations had crept into the copies during the passage of time and because of repeated transcriptions The obligation of secrecy continued to be stressed,[1] and symbols and secret names finally became legion

The various symbols underwent very little change during their transmission through the centuries, although new characters were devised to represent the ever-increasing number of substances with which the "pseudo-alchemists" experimented in their search for the "elixir" and the ' stone " These symbols were a convenient shorthand system at a period when caligraphy was little employed, and so the muddle of arbitrary figures wriggled and twisted over the pages of pharmaceutical and chemical writings down to the 19th century, when they were replaced by our present method of abbreviation

[1] The hermetic philosophers continued to write in figures of speech and with symbols because they feared the persecution of the Church Augustine began the war on symbolic language, the use of which he declared was a characteristic of the Gnostics and from 325 A D on, every departure from the beliefs of the state church was considered a state offense Pope John XXII, in the 14th century, issued a strong bull against the hermetic art as devil's work The 15th century saw local decrees against alchemy in Venice and Nuremburg, also by the English Parliament

ADDRESS OF THE PRESIDENT OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

BY ROBERT L SWAIN

Due to an unusual spirit of forbearance, the address of the president has become one of the time-honored customs of these annual meetings And, relying upon a continuance of your good nature, I am happy to conform to the custom to-night But first, let me admit my indebtedness to that line of fine men who have preceded me in this high office I confess freely that much of the inspiration which has come to me is the result of an interested and diligent study of their distinguished work Nowhere is there to be found evidence of a higher ideal, a more earnest and practical point of view or a more consistent purpose than in the presidential addresses delivered before this body As I look back upon this great mass of constructive material, I can only venture the hope that I have measured up, as best I could, to the high standard they long ago set up

R L SWAIN

One of the very first things the president of this ASSOCIATION faces is the vast responsibility which he must carry To be compelled to pass judgment, to make decisions, and to take a real part in working out policies and problems is vastly different from sitting in idle contemplation on the passing scene No president, I am sure, ever sought to shirk his responsibility I, in my own way, have attempted to face mine

As I look back over the eight months of my term of office, I am certain that some worthwhile things have been done I am conscious that I have approached my problems in my own way I am aware that I have seen the office through my own eyes In other words, there is such a thing as the presidential interpretation of the presidency

This address, then, is my interpretation of the presidency I want to emphasize that I am expressing my own views I am submitting personal evaluations and interpretations of the many things which have demanded my attention I stress the personal nature of this address so that the ASSOCIATION may be completely free to act as it seems best regarding the proposals I advance or the suggestions I submit The ASSOCIATION is fully absolved from any collusion or collaboration in these respects

For these reasons, I shall make no attempt to give you a detailed statement of the general work the ASSOCIATION has carried on Fortunately, much of this is done year in and year out with little thought to the one then holding the presidential chair This work is peculiarly and preeminently the work of the secretary and he should present it I have purposely sought not to infringe upon his field It is to the secretary that we should look for portrayal of the ASSOCIATION year, and for an analysis or interpretation of the work carried on The secretary's

report should be printed in advance of the meeting, and be made an outstanding feature of the annual program

At the outset of this address, I desire to express my real devotion to the principles which have actuated the AMERICAN PHARMACEUTICAL ASSOCIATION since its inception A high note was sounded at the very beginning Within their sphere and for the fulfilment of their purpose, the great Constitution and Code of Ethics formulated at the first meeting of the ASSOCIATION in 1852 stand with the finest expressions of professional opinion to be found anywhere Even at this late day, they challenge our admiration, and impel us to renewed devotion Throughout its history, the ASSOCIATION has been steadfast in its adherence to sound ideals Petty politics have not crept in, self-seeking has not asserted itself, and nothing has been able to entice it away from the early precepts It stands to day as the embodiment of sound thinking, unselfish leadership, and as pointing the direction in which pharmacy might safely move In spite of the changes which have come about on all sides, and in spite, too, of the uncertainty and confusion of the moment, the ASSOCIATION should continue its efforts to advance pharmacy as an essential public health profession The ASSOCIATION is faced with a magnificent destiny The future of pharmacy may well be said to rest upon its integrity To-day the AMERICAN PHARMACEUTICAL ASSOCIATION has become recognized as a national, non-profit, professional body of pharmacists, pharmaceutical educators, law-enforcement officials, research workers, and others interested in the protection of public health and the treatment of disease It is my earnest hope that its activities may be confined to the fulfilment of these high and inspiring purposes

This meeting of the ASSOCIATION will long be remembered as one of great historic significance The center of the stage is held by the American Institute of Pharmacy, as the headquarters building of the ASSOCIATION has been so rightfully named The dedication exercises, to be observed to-morrow, mark the close of one important phase of this great undertaking This magnificent building, a real epic in marble, represents one of the most important accomplishments of our profession It typifies, in a peculiarly beautiful manner, the highest ideals of pharmaceutical efforts It proclaims, in wondrously pleasing notes, the meaning of the service which pharmacy carries on It stands, as it will long continue to stand, a classic tribute to those who have seen beyond the confusion of the moment to the deep cool pools from which come intrinsic and lasting things

While the dedicatory services are not to be anticipated at this time, I do want to point out the necessity of using the building as a real pharmaceutical workshop A magnificent plant has been provided, and is now ready for the best possible use Every group, devoted to the professional advancement of pharmacy, should center its activities here No more fitting place can be found for the offices of the American Association of Colleges of Pharmacy and the National Association of Boards of Pharmacy The work which they do is closely connected with the basic purposes of the AMERICAN PHARMACEUTICAL ASSOCIATION These two organizations would immediately find themselves more closely in touch with national thought They would become, in every sense of the word, the national authorities in their respective fields

Not only should these two great groups be brought in, but there are many other activities which the ASSOCIATION should inaugurate as promptly as possible There is an urgent demand for additional publications Surveys and special professional and economic studies await only the facilities with which to proceed Statistical, legislative and legal departments should be set up Research studies bearing upon the United States Pharmacopœia and National Formulary should be provided for The drug industry should look here for the establishment of drug standards, and for working out the important technical and scientific bases upon which they rest With these functions in full swing, little would be needed to make this building a practical and effective pharmaceutical institution

It is recognized, of course, that any such program requires funds When the building project was first launched, the objective was one million dollars The half-way mark has been nobly reached There remains the second, and perhaps equally important part Adequate financial support must be forthcoming if the ASSOCIATION is to carry out its magnificent plans, and do the job that must be done With this thought in mind, I recommend that the Committees on Campaign Funds, Site, and Plans for the A PH A Headquarters Building be discontinued, and that a new committee be set up to consolidate the work done so far and to push on to the ultimate objective I would suggest that the title be the American Institute of Pharmacy Maintenance Committee This committee should be empowered to undertake the collection of funds for the maintenance and development of the ASSOCIATION'S activities so that the best use may be made of the facilities now enjoyed

I further recommend that Doctor H A B Dunning, chairman of the present Campaign Fund Committee, be asked to assume the chairmanship of the Maintenance Committee No one knows more than I the great load he has carried, and the fine job he has done Under other circumstances, I should feel that he has earned the right to retire However, as great as has been the success of his labors, I believe a larger opportunity awaits him Without his judgment, his faith, his idealism, it is certain that the headquarters building would not have been so promptly realized With his great talents placed behind this final phase of the job, I am sure it will be brought to a successful conclusion

I should like to pay my personal tribute to all who contributed in any way to the erection of the headquarters building Over thirteen thousand people pledged funds for this great undertaking I especially desire to express thanks to the members of the various committees engaged in this work For ten years they labored for the attainment of their goal They have made a contribution to the ASSOCIATION and to pharmacy which will stand as an inspiration for ages to come The joy which comes from doing the job should be theirs on this great occasion

The past year has been an outstanding one in the A PH A For a long time, the ASSOCIATION has been working for the recognition of pharmacy as a requirement in every hospital It is with pleasure that I announce that the Council on Medical Education and Hospitals of the American Medical *Association* has accepted this view, and now lists pharmacy among the essentials of a registered hospital The Council states that "the handling of drugs should be adequately

supervised, and should comply with State laws" The AMERICAN PHARMACEUTICAL ASSOCIATION is to be congratulated in bringing this great effort to a highly satisfactory conclusion

The final publication of the Prescription Ingredients Survey and the Studies of Professional Pharmacy as carried out by the St Louis Drug Store Survey impress me as basic contributions to the betterment of pharmacy They supply the structural data upon which the profession depends I strongly urge these publications upon the educational and registrational groups, and upon all interested in the development of pharmacy along professional lines

The fiftieth anniversary of the establishment of the National Formulary is fast approaching The ASSOCIATION should mark the occasion in a fitting manner It is noteworthy that the New York Branch has already commemorated the forerunners of this highly significant event The National Formulary is one of the great pieces of work the ASSOCIATION has developed It is recognized, together with the United States Pharmacopœia, by federal and state food and drug laws as a legal standard In many states, the pharmacy laws demand that a copy of the current standards be kept in all drug stores at all times It is recommended that a determined effort be made to have such a provision in the laws of every state The National Formulary has become an essential adjunct to medical practice It is a most fitting expression of professional pharmacy The ASSOCIATION should never lose sight of its responsibility in this matter, and should bend its every effort to maintaining the National Formulary in the high position it has attained The ASSOCIATION is greatly indebted to Doctor E N Gathercoal and his colleagues on the Revision Committee for their devoted work preparatory to issuing the sixth edition

The annual observance of Pharmacy Week had its inspiration in this ASSOCIATION, and has always been regarded as peculiarly within the field covered by this body I have always felt that setting aside one week for the presentation of professional pharmacy to the people of this and other lands is as little as a professional group can do I have not the slightest doubt that the future of pharmacy depends entirely upon its professional service It is the basic thing in every pharmaceutical effort Pharmaceutical legislation, pharmaceutical education, the whole of pharmaceutical service rests upon the professional character of pharmacy Pharmacists should be keen to recognize this, and diligent in their efforts to impress it upon the public mind I cannot be too emphatic in urging pharmacists to embrace every opportunity to advance and elevate their professional work as a basic and fundamental thing The principles underlying it are sound, and the whole idea is a dignified and worth-while approach to a most important subject I hope that 1934 will witness the most zealous observance of Pharmacy Week

The Remington Medalist this year is Sir Henry S Wellcome This medal is awarded by the New York Branch of the ASSOCIATION to that pharmacist who has done most for pharmacy Sir Henry would seem peculiarly worthy of this honor He is one of the truly great men developed in this profession His research studies have benefited the entire world He is regarded as one of the most enlightened philanthropists It is fitting, I think, that the award should be made an outstanding feature of this meeting

There are some defects, so I believe, in the organizational set up of the ASSOCIA-

TION It is my judgment that the retiring president should become a member of the Council Such a procedure would benefit the ASSOCIATION by keeping the president in active service for at least two years I, therefore, recommend that the Constitution and By-Laws be amended so as to bring this condition about. I have no hesitancy in making this recommendation because, under the rules, it could not become effective until the close of my successor's term of office

I am also constrained to suggest that study be given to the custom which has sprung up of nominating the chairman of the House of Delegates for the presidency In this matter I speak from experience Inasmuch as the chairman of the House appoints the Committee on Nominations, I have felt that it was an embarrassment to him to be the recipient of honors at the hands of his own committee If the chairman, by virtue of his office, is to be nominated for the presidency, then the By-Laws of the ASSOCIATION should so state A study of the matter over the past few years will show an almost unbroken precedent in this respect I have no real objection to the matter although the House of Delegates was not organized with this thought in mind However, simply to bring the question squarely before the ASSOCIATION, I recommend that the chairman of the House of Delegates be ineligible for nomination for the presidency during his term of office In case this is favorably acted upon, I further recommend that it shall not apply, in any sense, to the incumbent chairman or vice-chairman

I have come to the conclusion that it is probably unwise to nominate three candidates for the presidency Such a three-cornered contest seems to me unsuited to the purposes of the ASSOCIATION I should prefer to see two candidates only As the matter now stands, the Committee on Nominations can be regarded more nearly as a Committee on Elections By a strategic grouping of the candidates, the election of one can be readily brought about I think it would be much more in harmony with fair practice to make nominations on the basis of merit, and leave the election to the wishes of the membership A Committee on Nominations is a helpful thing only so long as it restricts itself to making nominations It goes beyond its province, and renders the ASSOCIATION a pronounced disservice when it seeks to control the election I think the successive Committees on Nominations should be instructed to study the general prevailing conditions, and to select men from different sections of the country for nomination for the presidency, so that all sections might be honored in this way Of course, the governing principle should always be the good of pharmacy and the advancement of the interests of the ASSOCIATION However, it is believed that this principle can be served and all sections of the country recognized at the same time For this reason, I recommend that the By-Laws be so amended as to provide for the nomination of two candidates only

I have given careful thought to the work done by the Committees on Prescription Tolerances and Weights and Measures As the work of these two groups develops, it will be found mutually inclusive I thus suggest that the chairman of the one shall be an ex-officio member of the other I recommend that the chairman of the Section on Practical Pharmacy and Dispensing be an ex-officio member of each of these committees This section is peculiarly concerned with prescription tolerances, and the actual conditions under which compounding and dispensing are carried on, and should have an official part in furthering these two Asso

CIATION projects The annual reports of these committees should be submitted to the Section on Practical Pharmacy and Dispensing as a regular routine

Some notice should be given the great questions raised by the passage of the National Industrial Recovery Act Pharmacy, in all its branches, became immediately involved in the machinery thus set up Some have criticized the ASSOCIATION, because of its strong place in the professional field, for taking a part in what the critics have wrongfully considered a purely economic problem However, the NRA movement is not necessarily economic I would prefer to state its purpose in terms of social adjustment In other words, pharmacy, together with all other interests, was drawn into an effort, the ultimate purpose of which is to effect profound social change With this view clearly in mind, I doubt that anyone can deny that this ASSOCIATION had a real place in working out whatever was thought best for pharmaceutical interests For my part, I think the ASSOCIATION would have been grossly derelict in its duty had it failed to take its share of the responsibility Whatever may be the ultimate results of the recovery program, every one knows that it has brought about profoundly significant changes in our national thinking and point of view The present manifestations on the political screen may be understood and accepted with less difficulty if they are seen as an effort to work out a sounder social creed, and to make social forces more compact and articulate Undoubtedly, it is a profound experiment in the realms of sociology and economics But, the mere fact that it deals in vastly important human equations, and is devoted to the betterment of human relations, makes it an experiment in which all must participate

The NRA program, the whole code effort, as imperfect and contradictory as it undoubtedly is, is simply the first manifestation of forces seriously devoted to the task of creating a new economic system which will be more responsive to the social impulse Much of what is being done is highly controversial Some see in it an attempt to overthrow existing political institutions Some have gone so far as to declare that we are in the midst of a social revolution, the aims of which are in open hostility to constitutional government as that term is generally understood I think there is real evidence of some such desire on the part of those who are easily influenced by philosophies they cannot understand, and who fall a prey to silly and half-baked generalities Specifically, I am content to leave these mental scarecrows, whether they be in the Government service or outside of it, to sizzle in their own pot They are no more than mildly pathologic pimples on an unusually healthy body Whether they disappear or whether they remain is not of the slightest importance America, thank God, rests on something more secure

I am certain that in due course, and time must be given to working out any fundamental concept, the general principles recognized in the codes will be shown to be advantageous to all branches of industry and society Already it must be apparent that the imperfections and contradictions are being ironed out In all of the present disturbances and confusion, we should seek to see things over a long range The mere fact that an attempt is being made to meet certain situations is a far cry from an abandonment of our basic institutions I am certain that we shall emerge from the present strife a more intelligent and a more awakened people

I am truly proud of the great part played by the ASSOCIATION in this national drama I am proud that its prestige was recognized, and that its sane and con-

servative view was relied upon in working out the problems of the past few months Undoubtedly, the ASSOCIATION has won a larger place in the hearts and affections of pharmacists themselves I know that the Government has come to a much sounder appreciation of what pharmacy is from the mere fact that the ASSOCIATION faced into the fight rather than standing on the side-lines while issues of such ter rific importance were being fought out

At this point, I should like to suggest that some study be given to the forma tion of state codes I am inclined to feel that much of the Federal systems of codes will prove unsound and unworkable There is grave doubt regarding their legality Aside from the national emergency, they would undoubtedly be given little consideration They are in direct and flagrant conflict with constitutional government in this country To make them permanently effective requires a complete abandonment of the principles for which the country is understood to stand After the emergency has passed, there will still be good reasons for out lawing unfair business practices, and for retaining public supervision over hours and wages of employment While there is no assurance that state codes will be free from legal defects or constitutionally sound, it is believed they offer some promise of permanently dealing with certain aspects of the matter State codes have been set up in a few states It is recommended that a special committee be appointed to make a thorough study of all state codes, and the legislative acts under which they have been created, as many of their provisions are certain to affect the conditions under which pharmaceutical service is made available

I cannot forego this opportunity of expressing officially and personally my profound appreciation of the part played by Doctor E F Kelly in the great scenes of the past few months Pharmacists everywhere should know just what a bur den he has carried With no intention of disparaging in the least the work done by other pharmacists and other pharmaceutical organizations, I am confident that Doctor Kelly has carried a large part of the load Against his will, he was drawn into the center of the fray from the very outset He was called upon to work out the problems which became acute under the President's reemployment agreement When the whole matter became deadlocked over the hours under which drug stores were to operate, and pharmacy stood to suffer extremely heavy burdens, other pharmacists and other organizations called upon Doctor Kelly to iron things out In all of this, he consistently refused to appear except as cooperating with others for the general good He bore the brunt of the negotiations which finally resulted in the Retail Drug Code Upon the insistence of national pharmaceuti cal leaders, he became a member of the National Retail Drug Trade Authority Later, by the same forces, he was placed on the Committee on Service and Distri bution, to make a study of distribution factors which affected the retail field He has been in almost continuous contact with NRA officials, and has done much in bringing them to a sounder and more equitable view of many problems bearing upon the professional and commercial phases of the drug store Pharmacy owes him a debt far beyond its power to repay

I should like to devote a few serious remarks to the so-called "labor contro versy" that has sprung up in pharmacy as a result of Paragraph 7-*a* in the National Industrial Recovery Act This paragraph provides for collective bargaining be tween employer and employee I have publicly stated that I was opposed to col

lective bargaining in pharmacy I am certain that my position has not been fully understood I am certain, too, that it has been deliberately misunderstood and misinterpreted by some Some have attempted to make it appear that I was hostile to the interests of those employed in retail drug stores While such criticism is utterly unfounded and directly opposite to my feeling in the matter, I shall make an effort to clearly present my views on this very important question

By stating that I was opposed to collective bargaining in pharmacy, I merely meant to express the feeling that pharmacy could and should manage its own affairs I meant to voice my opposition to bringing labor tactics into a professional field In no sense did I mean, even by implication, to create the impression that I was opposed to a betterment of the conditions under which some employee-pharmacists work Employee-pharmacists are members of the pharmaceutical profession, and should be entitled to all the benefits and privileges which come to members of a professional class It is my honest and serious conviction that, in the long run, bringing labor methods into pharmacy will result disastrously to all pharmaceutical interests

By this statement, I do not mean to enter upon a discussion of the merits of any labor movement when confined to a purely labor field I do not claim to be sufficiently informed regarding general industrial conditions to voice the slightest criticism of the methods labor feels are necessary to its security and welfare I am merely attempting to emphasize the dangerous consequences which are likely to follow when a professional calling is made to conform to policies and procedure which have been worked out in industrial and labor pursuits I am convinced that there are basic and insurmountable objections to making pharmacy subject to the forces that control in a purely labor enterprize

First of all, and this is of basic importance, no great distinction exists between pharmacist-employer and pharmacist-employee In fact, the distinction which may be said to exist is purely artificial In most cases, it goes no further than to impose greater business responsibility upon the employer The employer must of necessity assume the burdens which go with ownership, and he must exercise sufficient authority to make his plans and policies operate This is unavoidable if the store is to function in a satisfactory manner However, I am certain that this does not constitute a disparaging distinction Disparaging distinctions, if they do exist, should be brushed aside as inconsistent with the close relationship which must exist between the pharmacist-employer and the pharmacist-employee

Pharmacist-employer and pharmacist-employee hold a unique relationship to each other They come in close personal contact, and are engaged in exactly the same duties The law requires that both shall conform to the same educational and professional standards Both must measure up to the same degree of competency and skill Each is a graduate of a recognized educational institution, and frequently it is the same institution The law prescribes their duties, and confers the same privileges Their daily work touches vitally the life and happiness of people They are mutually dependent upon each other The reputation of the employer is in the hands of his employee, and the reputation of the employee is in the hands of the employer Mutual obligations and mutual responsibilities rest upon both There would seem no possible justification for industrializing this

peculiarly intimate relationship It would seem the one place where mutual confidence and respect should have full sway Anything which disrupts or attempts to destroy this relationship comes very close to being inconsistent with the public welfare

However, for fear this statement may be construed as submitting the ideal instead of what actually exists, let it be admitted frankly that there are many cases in which pharmacist-employees have not received the proper treatment or been accorded proper recognition with all that the terms convey Studies by the NRA and others have shown inadequate pay, long hours and other unwarranted conditions Employees are well within their rights when they insist that such conditions shall be remedied whenever and wherever they exist Pharmacy, as a whole, should encourage the expression of honest opinions, and should make no attempt to escape a facing of the facts If unfair conditions exist, no progress worthy of the name can be possible until the facts are recognized and dealt with as they deserve

I believe that remedial measures can be applied within our own ranks Nothing is required beyond an awakened professional consciousness Organized pharmacy, as that term has been understood, should make every effort to learn the facts and to deal with them It should be regarded as a family affair to be dealt with as family discipline demands An immediate survey should be made of every drug store in the United States to ascertain the hours of employment and the prevailing pay for pharmacist-employees While state and local pharmaceutical organizations might well carry out the survey, I suggest that the United States Government be requested to do it so that there can be no question as to its accuracy and fairness This whole question goes to the very heart of professional integrity, and I believe the AMERICAN PHARMACEUTICAL ASSOCIATION should take the leading part in working it out

Employee organizations, on the mere basis of recognizing the employee status, are, in my opinion, unfortunate They serve to fan prejudices and perpetuate distinctions which should not exist at all They also serve to accentuate differences and problems which may not be nearly so acute once the facts are known It would seem much better to organize, if the employees really feel that separate organizations are needed, so that their professional status always stands out My own feeling is that the existing pharmaceutical associations afford every necessary means of meeting their problems, and I urge that these bodies make every effort to cooperate as fully as possible with the employee-pharmacist in solving their mutual problems However, in spite of what form the employee movement finally takes, there is a great responsibility resting upon both the employer and the employee Neither should countenance any act by the other which is damaging to the inherent thing so necessary to both Both sides should regard themselves as saddled with mutual responsibilities and as faced with mutual obligations The welfare of the profession is the basic thing, and this is larger than any issue which either side can raise

In any consideration of this subject, it should be borne in mind that retail pharmacists have felt their full share of the economic distress All over the country, city and town alike, operating costs have steadily mounted while sales volume has dropped to unprecedented levels Profits have disappeared, and hundreds,

if indeed not thousands, of retail drug stores have been operated at an actual loss Undoubtedly, some employers, in pharmacy and outside of it, have taken advantage of the unfortunate period through which we are passing However, I shall be much surprised to learn that the great majority of pharmacist-employers have not done their very best under most difficult and discouraging conditions The facts, once they are ascertained, can be understood only in the light of circumstances

Some reference should be made to pending food and drug legislation At the 1933 meeting, the ASSOCIATION took the position of favoring all changes necessary to the protection of the public and as in opposition to delegating sweeping and unregulated powers in its administration I have adhered to this position strictly Personally, I was opposed to many of the provisions contained in the original Copeland bill The very extensive and general powers conferred upon the Secretary of Agriculture impressed me as unnecessary to the proper protection of the public, and as inconsistent with many established principles of constitutional government Some went so far, so I firmly believe, as to set aside basic concepts of the common law which have been cherished as essential to a liberty-loving people I have always felt that it was unwise, and in most cases unnecessary, to place great undefined powers in the hands of administrative officials It is a tendency in government which I think is definitely dangerous, and which I shall always oppose If this country is to move forward in the realization of the great purposes to which it is dedicated, it must continue to be a government of laws and not of men

From the very beginning, it has been my opinion that the present Food and Drugs Act should be amended, and nothing which has transpired has shaken this view It has been said, of course, that the act was so hopelessly defective that it could not be amended so as to meet current needs This, to me, is mere propaganda, and has no support from the actual facts Following through the policy adopted by the Government is certain to throw out of gear State and Federal cooperation, and to produce a confused mass of contradictions which will plague us for years to come It seems to me the most impractical means of meeting the situation However, the Government seems committed to the impractical means, and I set forth this view simply to make my position clear

I am confident that sounder legislation will result from the criticism which the various Copeland bills have received There is no longer any intention of conferring arbitrary and unnecessary powers upon administrative officials The whole job is being looked upon in a saner and altogether sounder way, and thus is certain to result in a much safer, and a much more effective piece of legislation As a personal view, I desire to concur fully in Senator Copeland's statement that he would rather have no legislation on the subject than to accept a meaningless and spineless compromise I believe there are great defects in the present act, and thus great public reasons for bringing it up-to date I agree with the desirability of every objective which these bills have sought I regret that an arbitrary position by the Government, calling forth an equally unyielding attitude from the industries involved, has made the outcome very much confused

In all of this, the ASSOCIATION should hold fast to certain principles The Food and Drugs Act should be rewritten so as to include cosmetics, and to bring

advertising under federal supervision and control No necessary power should be denied the enforcing agency The public interest should be the paramount consideration On the other hand, broad, sweeping and uncontrolled powers should be withheld as unnecessary to the purposes of the act, and as inconsistent with our theories of government Industry should not be unduly harassed, but should be given every freedom consistent with the basic purposes of the act

It is my belief that the AMERICAN PHARMACEUTICAL ASSOCIATION and the National Drug Trade Conference rendered a real service to the country in opposing certain features of the Copeland bill Their position, presented in a forceful and logical manner, centered attention on the bill's dangerous provisions, and was the most potent influence in having them substantially modified

This ASSOCIATION asserted the need for higher drug standards back in 1852, and since that time has stood steadfastly behind all efforts to bring this about by legislation Many times its voice was the only one raised to this end It stands to-day, I have no doubt, ready to cooperate in all efforts to protect the public by demanding the highest practical standards for foods and drugs Its position throughout the present controversy has been in keeping with its high professional standing, and consistent with a sound regard for constitutional government. And this, let me insist, is vastly more important than extreme views whether they be advanced by overly zealous governmental experts or by selfish reactionaries in the food or drug industries

It will be recalled that some few years ago the ASSOCIATION, in cooperation with the National Association of Boards of Pharmacy and the American Association of Colleges of Pharmacy, sought to have a comprehensive survey made of pharmacy to ascertain the basic facts underlying it This survey was not actually begun because of the lack of funds It is to be hoped that this undertaking can be carried out as promptly as possible The time has come, I fully believe, when pharmacy must be seen in terms of social force if it is to keep step with the thought and tempo of the times

We might as well realize that no permanent progress can be made unless we understand the meaning of pharmacy in the life of the day It is to be remembered always that a new standard has been set up The time has come when every effort will be judged and every activity measured in terms of its value to people The present cry for the socialization of government, the socialization of medicine, and the socialization of industrial and economic forces is no more than an effort to reflect everything against the screen of human relations Pharmacy cannot escape It, too, must be measured in terms of its social significance

I make these observations as supporting my belief that pharmacy has suffered because no effort has been made to fully understand and evaluate it Failure to understand it has resulted in a failure to adopt and follow through a sound and workable policy of thought and action At no time has pharmacy coolly and deliberately set itself to the task of working out its problems, and directing its aim to some definite objective Questions have been considered largely in their own setting, and with no regard to their bearing upon larger and more basic things It seems to me that pharmacy has been content to live for the moment There has been too much of a disposition to accept things as they apparently were rather than dealing with them in terms of actuality Many times pharmacy has been

swept into positions utterly inconsistent with its real purpose Such a policy, or rather the lack of one, has brought our calling close to professional extinction and on the verge of economic ruin We too often have fallen a prey to our nightmares, and have been controlled by conditions created by our own folly

As a result, every possible incongruity has grown up As pharmaceutical education has advanced, there seems to have been a corresponding slump in professional morale Pharmaceutical legislation has not controlled unethical practices, and the economic side of the drug store is in a deplorable condition No relationship exists between the needs of the public and the number of drug stores Drugs and medicines are sold in every type of retail outlet Everywhere and on every hand is shown the results of a failure to meet our problems in a fearless and intelligent manner

I, therefore, urge that every effort be made to complete a social study of pharmacy I feel that real progress cannot be made until the facts are fully known Such a study would furnish the basis for a more definite and practical educational program It would answer all the questions underlying legislation It would put at rest all questions arising from a lack of understanding of the real factual situation It should be regarded as one of the major objectives of pharmacy, and should be undertaken and completed as promptly as possible

The time has come for the ASSOCIATION to take the lead in an organized effort to more sensibly restrict the distribution of drugs and medicines to registered pharmacists The conditions which now prevail are a reproach to our profession It should be plain to all that the public will be better served and more safely served by placing the responsibility squarely in the hands of those whose training and experience fit them for this professional function There is no justification, commercial or otherwise, for permitting such dangerous products to be indiscriminately and promiscuously sold

However, the field is a difficult one, and must be approached after a careful survey of all of the factors involved First of all, the court decisions, holding restrictive sales unconstitutional, should be carefully analyzed It must be apparent that no legislation will stand court action that does not meet the objections raised by these judicial decisions There are long-established principles of law which must be recognized in this matter, and the legislation must be drawn so as to conform to them I mention this phase of the subject because, at the outset at any rate, the whole thing must be approached from a legal point of view

This is no place for experimenting or for following out individual views Most of the efforts which have been made to restrict sales have been ill advised, and the legislation proposed, in by far the larger number of cases, open to serious legal criticism

The point to be borne in mind is that all efforts which are not legally and economically sound do much more harm than good About the only contribution they make is to irritate and solidify the opposition Already there is an effort being made, on a nation-wide scale, to organize all other dealers so that the present situation may be continued There are large commercial interests traditionally opposed to permitting pharmacists the exclusive distribution of drug products These interests are powerful and resourceful Nothing but the most carefully thought-out plans have the slightest promise of success The whole thing calls

for the services of informed and careful men There is no place for the novice and enthusiast

From the very outset, the ASSOCIATION has contended that drugs and medicines should be made available only through competent pharmacists It has consistently opposed the doctrines that they were mere articles of merchandise, to be bartered and sold, subject only to the rules of the market place In 1853, the ASSOCIATION made this historic pronouncement "The first step to improvement is that storekeepers in boroughs and towns shall relinquish the sale of drugs, medicine is merchandise, and something more, to sell it in a common country store is to make it merchandise only" Drugs and medicine have no purpose other than meeting the demands of public health They are merchandise in only a most incidental manner They should be distributed only by pharmacists whose training, experience and sense of responsibility fit them for this important duty

Too much time has already been lost, and the time for aggressive action has come I recommend that the AMERICAN PHARMACEUTICAL ASSOCIATION reaffirm its time-honored position that drugs and medicines should be distributed by registered pharmacists only, and that a carefully selected committee be appointed to draft a model act to bring this condition about in every state

There is a growing feeling that the whole body of pharmaceutical legislation is in need of a thorough revision There is no doubt that much of it is obsolete and expressive of conditions and theories of fifty or more years ago In structure, scope and basic principles, it is hopelessly out of step with the times It still reflects the period when the handling of drugs and medicines was a purely merchandising and commercial transaction These laws do not, as a rule, recognize broadly the great advances made in pharmaceutical education They are based upon commercial practice rather than upon the public health service which pharmacy renders The exceptions and exemptions in the pharmacy laws are so broad as to amount to a virtual nullification of many of the most important principles in these acts To make matters worse, the exceptions have no logical foundation, and are based on nothing other than a selfish purpose on the part of certain powerful groups in the drug industry who have always insisted that their products be given unregulated distribution There is no need to attempt an analysis of these acts at this moment However, I do desire to express my feeling that the basic philosophy of pharmaceutical legislation should be responsive to current conditions I strongly urge that it be made more aggressive and more in keeping with the spirit and tempo of the times It should be based entirely upon the public health importance of drugs and medicines, and not at all upon purely business or commercial considerations I recommend that the ASSOCIATION give serious study to this matter, and that some agency be set up to study pharmaceutical legislation so that it may be modernized and made consistent with the advances being made educationally and professionally

I want to express my deep interest in the efforts now being made to bring the public health profession closer together Nothing but good can come from such a course In some sections, this has not gone beyond medicine and pharmacy In others, notably in Kansas and the Pacific Northwest, medicine, dentistry and pharmacy have consolidated their influences, and have become committed to the advancement of public health as an organized and official policy The advantages

from such a course are many The program of one will have the endorsement and support of all The various professions will come into more intimate relationship, and a sounder and more mutual understanding is certain to result I urge the pharmacists of every state to participate and cooperate in all such efforts

The movements to make medicine more familiar with the United States Pharmacopœia and the National Formulary are entitled to whole-hearted pharmaceutical support The more medicine relies upon official preparations, the more pharmacy will advance as a professional pursuit This effort should include the students in the medical schools While the medical curriculum has paid little attention to the practical sides of medication, and has sent the graduate out to practice poorly trained in this important subject, there is evidence that the pendulum has begun to swing in the other direction One great medical school has recently placed its department of pharmacology in the hands of a pharmaceutical expert It is to be hoped that this is the beginning of a national trend The more physicians know about drugs and medicines, the more they know of the U S P and N F, the greater their value to the public Pharmacy should cooperate to the fullest possible extent in placing the official standards before the medical profession No doubt, it would be wise to prepare digests of the official products, with due regard to prevailing medical theories, and make them available for wide distribution to medical men This is a work peculiarly within the scope of this ASSOCIATION'S activities, and should be done as promptly as possible With the active cooperation of the Committees on Revision of the United States Pharmacopœia and National Formulary, this should not be an unduly difficult or laborious task

The question of ASSOCIATION membership has become of critical importance During the past year, I devoted much time and considerable expense to efforts for building up membership Literally hundreds of letters were written to persons whose names were furnished by interested persons in the various states The results, as evidenced by new applications, were most disappointing Of course, there are many reasons why this year should not be regarded as an average year In many sections of the country, the depression was most acute Nation-wide drives by other organizations also diminished the effect of my personal appeal However, I am constrained to feel that, even in normal years, the membership cannot be built up by anything less than an organized and systematized effort It almost emerges into a separate ASSOCIATION activity, which goes beyond mere routine It requires the earnest cooperation of the membership as well as the active support of all groups concerned with professional pharmacy If the ASSOCIATION is to adequately represent pharmacy and to speak for it in authoritative tones, it must be given greater numerical support It must be so strengthened that none can assail its position or question its views Professional pharmacy demands the services of a strong national association, and such an association should be given strong and consistent support

I think the ASSOCIATION has not, in times past, seen the advantages of making membership in the ASSOCIATION a badge of distinction Membership in the ASSOCIATION should be synonymous with professional standing It should bring prestige It should be something to which pharmacists would aspire In order that this conception may be realized, I am convinced that membership in the ASSOCIATION should be made more selective It should be based upon merit as a

major consideration If pharmacy is to persist as a professional calling, and pharmacists be accorded recognition as an educated group, it must, in the ultimate, depend upon that relatively small number of earnest souls who refuse to be blinded by the flare and glare of the passing scene In spite of its apparent conflict with prevailing doctrines of social policy, the world will be led back to safety and security, not by the rank and file, but by a few men whose souls have refused to be tarnished by the dust kicked up by the popular hue and cry

In line with this thought, a determined effort was made to bring the ASSOCIATION directly to the attention of all the graduates of the colleges of pharmacy in this country in the past few weeks Through the fine cooperation and courtesy of the deans, lists of the prospective graduates were furnished To each of these was sent a note of congratulation, and a dignified invitation to become members of the ASSOCIATION These invitations were signed by the president, secretary and chairman of the Council I do not know how successful the effort may be, judged only by the number of applications, but I am convinced it should be made a regular ASSOCIATION activity, and I so recommend The response of the colleges was most inspiring Nearly every dean expressed the feeling that the effort was most timely

As a wider plan for membership on constructive and basically sound lines, I suggest, first of all, that the colleges of pharmacy be asked to award a certain number of memberships a year This number should not exceed eight in the larger schools, and proportionally in the smaller ones These memberships should be awarded on the basis of scholarship considered in connection with whatever factors the schools should see fit to include In making this suggestion, let it be understood that I am fully aware that pharmaceutical education has given loyal support to the ASSOCIATION I am merely asking their continued support so that each year the best of their graduates may come into the ASSOCIATION It is my thought that the wider the influence of the ASSOCIATION, the greater the prestige of the schools, and the more worth while the profession As a matter of information, it should be stated that a number of colleges have been awarding such memberships for a number of years In these institutions, the memberships are given in reward for scholastic standing, and have proved an incentive for higher scholarship

I also strongly suggest that each pharmaceutical association be urged to cooperate in a similar manner The larger associations might well be asked to grant ten memberships, and the smaller ones accordingly These state memberships in the A PH A should also be based upon some meritorious qualifications Simply as indicating the basis of the awards, I suggest that those obtaining the highest marks in the State Board of Pharmacy examinations be recommended for membership

The State Boards of Pharmacy might work out a similar plan as well I can see some advantages from awarding membership in the A PH A to the one making the highest mark in the examinations It would be a recognition of merit, and might stimulate increased interest in the prospective registrant It may be said, of course, that the funds of the boards are public, and thus not available for such purposes I believe it can be shown that contributing to those agencies engaged in the betterment of professional practice is well within the letter and spirit of the pharmacy acts

I also urge that the attention of the pharmaceutical press be directed to the importance of building up the membership in the A PH A along constructive lines I believe each pharmaceutical publication might find it desirable to award membership in the ASSOCIATION to those contributors presenting the best articles during the year Simply as a recognition of merit, such a plan might well raise the standard of much that appears constantly in the press

In addition to these suggestions, I think it high time the ASSOCIATION took notice, officially, of the vast amount of material appearing in the pharmaceutical press Week after week, month after month, year after year, the press grinds out millions of pages of pharmaceutical interest These publications present the stuff from which pharmaceutical opinion is crystallized, and out of which is constructed the current pharmaceutical policies

We have been woefully wasteful and neglectful in this particular No effort has been made to influence pharmaceutical journalism, or to move it in the right direction It represents a vast power for good, and yet, so far as we have been concerned, it has been no more than a moving current which soon becomes no more than water over the dam The force, power and significance of the pharmaceutical press should be recognized by the ASSOCIATION, and some basic attempt made to have it serve, broadly and constructively, the great objective toward which we aspire

In order that the press may be stimulated to finer service and higher ideals, I recommend that the ASSOCIATION award a medal, yearly, to that publication meeting a certain standard of excellence There is no reason why this medal should not become to the pharmaceutical press what the Pulitzer prize is to the great daily press It should be awarded for merit, and for the general excellence of its presentation The award should be made a pharmaceutical occasion, comparable in importance and dignity to the Remington Medal award

Now, just how, and by what means can these membership plans and suggestions be worked out? I have given careful thought to this matter I have canvassed the whole pharmaceutical field, and, after every effort, have come back to this conclusion There is no group in American Pharmacy more able and better qualified to work out these plans than the former presidents of this ASSOCIATION These men represent maturity in judgment, and a wide and varied experience They embrace, in an unusual degree, the essentials of leadership They measure up to a high educational and professional standard They have been in close touch with the ASSOCIATION'S affairs, and know its needs and objectives Geographically, all sections of the country will be recognized, and virtually all branches of pharmacy It is my recommendation that the former presidents of the ASSOCIATION be formed into a permanent body to be styled, the A PH A Commission on Membership and Awards This commission should organize by the election of its own officers, and should be given a permanent place in the American Institute of Pharmacy, and given adequate financial support as soon as this can be done

In making this recommendation, I am mindful of the fact that the past-presidents may feel that they have earned the right to retire In answer, let me state that they have been greatly honored by this ASSOCIATION and that this alone is sufficient to place additional burdens upon them But my recommendation is based upon an honest conviction that they are the best qualified for this highly

important task Upon its success may be said to rest the future of the ASSOCIATION I urge them to join hands in this new endeavor

In conclusion, let me pay my deep personal tribute to Doctor Kelly and Editor Eberle for their untiring efforts in behalf of this ASSOCIATION Only those permitted to work intimately with them can know their fine loyalty, their inspiring devotion, and the high ideals they bring to their tasks Pharmacy, in its widest phases, has cause for congratulations because of the earnest work these men are carrying on May they live long, and enjoy the blessings of good health and happiness!

To the ASSOCIATION and its membership, collectively and individually, I express my sincere thanks for the confidence and trust reposed in me To head this great ASSOCIATION, even for a brief period, is to enjoy the greatest distinction within the power of pharmacy to bestow To have been thus honored at your hands will ever remain my most cherished memory

---

ADDRESS OF THE CHAIRMAN OF THE HOUSE OF DELEGATES

BY P H COSTELLO

To the Members of the House of Delegates of the American Pharmaceutical Association

A welcome opportunity, it is for us who are interested in the welfare and progress of American pharmacy, to figuratively join hands once again at this annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION here in Washington

Members of a great profession devoted to the service of humanity, we, who are gathered here, hold a keen interest in national developments not only as they affect us as patriotic and loyal American citizens but, and naturally so, as they touch upon the course of our own profession Representing individual pharmacists in this changing order our ASSOCIATION must do its part Let us hope, therefore, that this meeting in our Capital City will bring about a better appreciation and understanding of the value of Pharmacy and the great purpose it serves

We can now point with a great deal of pride to our headquarters building, *The American Institute of Pharmacy*, located in this city It is a monumental achievement It is entirely fitting and appropriate that an organization, such as ours, should have as its headquarters a building such as this, and it is also proper that it should be located in the Capital The past several months should show the wisdom of the new location of our headquarters because events, which affect all of us, have been happening daily here in Washington with lightning like rapidity Any other location would have proven a mistake and a handicap to our future welfare and progress

It is a privilege, possibly it may become a distinction, for those who have availed themselves of this opportunity, to be present at the dedication of our building during this convention The founders of the AMERICAN PHARMACEUTICAL ASSOCIATION intended the organization should carry on Possibly they visualized some of the progress and achievements that were to come, but it is hard to assume

any one of them ever dreamed of an organization such as we now have with a headquarters building of our own in this city It should be an inspiration to us, but probably more, and let us sincerely hope so, that it may prove to be the beginning of a new era for Pharmacy This will depend upon ourselves

It has been said, and the statement remains unchallenged, that the AMERICAN PHARMACEUTICAL ASSOCIATION has promoted the highest principles of professional pharmacy for more than eighty years In this regard, it is our good fortune the organization has succeeded in a fair measure to accomplish what it set out to do To rest on our oars now, satisfied with the accomplishment thus far, would gain us nothing Nor can we long continue to maintain the prestige of our profession unless we are guided by past experience and make it possible for ourselves to render a greater service in the future

At present we find many conflicts of thought, ideas and endeavors among pharmacists, evidenced most notably by their public expressions What is more significant is the extreme differences of their opinions and viewpoints Ours is a very complex profession when one considers all phases of pharmacy and pharmaceutical activity Whether we are to strive for the higher professional attainments alone, or whether we shall seek to bring all the conflicting groups together for a more united and stronger pharmacy under one association, the future will decide Any program that is not all-inclusive, or neglects the welfare of some, will fail

P H COSTELLO

During the last few years we have been led to believe that a large majority of the more than fifty thousand drug stores in the nation have suffered from one cause or another It is not strange at this time that a majority of retailers are mostly concerned with their economic welfare, fair trade practices and profit Codes and commercial problems are their first concern and their plight cannot be ignored by any organized group of pharmacists Upon their success to emerge from their dilemma depends not only their own welfare, but also that of many more employed pharmacists The failure to stabilize retail pharmacy will result in its downfall

Even between the separate national organizations, there must be cooperation There can be no distinction or classification in Pharmacy One may be able to render a higher type and a more skilled professional service in an exclusive prescription laboratory than is possible in some remote area in an ordinary drug store Just as those employed in the first instance are especially qualified and equipped, the owner of a pharmacy in the remote region may not be Yet each renders a pharmaceutical service, and the service rendered by the latter may be quite as valuable to those depending upon him as in the former case We may adopt minimum standards for equipment, as we have adopted minimum qualifications for pharmacists and minimum standards for drugs, but such a forward step should not deny any community the type of pharmacy it can support and maintain

I desire to quote from a tribute paid to pharmacists by the Governor of my state in his last Pharmacy week proclamation

' This is a profession which quietly, and without what we know in our modern vernacular as 'ballyhoo,' has devoted itself to the preservation of the nation's health, the profession which numbers among its followers some of the real heroes of contemporary history

When I say heroes' I mean the druggist in the little Arkansas town who was called upon by his fellow citizens to join them in taking to the hills, while the flooding waters of the Mississippi swirled on the floor of his store This druggist's answer was to move his medicines to the higher shelves and lay a new floor composed of boards laid from counter to counter The people needed medicines and he stood by, preserving them from the greedy river

I mean the pharmacists, numberless, who during the great 'flu' scourge, abandoned sleep to stand unseen in the back of their stores to fill the unprecedented rush of prescriptions There is no doubt but that a great number of them sacrificed not only health, but life, in so doing

I mean also, and perhaps with even warmer gratitude, because I have been closest to him, the small town druggist who has helped so materially to build up North Dakota, the kindly citizen who stands ready to do any thing, from dispensing cough syrup to giving ether while the country doctor performs an emergency operation

Millionaire philanthropists are lauded in headlines every time they part with one of their many millions to endow a college or camp Some day, I hope to see in the biggest, blackest type there exists a list of those pharmacists whose fortunes were slowly, unspectacularly, dissipated in the form of little bottles of cough syrup and croup vaporizers to save the lives of babies whose parents were too poorly paid, and often too harassed to even give thanks "

Among the delegates to this body, and members in attendance at this con vention, are most of the leaders of Pharmacy I am confident they have given, and will continue to give, their best in a fearless and sincere effort to carry out a sensible policy and program that will enable Pharmacy to progress And may each one of us take home with us from this convention something of value to our state and local associations

In closing, I want you to know I am not unmindful of, nor ungrateful for the honor and privilege you have bestowed in permitting me to serve as Chairman of the House of Delegates this past year I deeply appreciate it Thank you

---

ABSTRACT OF PAPER, SCIENTIFIC SECTION, A PH A

Further Studies on Psyllium (illustrated with lantern)," by H W Youngken

Plants with mature fruiting spikes and seeds were obtained by the author from growers of commercial Psyllium seed in Spain and France identified by comparison with authentic herbarium sheets and authoritative descriptions in the literature The seeds were separated from these and compared with commercial lots of Psyllium on the American market, thus permitting certain identification

The seeds of *Plantago Psyllium*, *Plantago arenaria* and *Plantago Cynops* are compared as to physical characteristics, histological details, relative weight and mucilage swelling capacity

It was found that most of the samples of commerical Spanish Psyllium examined by the author were yielded by *Plantago Psyllium*, a few by *P arenaria*, that most of the recent French Psyllium samples were yielded by *Plantago arenaria*, a number of *P Psyllium*, while occasional lots represented varying mixtures of *P Psyllium P arenaria* and *P Cynops* It was also ascer tained that the seed of *Plantago lanceolata*, described by the author in a previous article is being offered to the American trade both as Spanish Psyllium and German Psyllium as well as torrefied abroad and mixed with untorrefied seed of *Plantago arenaria* and offered in this combination to the French and American trade as French or Black Psyllium Seed

ADDRESS OF THE PRESIDENT OF THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY

BY C THURSTON GILBERT

Mr Chairman, Members of the National Association of Boards of Pharmacy and Guests

It is my duty and also a pleasure to address you as your president on the thirty-first anniversary of our Association This honor befalls few men and comes but once during the span of life

We are privileged to meet in the greatest Capital on earth, the city that has imbued one hundred and twenty million people with hope of a *New Day* and a *New Deal* Washington is the one city that every American longs to visit The historic, scientific, governmental, judicial, political and economic phases of our daily life are all exemplified here We are particularly fortunate to meet in Washington at a time while Congress is in session, which presents the opportunity of witnessing its activities from the galleries of the House and the Senate

C T GILBERT

It is customary for the president to present to the membership an outline of the activities of our Association for the year entrusted to his stewardship It has been my endeavor to carry out these duties and responsibilities in a manner that would best serve our Association I hope in this particular that I have given satisfactory service My administration has been short, owing to the change in the convention date Therefore, I shall not burden you with a lengthy address but shall confine myself to the more important matters only

AMERICAN INSTITUTE OF PHARMACY

On Wednesday morning the pharmacists of this country will dedicate the greatest monument that has ever arisen to glorify our profession After many years of careful study and planning, Pharmacy now has a *Home*, truly representative of our profession and of which we may be proud—a source from which our centralized efforts in the future may emanate It will be the high privilege of those present at this convention to witness the dedication of this temple of Pharmacy

ASSOCIATION ACTIVITIES

For several years past, our organization, not unlike other associations, has been confronted with a lack of capital to carry on the several activities which we had undertaken to keep pace with the rapidly changing conditions affecting pharmaceutical education and registration We have had to curtail some of these activities until the economic situation returns to normal We all feel that this time will come soon

Like individuals, business men and other associations, we have had to readjust ourselves to a greatly reduced income During the past ten months, we have demonstrated that this can be done, for we have carried on the most essential activities without drawing on our capital account From present indications, we shall close our fiscal year on June 30th without a deficit The reports of the Executive Committee, the secretary and the treasurer will give you the details We have had to leave some things undone that I should have liked to have seen done but, in common with the rest of the world, we are learning some valuable lessons

More of the business details will be covered in the report of the Executive Committee by Chairman W M Hankins The mid-year meeting was again omitted, the annual meeting of the Committee being held here in Washington just prior to the opening of this convention

No association can function successfully as a national organization through its officers alone Although this has been a short year, your president has found little time for anything else than the affairs of the Association However, at this time, I wish to pay special tribute to the many Committee chairmen, District chairmen and fellow officers for the loyal and whole-hearted cooperation that they have displayed It is this loyalty and this devotion that has made the N A B P one of the outstanding organizations in Pharmacy

DISTRICT MEETINGS

My first thought in assuming the presidency was to impress upon the membership the necessity for and importance of district meetings The loyal response which I received from the vice-presidents in response to my appeal for meetings has been most gratifying to me Eight of the nine districts promised a meeting for this year, and these meetings would have materialized were it not for the fact that the early date for our annual meeting upset the plans of several of the districts that had made plans for meetings in April or May These plans were abandoned so as not to interfere with convention attendance

On March 12th and 13th, I had the pleasure and good fortune of attending the meeting of District No 2 in Baltimore, and on March 14th and 15th, the meeting of District No 1 at Boston Certainly no person who listened to the programs developed at these meetings could be otherwise than impressed and encouraged by the high purposes and aims of these meetings

On March 21st and 22nd, District No 6 held a meeting at Fort Worth, Texas, on March 26th and 27th, District No 7 met at St Petersburg, Florida, and on April 16th and 17th, the first meeting of District No 8 since 1924 was held at Salt Lake City, Utah

One of the encouraging things about these meetings is the ever-increasing numbers who attend Each year the interest manifested in these meetings swells the attendance record to a new high point

LEGISLATION

Comparatively few state legislatures were in session In addition to the few regular sessions, there were a number of extraordinary legislative sessions

The primary aim of this Association in so far as legislation is concerned is to have the pharmacy law of every state in our nation require college graduation for entrance to board examinations It has taken nearly thirty years of patience to achieve the high standards under which we now labor, and at this time only eight states have not as yet enacted college requirements We should therefore lend every effort to assist these member states in enacting this very necessary and desirable legislation

Other states have college prerequisite laws that are not satisfactory, as they require only a year or two of attendance at a recognized college instead of graduation from the four-year course now prescribed by the Syllabus These states should also endeavor to amend their laws as soon as is expedient

In the past, we have had success by setting a certain date as the goal when a certain thing shall be accomplished

> *Therefore,* I recommend that every member board at present without a college *graduation* requirement immediately and seriously undertake to work for the enactment of such legislation, setting the year 1940 as a goal when every board shall be operating under a compulsory graduation requirement

Again it is the duty of the president to remind the membership that there are forces constantly at work for the consolidation of boards of pharmacy with other professional and even occupational boards into licensing departments or bureaus This type of legislation should be fought vigorously by our boards when it is proposed, also soliciting help from the other professions that are involved In states where consolidation has already been accomplished and is not functioning satisfactorily, every effort should be made to separate the Pharmacy Board from such ties Protection of the public welfare is the first duty of the Pharmacy Board and when the system under which the board is operating places the public welfare in jeopardy, then it becomes the duty of the board to call attention to the condition so as not to become a party to the act

The N A B P having gone on record as favoring the abolition of the grade of *Assistant Pharmacist* certificate should take a further forward step by outlining a definite plan for accomplishing this Strong opposition should be made to any attempts to grant a higher grade of license to assistant pharmacists by legislative amendment than that originally intended "Professional service cannot admit graded responsibility"

> *Therefore,* I recommend that the Legislative Committee be instructed to make a study of the problem of abolishing the assistant grade of certificate under the various state laws and present a definite outline or uniform plan for accomplishing this, without granting to the holders of outstanding assistant licenses any privileges other than those originally conferred by the law

RECIPROCITY

Each year the president devotes some time in his address to this subject And the theme is usually *Tolerance,* as it rightly should be The benefits of reciprocity have again been proved this year by the slow but steady increase in the

number of applications issued, thus providing pharmacists with an opportunity to practice their profession under more favorable conditions and habitats during these changing times of economic readjustment

Possibly at no time during the existence of the N A B P have more friendly relations between the member boards prevailed Reciprocity is in effect between all the states except California and New York, also with the District of Columbia, Alaska and Puerto Rico—a total of 49 active member boards Inasmuch as both New York and California are college prerequisite states, they should become active members of the N A B P May these two great states, separated by the broad expanse of our country, soon answer the call and join with us in our problems and joys Our responsibility is to make every effort to get them to join the ranks of this great *National Association of Boards of Pharmacy*

PROFESSIONAL PHARMACY

It has been decreed, and properly so, that Pharmacy shall be classified as a profession Certainly the work as taught in our colleges is professional Now that we demand four years of college and offer a degree in science in Pharmacy, the time has come to develop a wider field of professional practice

We are all familiar with the complaint that there are too many commercialized drug stores and that the graduate has difficulty in finding employment in profes sional pharmacies May this condition not be due to the fact that for many years we have been registering as pharmacists persons whose only credentials were four years of training in a more or less commercial store? The very fact that our graduates are looking for professional openings is an indication of what we may expect in the future I therefore feel that this Association in cooperation with the AMERICAN PHARMACEUTICAL ASSOCIATION should lend them encouragement by making every effort to develop more professional pharmacies The strictly pro fessional pharmacy is already flourishing in the larger centers But we need the same type of pharmaceutical service in the smaller centers which cannot support it without adding some commercial lines If a high standard of professional service is rendered and stressed, there can be no harm in limited merchandising of allied lines The N A B P has an opportunity to perform an important service for both phar macy and the public by defining and designating pharmacies that can be safely entrusted to render such service

PHARMACY EXHIBIT CENTURY OF PROGRESS

Pharmacy received its major publicity of this age the past year at the Century of Progress in Chicago This exhibit was visited by millions of people from every corner of the globe and was invaluable in stressing the service pharmacy renders in the field of public health The exhibit is to be continued in 1934 and its value further extended

This Association should feel particularly proud that the man whose efforts made this exhibit such an outstanding success is one of its officers Mr Christen sen has already been honored for his work in behalf of the exhibit but will receive greater mention as the years go on and the value of the exhibit is realized Every pharmacist in America owes it to himself and to his profession to visit the exhibit before the Century of Progress passes into history

HOME OFFICE

Those members who have not visited our home office should avail themselves of the opportunity whenever possible Only those who have done so can visualize and appreciate the amount of work that is handled there each day and the competent and efficient manner in which thousands of inquiries are dispatched The home office is a place where all of us have access to statistical data on all phases of the profession which it has taken many years of labor and study to compile The information is available to those who ask for it

The personnel is of the highest efficiency and can at all times be depended upon to give the maximum of service They are to be commended for the work they are doing for Pharmacy and the Association

IN MEMORIAM

Each year it becomes the sad duty to report the names of our beloved members that have laid down their tools and answered the call of Him who reigns in the place from whence no man returneth Death must come to all of us During the past year, the following members have passed into the Great Beyond

Thomas C Coltman, Colorado
Oscar C Draper, Delaware
John E Jackson Virginia

CONCLUSION

I now wish to express my deep appreciation to you for conferring upon me the highest honor within your power to bestow—the presidency of the National Association of Boards of Pharmacy

I have tried to serve you in a manner that would reflect credit upon the Association which is nearer to my heart than any of the multitude of bodies with which I am affiliated

If I have been successful in only a small way and have contributed something to the upbuilding of the N A B P , I shall feel well paid for my efforts

To my successor, I wish a full measure of success and happiness, and I pledge him my loyalty and support in his administration of this high office

To-morrow, when I lay down the gavel of office and return to the ranks, I will deem it a pleasure and a privilege to continue to work for the lofty ideals of the National Association of Boards of Pharmacy

---

ABSTRACT OF PAPER PRESENTED BEFORE SCIENTIFIC SECTION A PH A , WASHINGTON MEETING 1934

"The Stabilization of Syrup of Ferrous Iodide U S P X ' by William J Husa and Lyell J Klotz

A study was made of the mechanism and rate of decomposition of ferrous iodide solutions and syrups The decomposition involves a partial hydrolysis of ferrous iodide oxidation of iodide ion and oxidation of iron The oxidation of iodide ion was found to be a reaction of the first order with a specific reaction rate of $3\,2 \times 10^{-5}$ An intensive study was made of the deterioration of Syrup of Ferrous Iodide U S P X It was found that a stable syrup may be prepared by using dextrose in place of sucrose

ADDRESS OF THE PRESIDENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

BY L D HAVENHILL

Last August, in Madison, when you chose me as the recipient of the highest office that this Association has to bestow, I can assure you that no one could have been more surprised than myself

To serve as your president has been not only a great personal honor, but also an honor to the school which I represent I desire at this time to express my appreciation of the hearty support that the members and officers of this Association have given me during the past year

In accordance with the provision of the constitution of this Association that the president shall present an annual address, I have chosen as my subject, "The Education and Training of the Modern Pharmacist"

Thirty-four years ago to-morrow, May 8, 1900, the founders of this Association, numbering twenty-one charter members, met in Richmond, Virginia, and organized the American Conference of Pharmaceutical Faculties Ten years later, in May, the Conference again met in Richmond, five members stronger at the end of the decade than at its beginning Ten years later, also in the month of May, we met for the first time in the city of Washington At this time our membership had increased to forty-five In 1930, May was again chosen as the month of meeting, but this time Baltimore was the favored city Our membership had increased to fifty-seven

L D HAVENHILL

Now, after four additional years of rambling, we are, after an absence of fourteen years, assembled in the city of Washington for the second time Our membership still numbers fifty-seven, which, considering the four trying years, I feel augurs well for the continued development and stability of pharmaceutical education

I am glad that it is our good fortune to be in the nation's Capital again in this glorious month of May For somehow, whether cold or rainy, or radiant with the warmth and gladsome sunshine of Spring, May outstrips all of the other months of the year as an auspicious time for annual reunion

We have come back to a new and more beautiful city of Washington and fortunate indeed are we who are privileged to attend this thirty-fifth annual meeting and witness the dedication of the now realized dream of American Pharmacy—the American Institute of Pharmacy

As we look back through the vista of more than a third of a century, we are saddened to note the rift in our ranks caused by the passing of so many pioneers and early workers in the cause of pharmaceutical education If my information is correct, Dr Edward Kremers is the only member now with us who was present at

the memorable first meeting in Richmond, Virginia, thirty-four years ago, who has maintained an uninterrupted directorship of a member college Time has whitened his hair but has made no impression on his indomitable will and purpose to carry forward the campaign for a finer and broader pharmaceutical education which he began so long ago

After many years of aggressive planning this Association has finally reached a place in its educational program upon which truly to build a profession of pharmacy The minimum four-year course is at last a reality and I believe has come to stay permanently in one form or another While the development of the four-year course has been slow, its progress has been steady In 1927, at the time of its adoption, few, if any, of our members anticipated the financial situation that we would be facing in 1932 Many readjustments have been necessary and one might be pardoned for believing that 1932 was an inopportune time for the inauguration of this important step in our program of educational expansion

We are in the midst of a world depression and by way of depressing you still more you may recall that I sent you a questionnaire, not too lengthy a one I hoped, to answer I should like to consider with you for a few minutes some of the answers to the questions which I here propounded Let me first thank you and say that the responses I received were unusually prompt, frank and complete Such a response is remarkable and can only mean that those in authority appreciate the meaning of cooperation and are willing to give their time in whatever way appears to be helpful to the Association

The replies to the first part of Question 1, "Has your school been seriously handicapped by diminished financial support?" were as follows eleven, yes, fifteen, to some extent, twenty-eight, not seriously District No 9, the Pacific Coast states, as a group were the least affected, all reporting that they were not seriously handicapped

The replies to the second part of this question, "If so, how have you met this situation?" indicate that the condition has been met to a great extent by salary reductions ranging on the average from 8 to 20 per cent but in some cases reaching 50 per cent Strict economy is being practiced and many items from the customary budget such as traveling expenses, advertising, special printing, library funds, research, new buildings, special apparatus, assistants, etc , have been either greatly reduced or eliminated In a few instances the decreased salary budget has necessitated dropping some junior members from the faculties Compensating factors have been funds and equipment in reserve, gifts, increased tuition and to some extent decreased enrollments

Many of the schools reported that their resources were diminishing and that drastic retrenchment would be necessary if present conditions were to continue over a period of several years With the decided upward trend in the cost of laboratory necessities now manifest, this concern may become real, indeed, to all the schools It is perhaps timely for an older member, for whom this is not the first depression, to remind the younger ones that many wonderful achievements and many brilliant scientists in the past have issued from laboratories in which the equipment was meager indeed Necessity, said to be the "mother of invention," may in the near future develop some talent in our student-body which otherwise would perhaps have lain dormant

Inspiring and resourceful instructors will triumph over whatever befalls A striking feature was brought out in these replies, that I believe illustrates in a vivid way the professional spirit of pharmacy, a spirit that one could wish was more in evidence elsewhere in the world to-day, was that the faculty members in general accepted deeper cuts in salary in order that funds might be available to secure essential equipment and instruction for their students

One of the most serious situations that may arise in the larger institutions of learning will be an attempt at reorganization under the guise of economy in which the school of pharmacy will be merged with other larger schools or departments and thus be deprived of its autonomy and professional organization Some six or more schools have already changed or are contemplating changes in their organization It is to be hoped that none of these will result in conditions that will be inimical to the best interests of pharmaceutical education A recommendation, therefore, is offered to the effect that this Association view with disfavor economies of this kind and that the chairman of the executive committee register vigorous protests to any and all instances of this character

A classification of the replies to Question 2, "If you have suffered a decrease in enrollment, especially of freshmen, in the past two years, to what do you attribute it?" indicates that thirty-four schools had a decrease in enrollment amounting to 30% or more in some instances Eight schools had maintained their freshman enrollment and twelve schools had an increase in freshman enrollment, especially in 1933 In some cases this increase was more than 100%

The depression was generally blamed for the decreased enrollment, but local conditions, increased tuition, acceptance of only approved high school graduates and lack of full support by the respective boards, were also causative factors

It was inevitable that the four-year course should be held responsible to some extent, especially when the increased length of the course is considered in the light of unfavorable business outlook, and the financial embarrassment of prospective matriculants However, only six schools believed that it was more than indirectly responsible and sixteen schools reported specifically that as a causative factor it was negligible

The answers to Question 3, "Is there active opposition to the minimum four year course in your state and if so, from whence does it emanate?" should be received by this group with considerable satisfaction Forty schools report no opposition Several of the schools that adopted the minimum four-year course prior to 1932 report that they are now actively supported by the pharmacists and the boards This should serve to encourage those schools that did not adopt the minimum four-year course until 1932 and that are at this time facing the expanding curriculum with decreased enrollment and a decreasing income Fourteen schools report some active opposition from board members and individual pharmacists who seek pharmacy only as a trade, also from financial backers and alumni of some competing schools whose standards are below those of the A A C P

The replies to Question 4, "From what sources do you encounter the greatest inertia in the operation of the minimum four-year course?" indicate that the program is neither wholly nor graciously accepted by druggists who might be characterized as follows Those who fear they will have to pay more to their clerks, those who have no appreciation of the value of an education, those who have failed

to note that the apprenticeship system began to lose its effectiveness one hundred or more years ago, and from the "has-beens" of the non-professional type

The response to Question 5, "Kindly give me all the information possible concerning 'cram schools' and other schools having requirements for entrance and graduation below the A A C P requirements, that are functioning in your state or immediate territory," indicates that there are a number of the so-called "cram" schools still functioning They necessarily derive most of their support from the states where only drug store experience and the ability to pass the board examination are required of registered pharmacists There are now, according to report, only eight states without a college prerequisite (Arizona, Massachusetts, Missouri, Nevada, New Hampshire, New Mexico, Tennessee and Vermont)

Recent printed matter issued by one of these "schools" in the Middle West, states that it has enrolled more than five thousand students since 1910, one thousand of whom were enrolled between 1929 and 1932 The explanation for this sharp rise in the attendance curve is that most of the boards in the district have announced a college prerequisite to take effect in the near future It is reported that this school is a one-man, one-room institution without equipment, term six weeks, tuition one hundred dollars payable in advance and non-returnable

There are ten schools listed in Guidance Leaflet No 14 which are not members of the A A C P, and a private school and college directory lists a score or more additional ones Apparently, there has been but little change in the total number of pharmacy schools since the list compiled by Prof W L Scoville and published by the American Conference of Pharmaceutical Faculties, in 1905

That there should still be schools that do not meet the A A C P standards, offering pharmaceutical instruction in any of the states is indeed unfortunate for professional pharmacy Surely the supporters of such instruction have given but little serious attention to the mass of material collected at considerable expense in time and money and rendered available as *Basic Material for a Pharmaceutical Curriculum* The material in this book ought not to be restricted to curriculum builders It is valuable for every one who believes in professional pharmacy and wishes to encourage it There should be a copy of this book in every drug store—at least 65,000 copies, readily available for study and reference—but the fact is that after seven years less than 1% of this number are in use

When the question of adopting the minimum four-year course was before this Association in 1928, numerous advantages were argued for and against it Those schools which had already adopted this course were unanimous in their endorsement To ascertain, if possible at this early date, if opinions had changed, Question 6, "What are the advantages so far gained by the four-year course?" was submitted Forty-six schools reported distinct advantages, two reported that it was too early to offer an opinion, one saw no advantage so far, one reported a distinct disadvantage, but without comment, four did not report

A few of the more frequently mentioned advantages were time for more thorough work in each course, better morale, the broadening outlook, better sequence of a study, students show more of a professional attitude, a standard instead of a substandard course, fewer transfers of students to other courses, pharmacy has been dignified in university circles, fits students for a wider service

Several deans, who had previously questioned the advisability of the mini-

mum four-year course, freely admitted that they were completely won over to the new program The combination of college education and professional training is meeting with general approval One dean, who is regarded as a pioneer in the field of higher education, writes, "The principal advantage we have found growing out of our minimum four-year course is the increasing recognition—even among our conservative pharmacists—that pharmacy needs men of better training, caliber and character "

Questions 6*a* and 6*b* were submitted particularly because of their bearing on two important advantages that it was hoped would be gained through the adoption of the four-year course To the first part of this question, "Have better qualified students matriculated?" thirty-eight deans answered yes, in positive terms, nine answered no, without comment, five qualified their answers in such a way as to indicate that their matriculants in former years had been well qualified and two expressed no opinion

The answers to the second part of this question, "Has it established an assured feeling of equality with students in other departments?" were as follows thirty three, yes, nine, that the question did not apply because they were independent schools, seven, that this question had not been a problem with them, two, not completely, two, no, but one offers in explanation, "We are associated with five and six-year professional colleges and still are the short term school " Certainly, no more sweeping vindication of the four-year course can be offered than the answers to these three questions

The introduction of the four-year college course in pharmacy, I fully believe marks the greatest and most important forward step in pharmaceutical education that has taken place in the last quarter of a century I say this in a very emphatic and positive way and see no reason for modifying this statement in any particular There are numerous reasons for believing that this is so In the first place, it definitely elevates pharmacy to the rank of a profession, taking it permanently out of the vocations and class of manual trades Again, it tends to bind medicine and pharmacy into a closer union than has ever before been possible because, in addition to giving the pharmacist a good professional training it provides time for considerable non-professional and cultural study and thereby places the pharmacist virtually on a par with the physician so far as general education is concerned The pharmacist can now meet the physician on a plane of intellectual equality and demand respect for his opinions not only on matters involving drugs and drug therapy but on any of the general problems affecting private, community and national health The first real step in bringing pharmacy and medicine into professional union has now been taken and the consequences of this step, as well as its importance for pharmacy, is well nigh inestimable

A number of deans responded to my general invitation for comments and observations on the four-year course These responses should not remain buried in my files and I wish to present some of them to you as quotations I am indeed sorry that time prevents mentioning more than a few of the excellent replies that I have received

"I am glad we have the four-year course If I had it to do over again I should do whatever I could to promote its cause "

'The four-year course and curriculum as per Syllabus will attract a higher grade of students

who will, on graduation, have a better cultural background, and be more professional minded and, on the whole, a credit to the profession of pharmacy Formerly, only an occasional one would rise to such a high standard, and this was usually due to superior educational background before entering pharmacy school or college

'We are well satisfied with the four year course in this state "

"I realize very thoroughly that a four year course seems to be somewhat excessive considering the kind of stores that possibly the majority of our students will go into after graduation but I believe and sincerely hope that this is one way of raising the standards of pharmacy throughout the state "

'We always regarded pharmacy as the chief medical specialty and have continuously maintained that pharmacists should be educated upon an academic qualification equal to that required by medicine Other professions are now exacting the same previous academic training that medicine requires Our schools of Dentistry Education, Business and Law require the same preparation for their respective technical work that medicine requires of students before they are admitted to medical subjects Why should pharmacy occupy in a university a position inferior to any other school or profession? We feel there is no valid reason and all our endeavors in our struggle for advancement have been based upon that conviction Pharmacy is a division of public health equally important with dentistry and certainly nearly as responsible as medicine That pharmacists should be less qualified than dentists or physicians seems out of the question with us "

"I have a very definite feeling that the establishment of the four year course will result in a much more secure position for the profession of pharmacy both by the laymen and our sister professions of medicine and dentistry '

We knew of course that there would be a few lean years but so far as I am able to determine there is not a man among us who would consider going back to the old system "

I believe that our school has a better standing to day in the state than ever before We are putting on a part of the program for the state convention this year and in fact I feel fairly well encouraged in both the Syllabus and the four year course "

' I am very much in favor of the four year course in pharmacy I believe this will decrease the number of graduates in pharmacy, but increase the qualifications of the graduates I also believe it will have a tendency to instil a greater appreciation in the graduate for his profession increase the professional side of pharmacy and decrease the general merchandising which in my opinion is retrograding our profession at the present time

' Judging from our experience in the last four years I believe that the benefits that have been accrued by graduates of the four year minimum course in pharmacy more than outweigh the difficulties encountered "

The fourth edition of the Syllabus, which is intended to indicate subject matter for use in building the four-year curriculum, has now been available for a little more than a year Each of the preceding editions of this book has served in turn to lead the way for the adoption of longer and broader courses of study This one is destined to bring about greater uniformity and stability Eventually its provisions should be written into the by-laws of this Association to become a part of the qualifications for membership

It must be borne in mind that changes come about gradually and that it takes years of tireless effort to develop suitable and acceptable standards Take for illustration, the U S P which, though revised with great labor every ten years, was accorded no official standing for more than eighty years It will not require so long a time, let us hope, for the A A C P to officialize a Syllabus However, it would seem to be a little premature for the Association to attempt this step until the provisions of the Syllabus have been critically observed during at least one complete four-year cycle

Bearing on this general subject, the next and last question, "What is the re-

action of your faculty to the new Syllabus?" has brought forth many significant replies On the whole, these show that the various faculties are giving the Syllabus careful study Several of the deans have provided each member of the staff with an individual copy The appearance of the Syllabus at the time when the new course of study is being inaugurated has proved helpful in many ways and its merits as a suggestive outline have not failed of recognition This Syllabus, as one member expressed it, "is the best ever and furnishes an excellent preliminary working basis" Twenty-two replies indicated that the faculty reaction to the Syllabus was favorable, twenty were to the effect that some modification would be necessary, eleven reserved opinion

From the comments received, it is evident that further discussion of the courses in the Syllabus is advisable There is a desire to have the list of basic subjects extended to include at least psychology and sociology, political science and more in the English group The advisability of making mathematics and economics required and biological assaying optional was questioned Commercial pharmacy and physical chemistry were suggested as additions to the professional and applied subjects Regret was expressed that outlines for basic subjects were not included No one expressed a desire for the elimination of any of the courses

A considerable number of faculties are experiencing difficulty in adhering closely to the prescribed outlines They expressed the belief that rather liberal modification will be necessary in order to meet local conditions This was particularly noticeable in the replies received from state-supported schools A minimum of revision should make this Syllabus acceptable I would recommend that this problem be assigned to the Committee on Curriculum and Teaching Methods and that this committee be increased from five to ten members

Before I leave the subject of the Syllabus, I wish to express my surprise that the slow sale of this book, reported last summer, still continues Dean Beard informs me that only a small number of the state board examiners have purchased copies The material in the Syllabus ought to appeal to all the members of every state board of pharmacy Here is an opportunity for our faculty members of the Committee on Relations of Boards and Colleges, if they have not already done so, to render service to pharmacy by starting discussions concerning the application in professional pharmacy of the different courses outlined in the book The chapter pertaining to the use of the Syllabus by the state boards in preparing their questions is also worthy of an afternoon or evening's discussion

As has been stated before, the introduction of the four-year college course in pharmacy marks the most important forward step in pharmaceutical education during the last quarter of a century Some very pertinent questions arise which demand judgment and discussion What distribution of time and study is best and wisest during this four-year period? How shall the professional and non professional courses required be related to each other? Can the rapidly advancing junior college movement, which is literally sweeping certain sections of our country, be used to advantage in furthering pharmaceutical education?

Heretofore we have had little occasion to take cognizance of a new educational unit such as the junior college This is a great educational experiment which had its practical beginnings in the first decade of this century The *Junior College Journal* of January 1934 contains a directory showing a total of 514 colleges with

a total enrollment of 103,530 students The Atlantic Coast states have only a small number of these colleges, but in the South and Middle West they are growing steadily in importance There is distinct evidence, also, that this is a healthy growth

About 90 per cent of these junior colleges are accredited in state universities through a committee chosen for that purpose, acting as the accrediting agency The standards to be met are the same as those for the first two years in any high-grade four-year college

The universities directly concerned with junior colleges in their own states have for the most part shown a commendable spirit of cooperation Naturally some of the older universities have been indifferent or adopted the policy of suspended judgment to the whole junior college movement This attitude can be only temporary, however, for the importance of this educational change will soon be felt throughout our entire educational system

The curricula of most of the accredited junior colleges are modeled upon the first two years of university work The junior college period may become an important unit for pre-professional training E D Chadwick, in a survey of the junior colleges of Minnesota, gives a list of pre-professional curricular offerings which includes one for a year of credit in pharmacy schools These junior college graduates are coming to the universities in increasing numbers Many now feel that one year of pre-pharmacal work in a junior college is entirely feasible, but two years of this work has been suggested Can such a plan be successfully carried out? There is reason to believe that it can

A great amount of so-called pharmaceutical education is not professional in character, and institutions other than colleges of pharmacy can impart this information quite as well, perhaps better at times, than can the regular school of pharmacy If the professions of medicine and law find it possible to take advantage of junior college training in fitting their students for later professional study, it would seem that schools of pharmacy were taking themselves all too seriously if they insist that this part of the education of the pharmacist can only be carried out successfully under their direct observation and guidance

The very first requisite of a professional man has always been, and I am quite sure always will be, that he be a liberally educated individual and that in addition to possessing professional knowledge he should also be equipped with broad and extensive non-professional information This is doubly true for the professional man of to-day for only on a broad and liberal foundation of non-professional information can the complex superstructure of modern professional study be built The professions of law, medicine and the ministry, to mention only a few, have come to recognize this as an established fact and are to-day insisting on a long period of general, cultural or non-professional study as a very necessary prerequisite to real professional training in these fields

No professional school can ever hope to teach all that its students need to know in later life College training must seek rather to instruct the student how to read the permanent written record of man's achievement accurately and intelligently and how to proceed from the known to the unknown, once general principles have been laid down and mastered For a well-prepared student there need be no special kind of inorganic or organic chemistry, no English, botany or biology

especially adapted to this or that professional student Subjects such as these are all prerequisites to pharmacy as well as to the other professions and should be so considered A well-equipped junior or university college should be able to teach these subjects quite as well as the very best professional school We should not become too sentimental about prerequisite studies except to see to it that they are given by properly trained individuals Let us make our schools of pharmacy real professional schools devoted strictly to the professional aspects of pharmacy and leave training in the prerequisites to others to carry out

The modern intellectual development of any young man or woman falls quite naturally into two main divisions, *first*, a non-technical, non-professional, so-called cultural part, and *second*, a technical or purely professional part We might very properly divide the four-year course in pharmacy into two equal biennial periods The first period should be devoted to the acquisition of purely cultural subjects together with the necessary prerequisites for later pharmaceutical study This may be taken in an accredited junior college or in the first two years of a college of pharmacy offering a complete four-year course The second two years could then be devoted to an intensive and concentrated attention to the professional content of pharmacy, stressing not only the scientific side but also the economic or business side A program of this sort is in line with practices in other professions, and the sooner we enter their company and adopt their point of view the sooner we shall enter into our professional birthright and take our proper place with the professions of medicine and dentistry in helping solve the great problems of health and disease which are so very fundamental and important to our age in civilization

---

ABSTRACTS OF PAPERS PRESENTED BEFORE SCIENTIFIC SECTION, A PH A WASHINGTON MEETING, 1934

"Penetration of Volatile Oils and of Fixed Oils and Fats through the Intact Skin" by David Macht

A number of powerful pharmacological agents were incorporated into various fatty bases employed for making ointments, and their penetration through normal intact skin was studied by observing the effects produced by absorption if any of the drugs In another series of experiments various volatile oils, as well as some of their active chemical isomers were similarly used Constituents were applied directly to the skin, and absorption phenomena were studied and compared This research is of importance in connection with the use of various vehicles for the incorporation of active drugs to be applied to the skin

The Assay of Chloral," by Donald C Grove Edward M Hoshall and Glenn L Jenkins

The present official method for the assay of Chloral is shown to be inaccurate A method is proposed which is based on the conversion of the chlorine to chloride in a simple pressure bottle and a determination of the resulting chloride by argentimetric methods

Some Observations on the Stability of Quinine Sulphate during Storage," by L E Warren

Seven packages of freshly prepared quinine sulphate were stored under conditions simulating those obtaining in prescription dispensing The packages were opened at varying intervals and small portions removed from the surface of the material without disturbing the remainder The intervals from opening to the time when the product became stable (ceased to lose weight) were recorded In a climate comparable to Washington D C , the salt progressively loses water of crystallization until after 4 to 12 months it contains about two molecules (4 6%) after which it remains practically stable

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE A A C P, EDITOR OF THIS DEPARTMENT

PRESCRIPTION INCOMPATIBILITIES AND THEIR PROBLEMS FROM THE TEACHING STANDPOINT

BY RALPH E TERRY *

(*These articles continued from page 364 April Journal*)

From the teacher's standpoint, the presentation of the subject of Prescription Incompatibilities has many problems There are three outstanding factors which warrent discussion at this time These may be termed Time, Content, Method

Time—This factor might be subdivided into two distinct units, placement in the course of this subject and the amount of time allotted to the study of the subject Time in relationship to placement in the course needs very little mention for universally the study of Prescription Incompatibilities is reserved until the final term This is as it should be and no attempt should be made to introduce it at any earlier period even as a so-called "student interest" bait The fact that this is the most technical of all the courses offered in the Pharmacy curriculum demands the completion of the basic subjects There is also the possibility of confusing the student by applying some of the facts before he is well grounded in the fundamentals

Another important factor of *Time* is the question of how much time is to be allotted to the work Again differences in what should be taught as part of the course will cause considerable differences in time devoted This question of *Content* is to be discussed later, but a basic quantity of time should be assigned to the work A minimum number of clock hours might be specified, however, and it is hoped that during the discussion of this problem some opinions may be expressed on this question

Content—While the question of incompatibilities may be stated as a relative thing, there is no doubt but that certain reoccurring difficulties do arise To the novice almost any formula has possibilities of trouble, experience shows the way to avoid these hitches Therefore, in the teaching of the subject, we are facing two distinct phases, *first*, we must carefully arrange the exercises in such a way that they are of a progressive nature, and *second*, these should be of a practical nature where possible Progression can be secured only by careful selection One of the best devices to start out the work is to use an exercise which the student has previously completed in the regular work, and by restating the formula in slightly changed wording, profit by the student's experience Many times this "carry-over" will be disappointing to the teacher, but the student will recall the earlier exercise when the instructor explains it and there is an important feature here not to be overlooked, that of a repeated experience And all learning is simply repeating experiences until they become habits Therefore, the device of starting the subject on a familiar base should be used

* University of Illinois

The question of stating the problems as practical formulas will not always work since there are times when the facts can be better studied if the formula be stated in the theoretical manner Here again the possible carry-over from the previous subject should not be overlooked As an example, a formula calling for eye drops of silver nitrate in normal saline solution presents the old qualitative reaction dressed up in a pharmaceutical cloak And so there are a number of such reactions which might be used as starting points, carrying over into the new work facts learned early in the student s work and therefore more easily brought to mind

On the other hand, at times student interest can be aroused to a higher pitch if the problem is stated in practical language Then, too, the actual translation of laboratory experience into practical life is made easier if the applications are kept in mind at all times

One more important possibility in relation to *Content* of course, since this subject is taught at a time when the basic subjects have been covered, and since the study itself makes use of many of the facts previously learned, the teaching of prescription incompatibilities offers a wonderful opportunity for reviewing a large number of courses Here again is an opportunity to arrange the work in such a manner as to cover the basic subjects, yet the course should not degenerate into a mere review study

Method —Method is the most important of all the factors A good teacher with a well worked-out method can present a subject of inferior content and get better results than another instructor blest with a much better course content And *Method* should be made up of the following phases the materials, desk space, a text or manual and a goodly supply of teacher's time and energy This latter can not be over-stressed for if there is any place in the modern system of instruction where the old-fashioned preceptor method has a place it is in this particular study A few suggestions as to the best method, a careful supervision of the work, and then a short discussion following the completion of the exercise will do more to assist the student than any other system Here is where true teaching ability shows, some students need only a small amount of help Others need very careful and complete supervision, and when possible they should have it On the other hand they should not be too completely dominated since the loss of independence of action would be very undesirable Therefore, this feature must be carefully adapted to the individual student

Under a discussion of *Method,* a very important discussion is that of using the proper formulas In a previous paper, the use of small amounts of materials was outlined For the study of the theoretical phases of the subject, this is perhaps the best manner, but as a practical course, the use of "full-sized" formulas is urged Thus the student is confronted with the problem as he will see it in later work and by solving the laboratory problem he gains the confidence for his future work This is the important part of the course in Prescription Incompatibilities

SUGGESTIONS ON TEACHING A COURSE IN INCOMPATIBILITIES

JOHN S MITCHELL *

It seems there is always some controversy concerning the methods used and their procedure in teaching a course in incompatibilities in prescription writing

* Howard University

When one observes the varying results obtained from the compounding of a simple formula, he concludes that there is yet need for a more unified idea concerning that art which is the fundamental act of the practicing pharmacist

Now that the four-year course in pharmacy is going into effect, a better opportunity for broadening the course in incompatibilities is made possible Two major arguments, as to how a course of this kind should be taught, are given There are those who think a course of one lesson an hour a week, in the second year, is sufficient This one-hour period of course supplemented by a one-hour period of laboratory work Others reduce the time to one semester's work In either case there is the fault of the student memorizing the prescriptions to be discussed for that period, only to forget them and take new ones at the next meeting of the class Here the results are frequently disappointing, since sufficient time has not been given to the subject

There are those who feel that a more intensive course, consisting of one semester's work having two lecture periods and two laboratory periods a week, be given In the new four-year course outlined for the pharmacy student this idea seems a better one The student received a more intensified drilling and is able to recognize and adjust more readily the incompatibilities that are presented

The number of textbooks written on the subject are few However, it is not necessary to confine one's teaching to a specific book In either case the student is given prescriptions and is required to search for all incompatibilities, but compound as written Having observed the physical and chemical changes involved, he then, upon his own knowledge of these transformations, selects the procedure in compounding that will effect the best result This without interfering with the chemistry or therapy of the preparation The two prescriptions are then compared and notes made for the discussion in class Criticisms should be invited from the fellow students, enabling the instructor to have a better conception concerning the clearness of each problem in the student's mind

Frequent quizzes might be given Because in his course in Practical Dispensing the student is daily compounding, he constantly becomes more thoroughly acquainted with the many changes involved in the process of his operation This, of course, develops him in technique and stimulates in him clearer ideas concerning the art of prescription adjustment

HOW INCOMPATIBILITIES SHOULD BE TAUGHT AND HOW MUCH TIME SHOULD BE DEVOTED TO THEM?

BY D B R JOHNSON *

First, they should be taught in qualitative chemistry, showing the student at that time that every reagent used there becomes an incompatibility in dispensing If this is done by those teaching our chemistry to pharmacy students, then the chemical incompatibilities will be so well tied to the knowledge of chemistry that little more will be needed in a drug course on incompatibilities of this kind

The pharmaceutical incompatibilities should be stressed by the teacher at the time the student is carrying the galenicals and other pharmaceutical preparations In these the solvent used frequently determines the incompatibility of the various preparations

* University of Oklahoma

As to the therapeutic incompatibilities we have to deal with those drugs which when combined may create an overdose, or, when combined in the same preparation, one nullifies the action of the other This should be taken care of in the study of pharmacology, or if it be so taught, in the department of materia medica

Second, if this work has been well done as outlined, only a short course not to exceed two credit hours would be necessary to coordinate the field which I will designate as general incompatibilities

WHEN SHOULD DISPENSING BEGIN AND HOW MUCH TIME SHOULD BE DEVOTED TO IT?

First, we must consider the different state laws In some dispensing should occur or be partly taught, how to use a torsion balance, fold powder papers, fill capsules, etc , in the first semester so they will know a little of the technique when they take the Board of Pharmacy examination in the state On the other hand, a certain amount of the work, given in the first semester and continued at times in some pharmaceutical work through the entire school course, holds the mind of the student to the thing which he will be required to do after completing his course in pharmacy I think the work should parallel in a way the material that he is studying during the year in which this part of the dispensing is given

Second, as to the time that should be devoted for coordinating and completing the above-outlined course, I suggest about five credit hours or fifty-one lecture hours and approximately 102 laboratory hours for the final and coordinating part of the course

---

RESOLUTIONS AND RECOMMENDATIONS ADOPTED BY THE AMERICAN PHARMACEUTICAL ASSOCIATION AT ITS EIGHTY SECOND ANNUAL MEETING IN WASHINGTON D C , MAY 7–12, 1934, UPON RECOMMENDATION OF THE HOUSE OF DELEGATES THROUGH ITS COMMITTEE ON RESOLUTIONS

ADDRESS OF PRESIDENT ROBERT L SWAIN

We desire to record our deep appreciation of the masterly address delivered by our president, from which we desire to submit the following resolutions for your action

No 1 Maintenance Committee, American Institute of Pharmacy

Resolved that the committees on Campaign Funds Site and Plans for the A PH A Headquarters Building be discontinued, and that a new committee be set up to consolidate the work done so far and to push on to the ultimate objective, title of this committee to be the 'American Institute of Pharmacy Maintenance Committee" and that H A B Dunning chairman of the present Campaign Fund Committee be asked to assume the chairmanship of the Maintenance Committee

No 2 Retiring President on the Council

Resolved, that the Constitution and By Laws be amended to provide that the retiring president become an *ex officio* member of the Council for the succeeding year

No 3 Chairman House of Delegates and the Presidency

Resolved, that the chairman of the House of Delegates be ineligible for nomination for the presidency during the term of his office and that this action shall not apply in any sense to the present chairman or vice chairman

No 4 Selection of Candidates for Presidency

Resolved that the By-Laws be so amended as to provide for the nomination of two candi

dates only for the office of president The committee desires to submit this recommendation to the Council for their study and proper action

No 5 Study of State Codes

Resolved that a special committee be appointed to make a thorough study of all state codes and the legislative acts under which they have been created, as many of their provisions are certain to affect the conditions under which pharmaceutical service is made available

No 6 Food and Drugs Act

Resolved, that the Food and Drugs Act be amended to include cosmetics and to bring advertising under Federal supervision and control and that no necessary power should be denied the enforcing agency, and that the public interest should be the paramount consideration On the other hand, however broad sweeping and uncontrolled powers should be withheld as unnecessary to the purposes of the Act and as inconsistent with our theories of Government Industry should not be unduly harassed but should be given every freedom consistent with the basic purposes of the Act

No 7 Distribution of Drugs and Medicines

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION re-affirm its time-honored position that drugs and medicines should be distributed by registered pharmacists only, and that a carefully selected committee be appointed to draft a model act to bring this condition about in every state

No 8 Study of Pharmaceutical Legislation

Resolved that the ASSOCIATION give serious study to the matter of pharmaceutical legislation and that some agency be set up to study pharmaceutical legislation so that it may be modernized and made consistent with the advances made educationally and professionally

No 9 Membership Plan

The committee desires to approve the comprehensive plan outlined in the address of the president relative to the matter of membership and further desires to recommend this for the proper consideration of the Council

No 10 Award to Pharmaceutical Publication

Resolved, that the ASSOCIATION award a medal yearly to that publication meeting a certain standard of excellence and that this medal be awarded by a committee to be entitled the A PH A Commission on Membership and Awards which committee is to be composed of the former presidents of the ASSOCIATION In approving this resolution, the committee desires to express its sincere hope that the past presidents will embrace this opportunity to advance the cause of pharmaceutical journalism

ADDRESS OF CHAIRMAN P H COSTELLO OF THE HOUSE OF DELEGATES

We desire to express our appreciation of the address of Chairman Costello, and urge that the membership acquaint themselves with its contents

No 11 Pharmacy Week

Resolved that the A PH A continue its support of the observance of 'National Pharmacy Week," and records its deep appreciation of the splendid aid given this movement by the various state associations

No 12 Publication of Proceedings of Annual Meeting

Resolved, that we record our appreciation of the promptness with which the material of the annual convention has been made available to the membership through successive issues of the JOURNAL and that consideration be given to publishing the entire proceedings of the A PH A in one issue of the JOURNAL as soon as feasible

No 13 Institute of Pharmacy Commemorative Stamp

Resolved, that we approve the adoption of a U S commemorative stamp on the dedication of the American Institute of Pharmacy and suggest that an attempt be made through a proper committee to have favorable action taken on this plan

No 14 Material for Library and Museum Institute of Pharmacy

Resolved, that the attention of pharmacists of the country be drawn to the establishment in the American Institute of Pharmacy of a reference library and historical museum These divisions are intended to collect and exhibit various materials which will illustrate the development of pharmacy and pharmaceutical literature Pharmacists of all sections are invited to contribute to the library and museum any materials suitable for these purposes

No 15 Procter Memorial

Resolved, that the Committee on the William Procter, Jr Memorial Fund be instructed to proceed with the erection of the Procter Statue in the foyer of the American Institute of Pharmacy as outlined and that in conjunction with the Council, arrangements be made for its unveiling when completed

No 16 H R 3768

Resolved that the ASSOCIATION approve H R 3768 changing the title Retail Liquor Dealers Stamp Tax to the 'Medicinal Spirits Stamp Tax," and that a copy be sent to the chairman of the Senate Finance Committee and to Senator King, chairman of the Sub Committee

No 17 Committee on Pharmacy Corps in the U S Army

Resolved, that the Committee be continued and instructed to secure the establishment of pharmacy properly in the United States Army, that is, that the opportunity for service recognition and advancement of the pharmacist in the Army shall be on a parity with that of the commissioned personnel in the Dental and the Medical Corps of the Medical Department

That the ASSOCIATION renew its request that the leading pharmaceutical organizations of America including state pharmaceutical associations, continue special committees on the establishment of and recognition of pharmacy in keeping with its professional dignity and merit in the United States Army, all working together for this worthy cause

That the chairman of this Committee, for the following year at least, be some competent member of this ASSOCIATION who resides sufficiently near the National Capital so that he may readily confer with the officials through whom our work can best be forwarded

No 18 Committee on Press Relations

Resolved that a vote of thanks be extended to the chairman of the Press Relations Committee and his co workers for the efficient work in giving to the press the publicity of the annual meeting held in Washington during this week

No 19 Resolution of Thanks to Governmental Agencies

Resolved, that the ASSOCIATION hereby express its appreciation for the interest and helpful support given by the Commission of Fine Arts, the National Capitol Park and Planning Commission, the Commissioners of the District of Columbia, by other Governmental agencies, and by members of Congress in connection with the location and completion of the American Institute of Pharmacy

No 20 Resolution of Thanks to Architects, Builders, Etc

Resolved that the ASSOCIATION hereby express its appreciation to John Russell Pope Architect, to A F Brinckerhoff, Landscape Architect, to the George A Fuller Company, Builders and to all who have cooperated with them in designing, planning, erecting and furnishing the American Institute of Pharmacy and in landscaping and planting the grounds

No 21 Resolution of Thanks to Hosts

Resolved, that the A PH A extend its sincere thanks to the District of Columbia Pharmaceutical Association to Local Secretary Frank Delgado Chairman Paul Pearson, Mrs Moskey, chairman of the Women's Committee, W P Herbst chairman of the Entertainment Committee and other committee chairmen, the Greater National Capital Committee of the Washington Board of Trade, and the pharmacists of Washington for their hospitality

AN ENGROSSED PARCHMENT FROM THE BRITISH PHARMACEUTICAL SOCIETY

The British Pharmaceutical Society presented an engrossed parchment conveying congratulations on the occasion of the dedication of the American Institute of Pharmacy The document evidences a spirit of friendship and professional relation which is reciprocated and greatly appreciated by the AMERICAN PHARMACEUTICAL ASSOCIATION President F Gladstone Hines, Secretary Hugh N Linstead, Council Member Thomas Marns and Chairman of the British Pharmaceutical Conference Herbert Skinner, attended the Toronto meeting of the A PH A The latter sent a congratulatory cablegram to the Washington convention Copy of the Parchment follows

DEDICATION OF THE AMERICAN INSTITUTE OF PHARMACY

To the AMERICAN PHARMACEUTICAL ASSOCIATION

THE Pharmaceutical Society of Great Britain sends cordial greetings upon the occasion of the dedication of the American Institute of Pharmacy

The Society has known and sympathized with your desire for a headquarters building where your work could proceed without the limitations that have hampered it in the past and it has watched with interest the progress that has been made in recent years toward the fulfilment of this desire in the form of the American Institute of Pharmacy It has been with great pleasure that the Society has learned of the completion of the Institute and of the arrangements for its dedication

THE Society congratulates you heartily upon now possessing a headquarters worthy of your ideals and of the importance of your work and it shares the pride and satisfaction you must feel in a building that combines suitability for its purpose with classic grace and dignity It is a matter of no less gratification to the Society that the Institute should be situated in surroundings of charm and distinction and should enjoy the amenities and prestige derived therefrom The existence of a central institution focusing the pharmaceutical life of the country, acting as a unifying and coordinating influence and providing facilities for the advancement of pharmaceutical knowledge, education and cooperation should prove of great value to pharmacy in the United States of America, the Society sincerely trusts that your services in establishing such an institution will receive due recognition and that you will enjoy a future of increasing progress and prosperity

John Keall, *President,*
E Saville Peck, *Vice-President,*
Hugh N Linstead, *Secretary*

April 24, 1934

PRESIDENT ROOSEVELT'S DEDICATION MESSAGE

THE WHITE HOUSE
WASHINGTON

April 26, 1934

It is with real pleasure that I extend my congratulations and my best wishes to the American Pharmaceutical Association, and to the profession of pharmacy, on this occasion the dedication of this beautiful structure appropriately located here in the Nation's capital as the headquarters of your Association is an important milestone in its history.

I regret that the press of Executive duties has made it impossible for me to greet you here personally, but through this message I express my appreciation of the great work which you have accomplished in the past in contributing to improved standards, not only in products but in professional education and in professional integrity, and in putting American pharmacy in the forefront of the world.

I am proud of the reputation which American drug and biological products, used in the prevention and treatment of disease, enjoy throughout the world and am fully conscious of their importance in our commerce, both national and international. You have cooperated with the medical profession in joint endeavor to prevent and cure illness, lessen suffering, and restore to usefulness and happiness the afflicted of all lands, and you must feel a justifiable pride in making such a contribution to human welfare.

Franklin D. Roosevelt

DEDICATION OF THE AMERICAN INSTITUTE OF PHARMACY

THE DEDICATION

A beautiful day welcomed an assemblage of one thousand or more of invited guests and members of the AMERICAN PHARMACEUTICAL ASSOCIATION at the dedication exercises, held at its home—the American Institute of Pharmacy—on Wednesday, May 9th It was regretted that the President could not attend, but he sent a congratulatory message, which is made the preface of this report

INTRODUCTORY ADDRESS

BY SAMUEL L HILTON, CHAIRMAN

Fellow Members, Honored Guests, Ladies and Gentlemen

As Chairman of the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION, I deem it a privilege as well as a pleasure to welcome you to the dedication exercises this morning

It has been a long cherished ambition for us to erect or found or establish a permanent headquarters where all of the activities of the ASSOCIATION could be concentrated and conducted, and where its valuable collection of historical material illustrating the development of pharmacy in this country could be exhibited

The ASSOCIATION has also looked forward to the establishment of a reference library of pharmacy and of a research institute for the improvement of standards for materials used in the prevention and treatment of disease

We are here assembled this morning to dedicate this beautiful and impressive building, designed by Mr John Russell Pope, the well-known architect, approved by the Fine Arts Commission and which will stand as a monument to American Pharmacy and as a consummation of the hopes of all of those interested in our profession

We had hoped to have with us this morning the President of the United States, the activities of Congress now in session, the conditions now existing and the demands on the President's time necessitated his declining, he has, however, sent us a message, this message will be presented by Dr George W McCoy, Director of the National Institute of Health

I am gratified and much pleased to present Dr George W McCoy

In introducing Dr George W McCoy, director of the National Institute of Health Chairman Samuel L Hilton stated that the activities of Congress and the demands on the President's time necessitated his declining the invitation to be present on this occasion, however he sent a message to be presented by Dr McCoy Chairman Hilton remarked that many in the audience knew Dr McCoy, and it was his pleasure and privilege to present him

Dr McCoy's prefatory remarks were addressed "Mr Chairman, Distinguished Guests, Members of the AMERICAN PHARMACEUTICAL ASSOCIATION—I present the following message from the President of the United States "

He then read the message which appears on the preceding page Chairman Hilton thanked Dr McCoy and the audience stood

The chairman introduced as the next speaker Robert L Swain, president of the AMERICAN PHARMACEUTICAL ASSOCIATION

THE AMERICAN INSTITUTE OF PHARMACY DEDICATION ADDRESS

BY ROBERT L SWAIN

"All below is strength, and all above is grace"—Dryden

A contemporary wrote that "Mr Jefferson is the first American who has consulted the fine arts to know how he should shelter himself from the weather" It is most gratifying to note that the AMERICAN PHARMACEUTICAL ASSOCIATION, more than a century and a half later, resorted to the same source in planning and building this home And the arts have given lavishly that the home might be a perfect thing Elegance, charm, grace, all of these have conspired to create some thing of surpassing loveliness To gaze upon this building is to look into the very countenance of art itself A strange feeling of exaltation and humility comes over us as we speak of it as home

And so we assemble here this morning to dedicate this, the American Institute of Pharmacy, as the home of the AMERICAN PHARMACEUTICAL ASSOCIATION It is indeed a most happy occasion The whole thing seems so supremely as it should be For more than eighty-two years, the ASSOCIATION has been in existence, but for all of this period she has been living with members of the family During all of these years, she has been looked after by loyal sons, who have taken enough of their busy lives to see to it that she was sheltered properly, and cared for as her interests and activities demanded First, she made her home with a famous son in Philadelphia in 1852 In 1853, she moved to Cincinnati, and back to Philadelphia in 1858, and on to New York in 1859 In 1862, she returned to Philadelphia, but went back to New York in 1863 Returning to Philadelphia two years later, she remained there until 1894 In that year, she came to Baltimore for an extended visit of fifteen years For three years, she graced the city of Scio, Ohio, and from there journeyed to Chicago, where she remained until 1925 From 1925 to 1934, she again favored Baltimore On the first day of this year, she moved over to Washing ton, and proudly, and it must be admitted a bit belatedly, came in as mistress of her own home As loyal members of the family, we claim our kinship with a feeling of pride We seem to sense that there is something fine in belonging to her house hold As we shower her with congratulations, we confess to a feeling of superiority ourselves as we note that she has acquired a home in surroundings heretofore re served for the immortals

What a matchless scene! The setting of this building alone is sufficient to stir us to the depths of our very souls It is majestic in the fullness of its meaning The ages seem to converge to this very point The hopes, the struggles, the deep yearnings of countless centuries seem to press close to us as we assemble here Here we stand very near to the nation's heart Here we seem to be a part of her proud traditions Here her great teachings seem to take on new life, and to shine with the splendor of the sun

The Capitol of the United States, sitting in quiet majesty at the other end of the Avenue, serves to emphasize the full significance of this undertaking The

banner, which so proudly floats above it, has always been an emblem of promise to the peoples of the world From the earliest days, this country has been devoted to principles of justice and right Her institutions have been expressive of the hopes of a free people, and dedicated to a betterment of all human relations Wars of aggression or oppression do not blot her history Rather she has shed her blood lavishly that the world might enjoy liberty and security May she become the example of all lands "Let us have peace"

We are almost within the shadow of the Washington Monument, this monument of clear, sharp outlines, symbolic of the righteousness of his character, and the symmetry of his life His life rose to such supreme heights that it has been said "the test of progress of mankind will be in the appreciation of the character of Washington" As we gaze upon his classic obelisk, we almost catch the words of Lincoln as he pours out his heart to the only American greater than himself "To add brightness to the sun, or glory to the name of Washington is alike impossible Let none attempt it In solemn awe pronounce the name, and in its naked, deathless splendor, leave it shining on"

In front of us looms the Lincoln Memorial I never stand before this edifice, but I recall the devout lines from Milton "Beauty is God's handwriting—a wayside sacrament" This memorial is a sacrament It stands a tribute to one whose great heart beat for humanity, and whose blood was poured out upon the altar of national unity To him, perhaps as to no other, the world turns in its hours of distress and pain It brings its tears to his very feet It looks into his great eyes for compassion and understanding It was he whose life embraced all life, and whose death teaches how impossible it is for eternal truth to die It is beyond the power of the human mind to think of Lincoln as dead His life, his principles, his great soul are as enduring as the stars He belongs to the ages and to us As we tune our minds to his this morning, we sense the full, deep rhythm of his heart as he pours out his soul to an anguished people "It is rather for us to be here dedicated to the great task remaining before us, that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion, that we here highly resolve that these dead shall not have died in vain, and this nation, under God, shall have a new birth of freedom, and that government of the people, by the people, and for the people shall not perish from the earth"

But a short distance away, over the Arlington Memorial Bridge, lie the nation's dead There, enshrined forever, are those whose lives were devoted to the principle that this country should be a covenant with ages yet unborn, those whose death inspires us to keep the faith, to keep unspotted and unstained the banner for which they died, and under which we live and move As we begin to understand all that our history means, all that it teaches and confounds, all that it builds up and destroys, we become more able to chart the real from the unreal, and to march in tune with the nation's faith and destiny

This building, so aptly named the American Institute of Pharmacy, seems to have been conceived for erection on this very spot Its design is the portrayal of an artist's soul It had its inspiration in a lofty sentiment It is a beautiful dream translated into matchless marble Some great mind has said that architecture is frozen music Certainly it can be nothing less No one can gaze upon

these classic walls without thinking great thoughts, dreaming great dreams, and daring to do great deeds

I have seen this building rise stone by stone I was here when the first spade was pushed into the ground I have watched the patient labor with which this building became an actual thing The process has been a bit mystifying to me I can see how the architect, in the rarified atmosphere of his own mind, might dream this dream I can see it take form and grace in the deep recesses of his own soul It is here that the artist lives, it is from such endless things he draws his inspiration I confess frankly, however, that the process by which the dream emerges in deathless stone remains a mystery It is nothing short of making reality out of unreality, and of translating infinity into the finite It is because of the subtlety of the process that I have a profound respect for the man who deals with the material side He, too, must see poetry in brick and stone He, too, must possess the mystic touch that transmutes the baser metals into gold

To me this building becomes a symbol, a symbol of a profession devoted to the eradication of disease, and to a betterment of the conditions under which we live It symbolizes the countless ages through which pharmacy has trudged side by side with man as he pulled himself along the highways of the past It symbolizes the tenets of professional doctrines which have demanded higher and ever higher stand ards for drugs and medicines It symbolizes the quiet faith of the research worker as he crystallizes his imagination and creative skill into new products for the alleviation of pain It symbolizes the determination and patience of the pharmaceutical educator as he pours out his life in training others for their great responsibilities It symbolizes the obligation of pharmacy as it bends to the task of conserving and improving the public health It is a symbol that pharmacy will be as true to the future as it has been to the past

Aside from the beauty of its surrounding and the quiet grace of its design, the American Institute of Pharmacy will be devoted to the development of phar macy, and for a betterment of its professional service It will become a veritable workshop for the advancement of those sciences upon which the public health so largely depends It will house promptly, so I fervently hope, all those agencies concerned with professional phases of pharmaceutical work I hope that pharma ceutical education will make its headquarters here, and that the legal side of pharmacy, as represented by the examining boards, will also seek a place here

I look forward to the time when these walls will embrace a well-rounded, efficient and forward-looking pharmaceutical program There are many studies of the most far-reaching importance which need to be organized, systematized and carried out without undue delay There are research studies of great bearing upon the United States Pharmacopœia and the National Formulary, as national legal standards for drugs and medicines, which should be begun The drug industry and the Government should look here for the scientific work upon which drug standards rest, and for the technical directions under which they are to be achieved Un folding of the picture indicates just what a magnificent destiny confronts us

Unfolding of this picture also discloses our individual responsibility It challenges us to give our best thoughts and talents to our profession It is a crying demand to measure up to our responsibilities to ourselves and to be diligent in meeting our obligations to the public health In a large measure, this mag

nificent undertaking will fail if it does not kindle an inextinguishable fire in our professional consciousness Not only must this building rightfully portray our calling, it is necessary that we, too, measure up to the same standard and assume, in no small part, the same task

As we dedicate this building, we should, in an equally large measure, dedicate ourselves There is a vast work to be done within our own ranks There are those who have wandered off into strange lands, and are bowing down to strange gods There are those who would tear down rather than build up There are those who scoff at professional ideals, and who deny the existence of high professional principles There are those who would destroy the intrinsic things for which pharmacy stands

We need a greater devotion to fundamental things We need to see beyond the purely materialistic point of view We need to grasp the bigness of the task which gives us a real place in the fight against disease We really need to think great thoughts We need to feel just what one great soul must have felt when he said that "every calling is great that is greatly pursued "

As we become aware of the vastness of this project, as our hearts begin to beat in harmony with its great ideals, as we catch a glimpse of the immensity of the principles for which it stands, let us, too, become dedicated to the great tasks remaining before us Let us resolve that this edifice shall really be our image! Let us be determined to be worthy of it May we never forget that the American Institute of Pharmacy is dedicated to those who have contributed their knowledge and endeavor to the preservation of public health and to the further advancement of science in pharmacy

Chairman Hilton thanked President Swain

In introducing the next speaker Chairman Hilton referred to the outstanding work in Government development and the beautifying of Constitution Avenue and other sections of Washington for which Mr Charles Moore is the directing head and which is making the City the most beautiful in the world He also referred to him as a friend of this organization and as chairman of the Fine Arts Commission

RELATION OF THE INSTITUTE TO THE WASHINGTON PLAN

BY CHARLES MOORE *

The original plan of Washington designed by L'Enfant in cooperation with President Washington was reaffirmed and extended by the Senate Park Commission of 1901 That plan maps main elements of the scheme of development you now see in progress The Lincoln Memorial, one of the chief features of the large plan, has now taken its place among the chief monuments of the world The building, like the man, belongs to the ages On its inner walls are carved Lincoln's Gettysburg Address and his Second Inaugural, heart-born thoughts expressed in diction comparable with Pericles's immortal oration over the Greeks who fell at Thermopylæ

Into the sphere of architectural influence exercised by the Lincoln Memorial this Pharmaceutical building comes By virtue of patient and sympathetic co-

* Chairman National Commission of Fine Arts

operation between your officers and architect and the members of the National Commission of Fine Arts, this building has become a vital portion of the frame to the Lincoln Memorial picture

How vital is this relationship was very recently told me by your reticent architect, John Russell Pope "When plans were making to mark Abraham Lincoln's birthplace at Hodgenville, Kentucky, the program of competition called for one building to embody in its architecture as well as its contents the spirit of Lincoln I submitted a design based on this representative idea When a totally different scheme was adopted, I put away my drawing sadly, as every artist does when he finds one of his conceptions fails of realization Years passed This Pharmaceutical Building came to me I made many sketches One day the design for the Lincoln Birthplace came to mind I got it out of its repose and found that to my mind essentially it solved the double problem of a building with a purpose and yet in spirit akin to the Monument in whose company it stands "

Such in brief is the story of the inception and conception of this Pharmacy Building Unconsciously the spirit of the design—its elegant simplicity, the richness of its landscape setting, its thorough appropriateness instantly impress artist and layman alike So, my friends of long struggles now happily ended, let me congratulate you on providing a fitting home for the life-saving service your profession performs, and at the same time paying due tribute to the Savior of our Country May you persevere in well doing both in spirit and in architecture

Chairman Hilton referred to the building of the American Institute of Pharmacy as the design of an artist who grasped the ideals of the officers of the AMERICAN PHARMACEUTICAL ASSOCIATION Mr Pope was called to Europe, the chairman introduced Mr Daniel Higgins, a partner of the former

REMARKS BY DANIEL HIGGINS (in part)

Mr Pope would be delighted to be here and meet the members of the ASSOCIATION, the other partner, Mr Eggers,[1] is here and delighted to meet those who have inspired this architecture He believed that Drs H A B Dunning and E F Kelly were more responsible for this achievement than the architects The symbolizing of the ideal in one building is extraordinary and this inspiration led the architects to do the very best that was in them When Mr Pope first heard of this great ideal he gave it much attention "to bring out something " It gave us a great opportunity and the hope is that we will again have a pleasant association He turned over the key to Chairman Dunning with a great deal of appreciation for all of his efforts, for without his work and that of Secretary Kelly, this building would not have been a success

Chairman Hilton thanked Mr Higgins and introduced Theodore Weicker, who came forward at once with a contribution when the project was started

REMARKS BY THEODORE WEICKER

Ladies and Gentlemen

Not far from the spot upon which we are standing rises one of the most beautiful edifices that we as a people have ever built In the beauty and the simplicity of its

[1] It was necessary for Mr Eggers to return to New York

architecture, it compares with those temples which the Athenians of old set upon the height of the Acropolis With all the massive beauty of its gleaming marble, that building is yet a symbol—symbol of a man who lived to preserve the highest ideals of this nation In that temple, as in the hearts of his countrymen, is enshrined forever the name of Abraham Lincoln

We are gathered here to-day to dedicate another building—a building which is also a symbol In its classic simplicity, this building represents the high ideals that should forever inspire and guide American Pharmacy

From the earliest beginnings to the present day, the profession of pharmacy, guided by such ideals and dedicated to the service of the people's health, has grown steadily in importance Steadily throughout the world it has developed into a body of true organized science, as an aid to medicine

But American Pharmacy, especially in the last two decades, has been beset by a growing commercial spirit, a spirit generated in part by economic pressure and in part through the failure of our governmental agencies to comprehend the character and the very nature of pharmacy The hand of greed has striven to destroy the ideals of this profession It has put in the path of those who would practice it in this country new and greater difficulties and uncertainties Its pressure has made it almost an impossibility at times for a pharmacist to function without making compromises or sacrifices which endanger his very existence

The hand of greed must not be permitted to destroy the ideals for which this profession has always stood —Man lives for something more than bread alone

The noble building which we have come here to dedicate is in itself a challenge to the commercial spirit which has intruded itself into the field of American Pharmacy, and which menaces the purposes of this high calling The prominence of the site this building occupies in the Capital of our country, the pure grace and nobility of its design, the well-considered appointments of its interior are the more important to us all because of the challenge they symbolize

In dedicating this building, then, shall we not also consecrate ourselves anew to the proposition that American Pharmacy shall not be mastered by commercial ambition—that American Pharmacy shall take its rightful place in our civilization as an indispensable aid to the medical profession and as an indispensable force in making a better and healthier America?

To these ends and in this spirit of consecration we dedicate The American Institute of Pharmacy

Dr R B J Stanbury, secretary of the Canadian Pharmaceutical Association, was introduced

REMARKS BY R B J STANBURY

I bring to you the cordial greetings of the pharmacists of Canada on this epoch-making occasion—the dedication of this beautiful temple to American Pharmacy

This building will be the center from which pharmaceutical influence will radiate, and here will be the place to which pharmaceutical forces will converge This structure is not entirely the product of those immediately associated with its construction, although their efforts merit the highest praise It is the cope-stone of the achievement of those who in past years have dug deep the foundations and who

tirelessly and persistently laid stone upon stone and tier upon tier till to day this splendid superstructure stands, the admiration of all

On looking over our drug stores to-day I consider that many of our troubles are of our own making If good old Galen, the Father of Pharmacy, could look over the parapets of heaven or gaze upon us from his "open view" celestial dispensary, I am sure he would be vexed and humiliated to see the lunch counter, the cigar stand, the magazine rack and various kitchen utensils occupying the principal place in the drug store, while those tinctures and pharmaceutical preparations, which he toiled so laboriously to produce, are hidden away in some obscure corner

I think, Sir, we need to clear away the excrement which has accumulated in the drug store, during the past generation more particularly, which is making it ob noxious in the nostrils of physicians and a by-word in the press, and by the public We might not need sixty thousand so called drug stores in this country, but the thirty thousand survivors doing the real work of pharmacy, becoming a real hand maid and complement of the physician, would command the respect and honor of both physician and public

I trust, Sir, under the ægis and inspiration of this Building which is being dedicated to-day, and of the men who are giving leadership, there may be a renaissance of pharmacy in this country, and a greater emphasis placed on the professional side of our vocation

The chairman thanked Secretary Stanbury and introduced William Pfeil a boyhood friend who was born on the site now occupied by the American Institute of Pharmacy and still resides within a block of the building He referred to the great interest of Dr Hilton who had enlisted him in securing part of this property He gave a brief account of the development of this section

Chairman Hilton spoke of the dynamic power and executive ability of Chairman H A B Dunning which was largely responsible for the American Institute of Pharmacy His heart and soul are in the work Chairman Hilton then introduced Dr Dunning who introduced his remarks by saying that his part was the practical side of the work and he wished to impress that he was seeking practical reactions through his address

REMARKS BY H A B DUNNING

The AMERICAN PHARMACEUTICAL ASSOCIATION was established 82 years ago, with the object of advancing the science and art of pharmacy and of improving the conditions of pharmaceutical practice

Throughout all the years that have passed since its organization, the ASSOCIATION has fought for and maintained the ethics, ideals and professional principles which represent the true value of pharmacy

Its membership has embraced the best of everything in pharmacy—educationally, scientifically and altruistically—including pharmacists engaged in all branches of the profession and industry, and scientists and research workers interested in the advancement of pharmacy It has emphasized the obligation of the profession to the public which it serves and has striven to throw every possible public protection around the preparation, standardization, distribution and dispensing of drugs, medicines and medical supplies

The ASSOCIATION, from the beginning, has taken leadership in all those activities which represent the improvement and progress of pharmacy as a public health service These activities have included pharmaceutical education and training,

the examination and licensing of pharmacists by the states, legislation regulating the practice of pharmacy and limiting it to those so licensed, legislation controlling the identity, purity and strength of drugs, the development of the literature of pharmacy and the stimulation of research for the discovery of new medicinal agents and the improvement of those in use It has worked to organize pharmacists for their own advancement and for the better service and protection of the people

Its members have been especially active in promoting and improving drug standards and in the enactment of laws governing the proper distribution of drug products They have taken an increasingly important part in the decennial revisions of the United States Pharmacopœia The ASSOCIATION established, revises and owns the National Formulary These two works recognize and provide standards for the drugs and preparations generally employed by all branches of the medical profession in the treatment and prevention of disease They were voluntarily observed until their adoption by the Pure Food and Drugs Act, which gave them a legal status

The ASSOCIATION has furnished models for most of the laws, state and national, which affect pharmacy, and is interested in their constant improvement to meet the advancing requirements of the time

It is not my purpose to review or even to summarize the great work carried on by the ASSOCIATION in the past eighty years It is rather my idea to establish a background for the institution which we are here to dedicate This architecturally perfect, wonderfully located, impressive building is not intended as an expression of pride by the pharmacists of this or other countries—it is to be a service institution to all pharmacy and to all people It represents an effort to concentrate and equip these agencies interested in the advancement of our profession and the improvement of pharmaceutical service

The impressive location and handsome exterior of the building will attract the attention of many people who know but little of the value and service of pharmacy and the institution, which will be open to the public, will provide the opportunity to obtain first-hand information

On either side of the beautiful rotunda, space is provided for a reference library and an historical museum, both of which are intended to illustrate the development of the art and science of pharmacy

As the building has been occupied only since January, the library and museum are but partly arranged There is a vast amount of valuable material available and these divisions of the institution will grow in importance as time goes on

In the rear of the building is a series of offices in which it is intended to accommodate the general activities of the ASSOCIATION and of those related bodies which meet the requirements of Public Resolution No 18, adopted by Congress, limiting the use of the building to those organizations and institutions serving American Pharmacy on a non-profit basis Here, in time, will be housed all of those interests which work disinterestedly and cooperatively for the preservation and advancement of professional pharmacy and for the betterment of its public health service

The facilities offered by this building will be immediately available to the following educational and professional pharmaceutical bodies, and it is hoped that they will make use of them—American Association of Colleges of Pharmacy, Ameri-

can Association of Boards of Pharmacy, Conference of Law Enforcement Officials, National Formulary Revision Committee, United States Pharmacopœial Revision Committee—and a large room is provided for quarterly or semi-annual meetings of the Conference of Pharmaceutical Association Secretaries Here, all together, will be housed all of those interests, working disinterestedly for the advancement, progress and preservation of professional pharmacy, with the object, through co-operation and earnest endeavor, of correlating the work and efforts which must result in the improvement of pharmaceutical practice and the betterment of the public health service

Immediately in the rear of this building, within a short time, there will begin the erection of another building, of much the same size, or perhaps a little larger, of a fitting architectural design, by the same architect, a research laboratory, fully equipped, representing a gift from a graduate pharmacist, now a manufacturer of pharmaceutical products used throughout the world

In the beginning, the work in this research laboratory will be devoted, almost entirely, to the standardization of the drugs and chemicals and preparations recognized in the United States Pharmacopœia and the National Formulary It is not intended that the work in this research laboratory should, in any sense, conflict with or take the place of, the tremendous amount of voluntary investigative work which is being done by hundreds of pharmacists and other scientists throughout the United States, either representing the efforts of the individual pharmacists, or the special investigations being made in the research departments of large manufacturing drug houses Most of this work will be self-supporting and will be paid for out of the funds accumulated out of the sale of the National Formulary, or with funds allocated by the United States Pharmacopœial Committee, in payment for special investigative work

It is hoped and expected that, as time goes on and new funds are available, other special investigations, in cooperation with our numerous pharmaceutical research laboratories, will develop

I have not said anything in this address about how the building came to be thought of and happens to be here It is much too long a story to tell, under the present circumstances, but I can give you some of the high lights

The idea was advanced from time to time during the past twenty-five or thirty years, by different leaders of the ASSOCIATION and, in time, a committee was formed with the purpose of accumulating funds, but no very great progress was made until 1923 At that time a new committee took over the work and, within a year or two, raised approximately half a million dollars, through the contributions of the retail, wholesale and manufacturing pharmacists in this country and from other countries Over 16,000 donations were made, a few exceeded $50,000 and a number were in excess of $10,000 It is not now appropriate to tell you of the trials and tribulations suffered by your committee in obtaining the site on which this building stands and keeping it after we got it, but I must tell you that, without the cooperation of the Fine Arts Commission and the Parks and Planning Commission of this City, it is doubtful that we would have been able to accomplish our purposes

In conclusion, I wish to impress upon all of those who have contributed time, labor, interest and money to this project that this building is not a white elephant on the hands of the AMERICAN PHARMACEUTICAL ASSOCIATION The building is

practically paid for, including land, equipment, furnishings, and its cost is nothing comparable to its value

The operations of the building, as they stand now, are almost self-sustaining, but not quite I am confident that those of you who are interested in pharmacy, who are here to day or will come in the future, will be quite willing to do their part, not only in clearing away the very small financial liability, but will provide an additional sum for the maintenance of the work which is planned to be done here and for conservative and necessary expansion

I am sure that all of you realize the importance of this project to pharmacy, not only from a professional and altruistic viewpoint, but from a material standpoint The prestige of pharmacy must be maintained, if it is to continue to enjoy the special privileges and advantages which the public accords it as a profession I believe that all of us realize that the AMERICAN PHARMACEUTICAL ASSOCIATION represents the greatest assurance for the security of these privileges and that this fine new building gives it a better opportunity than ever before to fulfil its mission

After concluding his address Chairman Dunning referred to a visit to Mr Pope's home to discuss plans for the building, he said

"He told me much the same thing that Mr Higgins has told you, that he felt that this building, the design for this building, represented the most artistic, and the most important effort of his life from an architectural viewpoint, and that it was close to his heart, and that he would be most happy to see his ideas materialize

"Mr Higgins took the opportunity to turn over to me this small key (holding up the key) to this comparatively large building The relationship of this key in size to the building is just about the proper proportion in my mind, and in the minds of others, to its value to pharmacy and to our people

"I am passing this key to the man who will make the most use of it, the most practical use of it, and whose heart and soul are tied up in the work that will be carried on in this building, whose heart and soul are tied up and have been tied up in Pharmacy and its progress and advancement for many years, and if he doesn't work himself to death, probably he will spend many more valuable years, valuable to us and to him, in serving pharmacy in the cause of public health "

Chairman Hilton said that no exercises of the AMERICAN PHARMACEUTICAL ASSOCIATION would be complete without a message from Secretary Kelly He introduced him as one who could always be depended upon and has never been found wanting

REMARKS OF SECRETARY KELLY

Ladies and Gentlemen, it is a great pleasure for me to accept, on behalf of the ASSOCIATION, this key to our home However, I want you to know that it is only a symbol and that from this time on these doors will never be closed to those who are interested in our work

It has been a very great pleasure to me to work with Dr Dunning, Dr Beal and others who have contributed so materially to our efforts to erect this building and I join in Dr Dunning's expression of appreciation to those agencies of our Government who have been so helpful to us in carrying our plans to completion

We also assure you, as he has, that this is intended to be a service institution We hope you will never hesitate in letting us know how to make it more useful to

the health and well-being of the people of this country We desire to make the most helpful contribution possible to the standardization and improvement by scientific processes of those materials that are used in the prevention and the treatment of disease

It is my very pleasant duty to thank those of you who have come here to help us celebrate this great event in the history of our organization We hope to see you here frequently and, particularly, wish to express our appreciation to those who are here representing other than our profession Our desire is to have the American Institute of Pharmacy represent a closer unity between the organizations that have to do with public health I thank you very much

Chairman Hilton stated that when the building was under way for the laying of the corner stone it was decided to have the ceremonies connected therewith at the time of the dedication of the building The corner stone was put in place and a block of marble placed over it so that it is possible to remove the corner-stone and place therein the copper box containing the records and this will now be done

He called on former president W Bruce Philip, who would have had the privilege of laying the corner stone if the ceremonies had taken place last year, to ac ompany him for the purpose of placing the copper box in the corner-stone

This was done in due form and Chairman Hilton, on behalf of the AMERICAN PHARMACEUTICAL ASSOCIATION, thanked those who were in attendance on this auspicious occasion The musical program for the occasion was rendered by Goldman Band, the program opening with America ' and closing with ' Star Spangled Banner

---

THE ANNUAL BANQUET OF THE AMERICAN PHARMACEUTICAL ASSOCIATION AND THE PRESENTATION OF THE REMINGTON HONOR MEDAL TO SIR HENRY S WELLCOME

More than five hundred members, ladies and guests were seated at the banquet tables on Tuesday evening, May 8th The occasion was the annual dinner of the AMERICAN PHARMACEUTICAL ASSOCIATION and of affiliated organizations, and the presentation of the Remington Honor Medal to Sir Henry S Wellcome, of London, by the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION The delightful function took place at the Shoreham Hotel, President R L Swain pre siding as toastmaster The presentation ceremonies were preceded by vocal solos by Mr Carson P Frailey, secretary of the American Drug Manufacturers' Asso ciation and president of the National Drug Trade Conference, and vocal solos by Mr S O Christie, also a pharmacist The Board of Commissioners of the District of Columbia was to have been represented by Hon M C Hazen, its chairman, who was prevented by important business and he requested Samuel L Hilton to speak for him, who did so briefly in the following words

REMARKS BY S L HILTON

Mr Toastmaster, Ladies and Gentlemen

"Just a short while ago I received a telephone message from Commissioner Hazen that he would not be able to be present, and as a result I am called upon to pinch hit for him Do not expect a home run, that is impossible, if I make a base hit I will feel satisfied

"On behalf of the Commissioners of the District of Columbia I extend you a most cordial greeting and hearty welcome to the Capital City

"On such occasions as this I know it is customary to present you with the key of the city, lack of time for one thing and the fact that we have no key to the city prevent such a formality The Capital City is your city—you require no key to enjoy its hospitality and you are always welcome

"In extending the greetings of the Commissioners of the District of Columbia, they wish you every pleasure the city affords, and a most successful convention They are much pleased that your magnificent new building, occupying the prominent position it does, facing the Lincoln Memorial and the Arlington Memorial Bridge and in which they have been so deeply interested, will be dedicated on this occasion

"We extend you a hearty welcome on all occasions and trust you will visit the Capital City again in the near future and that you will carry home with you the most pleasant recollections of your visit

"I thank you "

Augustus C Taylor speaking as president of the District of Columbia Pharmaceutical Association said

Mr Toastmaster, Sir Henry Wellcome, Honored Guests and Friends

I thank you for this opportunity to extend greetings from the officers and members of the District of Columbia Pharmaceutical Association We consider it a great privilege to have this chance to act as host to the oldest and most honored pharmaceutical association of our country We are likewise proud of the same privilege to act as host to those allied associations that are holding their conventions or conferences at the same time

We welcome you to your capital—Washington the City Beautiful—the city that after the dedication to-morrow of that beautiful building, the American Institute of Pharmacy, will in reality become the home of Pharmacy in America

The presentation of the Remington Medal and the dedicatory exercises to-morrow will long be remembered by the members of our ASSOCIATION and we will always be proud of the part taken by the District of Columbia Pharmaceutical Association toward making these events a success

The District of Columbia Pharmaceutical Association is almost as old as its beloved parent association but with an age of 76 years it is still going strong Founded in 1858, records show continued activities, excepting the period of the Civil War, to the present time Looking back over this long period we find this association always in the front rank striving to improve the standing of Pharmacy At all times we find members of our Association working in some way or another to protect the welfare of the members of our profession

Many of our members have been honored with high offices in the AMERICAN PHARMACEUTICAL ASSOCIATION or allied associations Five have been president of the A Ph A John S Kidwell 1858–1859, W S Thompson 1893–1894, Oscar Oldberg 1908–1909, S L Hilton 1921–1922, W B Philip, a Californian when chosen, but a member of our Association during his term of office—1932–1933 W H Bradbury served as president of the Federal Wholesale Druggists' Association, F T Stone of the N A R D , and A C Taylor of the N A B P Many of

our members hold the chairmanship on important committees in all the National associations

As your host we wish you to have a good time and a successful convention and it is our hope that you will want to come again This is not the first time the A PH A met in Washington and we trust it will not be the last

This city is a great place for conventions A fortnight ago we had a grand gathering of medical men, last week a large group of nurses from all over the country graced our city, this week we have this wonderful gathering of pharmacists, and we will be followed in the near future by the undertakers

Thank you

After the conclusion of the dinner, which was enjoyed by the participants of the feast, the toastmaster presided over the presentation ceremonies for New York Branch, A PH A

Sir Henry S Wellcome, Remington Medalist

Inscription on Remington Medal

Joseph P Remington—Face of Medal

REMARKS OF ROBERT L SWAIN

We now come to the impressive feature of the evening—awarding the Remington Honor Medal This medal, given in memory of that great pharmaceutical teacher and leader, Professor Joseph P Remington, was established by the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION The award has heretofore been presented at some function of that body This year, however, in recognition of the unusually distinguished recipient and the fact that he was in attendance at this convention, the New York Branch has done the ASSOCIATION the courtesy of making the award at this meeting

Dr Charles W Ballard, president of the New York Branch, would have made the award, but he is compelled to be absent because of the serious illness of his father Dr Hugo H Schaefer, in whose mind the Remington Medal was first conceived, was to have acted for Dr Ballard, but, at the last moment, Dr Schaefer found it would not be possible for him to reach Washington until to-morrow afternoon And so, I shall act for the New York Branch in the remainder of the evening program

The Remington Honor Medal for 1934 has been awarded to Sir Henry S Wellcome, truly one of the most distinguished citizens of the world This medal is awarded annually to that pharmacist making the most valuable contribution to pharmacy either in the year preceding or in a collective sense over a period of years Sir Henry meets every qualification which could be set up, and he richly merits the

honor He is not a stranger to distinction Recently he was knighted by his King in recognition of his great contribution to humanity He is a pharmacist of international renown A British subject, his interests have embraced the world, and his benefactions have brought life and happiness to the people of every land He loves science largely for herself alone, and his research projects have added much to scientific knowledge and to an understanding of great scientific truths He loves science, too, because of her contributions to medicine, chemistry, pharmacy and sanitation, all of which so closely affect human beings and the conditions under which they live

Sir Henry has given lavishly of his time, lavishly of his fortune and lavishly of his heart that medical science might develop and expand He has established great research laboratories for the study of health and medical problems His objective has been to make life a richer, fuller and deeper thing

He long since ceased to belong to one country He has become as universal as the science to which he is so greatly devoted The bigness of his heart, the embraciveness of his mind, the universality of his humanity have made him a citizen of the world and the benefactor of peoples everywhere In honoring Sir Henry S Wellcome, pharmacy in a much truer sense honors itself It is a recognition of the great debt we owe him, and a recognition, too, of his far-flung philanthropies in the field of public health As he has made life more abundant for others, so has he created in us a higher ideal and a sounder conception of the real aims and purposes of our profession

After the conclusion of these remarks the chairman introduced Robert P Fischelis, as a former president of New York Branch, A Ph A

Mr Leander McCormick-Goodhart, representing the Ambassador of Great Britain, was then introduced, he spoke as follows

Mr Chairman, Sir Henry Wellcome, Members of the American Pharmaceutical Association

It is the old, old story When I had the pleasure of talking over the telephone this morning to Dr Kelly, your secretary, there was a reciprocal understanding that if I attended your dinner this evening I would not be called upon to address you The result is that here I am standing on my feet As representing the British Ambassador, my message is a brief but very sincere one Sir Ronald Lindsay asked me to extend to you his very cordial greetings and his profound regrets that he was unable to be with you this evening owing to an unavoidable engagement elsewhere Sir Ronald would have been glad to be here, not only on account of the pleasure which it would have given him to see his distinguished compatriot honored by the award of the Remington Medal, but also for other reasons He would have wished to be here in order to congratulate you on the opening to-morrow of your superb new building which occupies one of the finest sites of the city nearly opposite to the noble Monument of one of your greatest Presidents He would also have appreciated being at a dinner held by what he understands to be one of the oldest scientific associations in the United States And, lastly, he would have been especially glad to be here as, since I am informed by the chairman, the Pharmaceutical Association is the one organization which is not permitted to make mistakes We

diplomats often make mistakes and it is evident that we have a great deal to learn from yourselves

If I may be permitted to make a personal reference, I have been interested in pharmacology for the last 39 years It began this way The chairman has referred to my being an adopted Marylander, but 39 years ago I was a small boy playing in a sandlot in a little village in the mid-West—Chicago I got a pain The doctor came to see me It turned out to be the appendix He was a Homeopath and he gave me some delicious little pills which cured the trouble It was a great opportunity to study the physiology of the effect of drugs on the human system! Well, for 38 years those little pills did their trick, but last year they failed me and I was obliged to have it out

I wonder whether any of you have ever thought of a connection between pharmacology and poetry Perhaps some of the charming ladies here present have thought of it in this light In 1823 one of the most distinguished of British poets, Lord Byron, was in Florence He went into a drug store and presumably bought himself something But he carried away from the drug store a printed advertisement of one of the preparations sold in there, and he took this advertisement back to his lodgings in Genoa He eventually threw the advertisement into the wastepaper basket but not without having written one of his immortal poems on it consisting of about twenty lines I hold it up here for you to see Unfortunately it is so illegible that I am unable to read it This little incident surely proves the nobility of the art to which you have devoted yourselves!

It has given me a great deal of pleasure to be present with you this evening I thank you very much

The toastmaster introduced Charles Moore chairman of the Commission of Fine Arts, who spoke as follows

Mr Chairman, Sir Henry Wellcome, Members of the Association

From going to and fro in the earth and from walking up and down in it, occasionally one meets great men Such may be divided roughly into those one knows and those who know him I have been asked to speak words of greeting because of a belief that I both know and am known by that great benefactor of the human race, our guest, Sir Henry Wellcome

I met him first about the end of the World War, in the hospitable home of Dr and Mrs Charles W Richardson, in one of the small companies Dr Wellcome insisted upon before accepting an invitation The scene rises before me as a dream The white flowers on the table, the mellow light of the candles falling softly on the dark hair of Dr Wellcome as with bent head he quietly told of his first experience with malaria by a virulent infection from a mosquito at Panama, and of a second equally virulent infection from a similar cause on the upper waters of the Amazon Told also the tragic tale of Gordon's beneficient rule in the Egyptian Sudan, of his assassination by a hired traitor, the massacre of the heroic garrison of Khartoum and the sixteen years of devastation during which every vestage of civilization was wiped out and more than twelve million men, women and children were ruthlessly slaughtered At the time of Lord Kitchener's final victory over the devastating Dervishes a large portion of the population was suffering from tropical fevers, and thousands of Kitchener's own men were stricken by mosquito-borne diseases

Modestly he told us that he was one of the first civilians, after Kitchener's reconquest, to journey to the Upper Nile to study conditions in the Sudan As a result he offered to equip complete tropical research laboratories as adjuncts to Gordon College at Khartoum His camel caravans carried help by land and a floating laboratory bore relief up the many Nile tributaries

In all this welfare work there was a spice of romance, for this region was once the kingdom of the Queen of Sheba, whose visit to King Solomon is so severely reprehended by sex-moralists of to day The capital of her Ethiopian kingdom, Dr Wellcome was then excavating with a force of several thousand Sudanese He had not as yet found her jar of cosmetics

I suppose that Dr Wellcome (as he then was) and I were drawn together by the fact that the two Squibbs, father and son, were my close friends, as was also Frank Ryan of Parke, Davis & Co , and that I had known both Mr Parke and Mr Davis

Incidentally I may note the coincidence that as the Wellcome Medical Museum in London is built on the foundations laid by Burroughs, Wellcome & Co , so the Freer Gallery of Far Eastern Art, here in Washington, each preeminent in its special field, was financed and is maintained largely from the profits of Parke, Davis & Co The restorative qualities of pharmacy reach even into the fine arts Sir Henry's new Research Institution in London would be at home architecturally with the Government buildings now under construction here in Washington

Next, I met our guest at a little dinner given by Mrs Gorgas—Lady Gorgas, by rights—widow of Surgeon General William C Gorgas, whose achievements in sanitation are commemorated in the Gorgas Memorial Institute of Tropical Medicine at Panama That out-post in the strife for health among our southern neighbors owes its very existence to the example of Sir Henry Wellcome and to his testimony before the House of Representatives Committee on Foreign Affairs on January 20, 1928 When others doubted or hesitated, Dr Wellcome had powerfully supported Dr Gorgas in Panama

I was honored by being one of the six or seven guests at a luncheon given by Dr Wellcome to Sir St Clair Thompson, then president of the Royal Medical Society of London—a Scotchman with a rare sense of humor Also I attended the large and brilliant luncheon he gave to his fellow-working archæologist, Professor Reisner

Latterly our meetings have been occasional indeed, but always with the cordiality that knows no intermissions of time or distance While visiting Washington he intrenches himself in his fastness, where he is ever plotting some new scheme for doing good Too often we, his friends, are reminded of Lowell's changeling—"we only know he came and went "

From the inception of the project for building your Pharmacy Building, Sir Henry has been vitally interested in it in its location, its design and its surroundings Possibly it speaks to him of his birth in Wisconsin, of his training in Chicago and Philadelphia, of his early travels on this hemisphere from Alaska to the equator At any rate it shows that his change of skies implies no change of heart So, Sir Henry Wellcome, benefactor of humanity in four continents, we greet you

Secretary R B J Stanbury of the Canadian Pharmaceutical Association was introduced as the next speaker, his remarks follow

Mr President, Members of the American Pharmaceutical Association, Sir Henry Wellcome, Ladies and Distinguished Guests

I bring to you the congratulations and felicitations of the president, officers and members of the Canadian Pharmaceutical Association on this auspicious 82nd Annual Convention of your ASSOCIATION

Here you are assembled in your national capital with its historic environs and its rich traditions, to deliberate on the pharmaceutical problems of this country We, in Canada, look on this parliament of American Pharmacy with more than passing and casual interest, for whatever decisions you arrive at have their reper cussions in our country

Two years ago we had the pleasure of welcoming you to the city of Toronto It was the occasion of the 25th anniversary of the Canadian Pharmaceutical Asso ciation and this reminds me that in 1877 you celebrated your 25th anniversary in the city of Toronto and elected a Canadian, the late William Saunders, as president of the AMERICAN PHARMACEUTICAL ASSOCIATION

This meeting in Toronto in 1932 was a unique and delightful event We had representatives of the three great English-speaking pharmaceutical bodies of the world—England, United States and Canada We were able at close range to get the viewpoint of each other and gain a clearer understanding of the aims and objects of our various associations

That meeting will always live in my memory and I believe will always be cher ished by those who were fortunate enough to be present

I am glad to be here to-night and to have the honor and opportunity of joining with you in greetings to Sir Henry Wellcome He is home on his native heath, re ceiving the warm-hearted and affectionate tribute of those who have watched his development from an apprentice lad in a frontier settlement of Minnesota all through his years of study and research and his intense interest in ethnological and archæological subjects

Sir Henry has been honored by membership in many scientific and medical societies and has had degrees conferred on him by several universities

King George created him a Knight in 1932 This evening you will present him with the Remington Medal, the highest honor the profession of pharmacy in America can bestow, which I believe Sir Henry will consider the crowning glory of his career

Sir Henry—you have conducted research in South America, you have explored the upper regions of the Nile, you have delved into the history of medicine and car ried on research in medicine, but in all your research and exploration, I do not be lieve you have heretofore found the priceless jewel you have discovered at this banquet to-night—the friendship and love of your fellow pharmacists

Up from the day of small beginning
Out to the wide world's utmost ends
There's nothing worth the while of winning
But friendship and the love of friends

I hope you will live, Sir, for many years to enjoy your well-earned honors and to pursue your research in the interests of science, and for the benefit of humanity

Dr Robert P Fischelis a former president, delivered the message of President C W Ballard, of the New York Branch A PH A —it follows

"While in modern times the universality of science transcends both political boundaries and racial differences, it is only in that branch of science dealing with the art of healing that this common accord has prevailed almost unbroken from antiquity Practitioners of medicine in early times regarded service as one of the obligations of their calling and so it remains to-day Empiricism has given way to rationalism in therapeutics, unsubstantiated opinions have been replaced by certainty and accuracy in diagnosis, but service to mankind still remains a motivating factor in medicine and its closely allied calling—pharmacy This service is extremely varied in its scope and the manufacture of suitable remedial agents contributes in no small measure to the armament of the physician in his unceasing war on disease When, as in several instances, the pharmacist in his efforts to perfect medicaments undertakes extensive research projects, either personally or by unstinted support, he strengthens the bonds between medicine and pharmacy and, what is of greater import, he immeasurably increases the service these callings can render mankind

"It is eminently fitting that the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION, through the establishment of the Remington Honor Medal should commemorate one who labored long and earnestly for American pharmacy It is for meritorious service in pharmacy and wisely without restriction as to the nature of this service thus recognizing the various activities within the scope of our calling If my recollection is correct, this is the first instance of its award to one other than a citizen of this country In its bestowal upon Sir Henry Wellcome we not only recognize his labors in pharmacy but also establish a precedent which prevails in the award of the Hanbury Medal of the British Pharmaceutical Society I consider myself singularly fortunate in a long association with one who has been so honored by the pharmacists of Britain, and to you, Sir Henry, I bring this letter of felicitation from an American Hanbury Medalist—Dr Rusby

"And now I turn to those who can adequately speak of the widely diverging interests of the Remington Medalist of 1934, Sir Henry Wellcome

"It is a happy coincidence that he, who is senior among the past presidents of the New York Branch in attendance on this occasion, should be a graduate of the Philadelphia College and at a time when Professor Remington was a member of that faculty As president of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION, I request Dean Arny to award the Remington Medal to Sir Henry Wellcome "

THE PRESENTATION OF THE MEDAL

Dr H V Arny opened his remarks by expressing regrets over the unavoidable absence of his predecessors as chairman of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION Messrs Diner, Raubenheimer, Diekman and Bigelow, extending their personal greetings and their regrets

He then spoke of the life of the 1934 recipient of the Remington Honor Medal as one of the world tales of American Pharmacy, a story which he delights to recite each year to the pharmacy students at Columbia Henry S Wellcome, son of an American pioneer, a pioneer in his own right, the boy of eight who followed the

covered wagon of his father from Wisconsin to Minnesota, the lad who was the playmate of the now famous Mayo Brothers of Rochester, the apprentice in the drug store of the father of these two gifted men, the student at Philadelphia who sat at the feet of Procter, Maisch and Remington, the eminently successful business man in England and throughout the world The British philanthropist and archæologist who received the accolade of Knighthood from his appreciative Sovereign

The Remington Medal was then presented with the following words

Sir Henry In the name of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION I have the great honor of presenting you with this, the 1934 Remington Honor Medal I congratulate you upon receiving this distinction I congratulate the AMERICAN PHARMACEUTICAL ASSOCIATION upon so worthy a son of American Pharmacy, so faithful a member of our ASSOCIATION, so eminent a citizen of the world upon whom to bestow the highest gift that it offers its sons and daughters

Sir Henry S Wellcome, the recipient of the Medal, briefly and feelingly acknowledged the honor, referring to Professor Remington as member of the faculty of Philadelphia College of Pharmacy when he was a student of that institution He also paid tribute to William Procter, Jr , John M Maisch, Robert Bridges and other pharmaceutical educators of that period He concluded with words of thanks and appreciation and accepted the Medal as a distinctive honor

This concluded the ceremonies of the evening and many of the guests of this interesting event remained to enjoy the ball and program of music arranged for them by the Entertainment Committee

DR CHARLES MOORE

DR H A B DUNNING

The chairman of the present Campaign Fund Committee has been asked to assume the chairmanship of the Maintenance Committee for the American Institute of Pharmacy

PROCEEDINGS OF THE LOCAL BRANCHES

'All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association except with the consent of the Council" —Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads The objects and aims of local branches of this Associa tion shall be the same as set forth in ARTICLE I of the Constitution of this body *and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By-Laws of this Association '

ARTICLE IV of Chapter VII reads Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting and the proceedings of which shall have been submitted to the JOURNAL for publication may elect one representative to the House of Delegates"

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter

BALTIMORE

The regular monthly meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson Monday, April 23rd, at 8 15 P M , Vice-President Reindollar in the chair

The Chair called for a report of the last meeting which was read by the secretary An nouncement of the chairmen of the standing committees for the year was made as follows *Com mittee on Membership* Gilbert Joseph, *Committee on Professional Relations,* Simon Solomon, *Com mittee on Science and Practice of Pharmacy* Robert S Fuqua, *Committee on Education and Legis lation* A G DuMez

A communication from Secretary E F Kelly of the A PH A was read Dr Krantz in troduced the speaker of the evening Dr A R L Dohme who spoke on Germicides" He traced the early work of Pasteur Koch and Klebs and other famous bacteriologists and related how the first germicides were developed He mentioned the early work on iodine, iodoform, mercury, gold, the dyestuffs, Atoxyl, Ehrlich's 606 phenyl mercuric nitrate, the phenol germicides, the organic mercurials, chlorine compounds, and finally related in an interesting way the discovery of the anti septic properties of the alkyl resorcinols

At the conclusion of the address a rising vote of thanks was tendered Dr Dohme

Before closing the meeting a vote was taken on the appointment of a delegate and an alter nate to the House of Delegates of the AMERICAN PHARMACEUTICAL ASSOCIATION at the May meet ing President B Olive Cole was elected to serve as delegate and Secretary Treasurer C Jelleff Carr was elected to serve as alternate

C JELLEFF CARR *Secretary Treasurer*

CHICAGO

The monthly meeting of the Chicago Branch was held Tuesday, April 17, 1934, at the University of Illinois College of Medicine

The speaker of the evening was Dr Bernard Fantus, assisted by the Misses Hattie and Josephine Dyniewicz

Dr Fantus chose as his subject "A Study of Vehicles for Medicines"

Each member of the audience was presented with an outline of the vehicles to be discussed

Dr Fantus began his discussion with the statement that he thought medicine in a solid form had many advantages over those of liquid form but that we must have good vehicles for medicines not subject to solid administration

Some of his outstanding remarks were—the hope that the day will soon come when no nasty medicine will be prescribed that there is almost a specific vehicle for every medicament

It was shown with Syrup of Acacia that colloidal substances lessen the sharpness of taste of drugs The syrup was flavored with oil of wintergreen

Artificial Syrup of Cherry was presented it being proposed that we need more fruit flavors that this syrup is always uniform and quite suitable for the administration of acids Hydrochloric acid was used to demonstrate its masking properties

Syrup of Chocolate, with oil of theobroma added, was discussed The Pure Food and Drug Act allows the syrup to be called 'of chocolate" only when the oil is present

Syrup of Cinnamon—artificial, was next presented This syrup was proposed to have the advantage over the present U S P product in that the tannins of the crude drug would not be present The syrup was made by saturating syrup with the oil of cinnamon Iron and ammonium citrate were used to show the power of masking of taste of the syrup

Aromatic Syrup of Eriodictyon was exhibited as the best vehicle for alkaloids " It was shown that the disguising property of the syrup lies in the resins of the drug

Syrup of Strawberry—this syrup was made from the natural fruit juice and methenamine was used as the medicament to show its power of disguising taste

Aromatic Syrup of Glycyrrhiza was suggested to take the place of the present N F formula It was propounded that only the first fifty per cent of extraction be used in order to avoid the extraction of the acrid principle The revised formula would also contain an anise bouquet to enhance the taste of the glycyrrhiza Salty medicaments were used to show the special disguising powers of the syrup

Compound Syrup of Sarsaparilla was shown to become much clearer with the reduction in quantity of oil and Syrup of Bromides N F was cited as an example

Isoelixir an elixir of the same alcoholic concentration as the menstruum of the preparation for which it is to serve as the vehicle was demonstrated This elixir is made by mixing in the correct proportions 'Elixir Aquosum and "Elixir Alcoholicum "

Alkaline elixir of Eriodictyon was suggested as a new formula requiring a vehicle of a high alcoholic concentration

It was shown that many bitter substances more soluble in alcohol than in water lose their bitter taste in proportion to the higher per cent of alcohol present in the vehicle

Phenobarbital was shown as an example where this holds true

Dr Fantus concluded the report by answering the questions of the audience and inviting those present to inspect and taste the vehicles presented

LAWRENCE TEMPLETON *Secretary*

A paper on 'The Coöperation of the Hospital Pharmacist and Staff " by William Gray has been received and will be published in a later issue of the JOURNAL Articles by Dr Bernard Fantus and co workers on vehicles must also be deferred to a succeeding number —*Editor*

NEW YORK

The length of this interesting report prevents complete publication in this issue of the Journal

A meeting to commemorate the Fiftieth Anniversary of the New York and Brooklyn Formulary was held by the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION on Monday evening, April 9 1934 As usual the meeting took place in the College of Pharmacy, Columbia University About seventy five members and their guests attended

After the meeting had been called to order by the President Dr Ballard the report of the secretary was heard This was read, amended and accepted The treasurer's report was read

Due to the illness of Mr Lehman, a report from the Committee on Education and Legislation was rendered by Mr Dyer His report follows

Assembly bill 417 amending the pharmacy laws by permitting the Board of Pharmacy to control the manufacture and sale of all medicines (including proprietaries) which are of a poisonous, deleterious and habit-forming nature has been passed in assembly The original bill called for 'containing poisonous deleterious and habit forming ingredients" but it was amended in the assembly this has weakened the bill The prospects for its adoption by the Senate are good

National Recovery Administrator Hugh S Johnson has issued an order, effective April 8th tightening the loss limitation" provision in the code for the retail drug trade The order reads

Inasmuch as the vast preponderance of drug store products is distributed through small drug retailers who are unable to purchase on a quantity basis but who perform services which are essential to the welfare of those in their communities, and whereas such services cannot adequately be performed through the facilities provided by their competitors, and whereas, in some cases sales are made to consumers by such competitors at prices below the lowest cost of purchase normally obtainable for such merchandise by small drug retailers and whereas in most instances such sales prices are not a true indication of the general level of prices of such competitors and no general benefit to those in the community accompanies the same, but such prices are in fact in the nature of bait offers of merchandise to attract trade, it is hereby declared an unfair trade practice and is prohibited by this code for any drug retailer to sell any drugs, medicines cosmetics toilet preparations or drug sundries at a price below the manufacturer s wholesale list price per dozen, provided, however that in the case of biologicals or other of the above mentioned products which are not customarily sold in dozen or greater lots the Code Authority may fix a comparable unit quantity and provided further that any discount free deal or rebate which is made available to all purchasers of dozen lots or comparable quantities, shall be considered as part of the manu facturer s wholesale list price '

Following Mr Dyer's report considerable discussion developed in which Messrs Wm C Anderson E F Kelly J Seley and Fred Schaefer took part

Chairman Kassner, of the Professional Relations Committee next reported on the Physicians and Pharmacists' meeting recently held by the Academy of Pharmacy at the Academy of Medicine

A special report was received from Chairman H H Schaefer, of the Remington Medal Committee, who announced that Sir Henry Wellcome had been awarded the Remington Medal for 1934, the presentation to take place at the Convention of the AMERICAN PHARMACEUTICAL ASSOCIATION in Washington

The chairman then proceeded with the special program for the evening and called upon Dr Charles F Schleussner, one of the two surviving members of the original New York and Brooklyn Formulary Committee to tell about the early organization and development of a formulary which has grown to become the National Formulary (This will be printed in a later number of the JOURNAL)

A letter from Dr John Uri Lloyd commenting on the occasion was then read The complete text of the letter will be included in a further report —*Editor*

Dr H V Arny was next called upon to represent the New York College of Pharmacy Dean Arny called attention to the exhibit of all editions of the National Formulary, the New York and Brooklyn Formulary and to Lloyd's Elixirs which were on display Several of these books had been presented by members of the early formulary committees Dean Arny went on to say that the Formulary Committee membership list was literally made up of a pharmaceutical hall of fame with such names as Ebert, Hallberg Hoffmann and others Dean Arny also discussed briefly the methods employed for carrying out revisions of the National Formulary and he closed his remarks by explaining the broadening of scope which had taken place

A brief communication relative to the celebration from Dr Robert L Swain President of the AMERICAN PHARMACEUTICAL ASSOCIATION, was now read

Following this President Ballard introduced Dr Evander F Kelly, secretary of the AMERICAN PHARMACEUTICAL ASSOCIATION who addressed the meeting This is held over for a later report

After Secretary Kelly's address letters from Chairman Gathercoal and Secretary Nichols of the Sixth Revision Committee of the National Formulary were read Chairman Gathercoal had also submitted a report on progress of revision This will be reported later

Following this there was some slight discussion and after a rising vote of thanks was extended to all speakers, Mr Fred Schaefer called the meeting closed

RUDOLF O HAUCK, *Secretary*

PHILADELPHIA

The April meeting of the Philadelphia Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held in the auditorium of the Philadelphia College of Pharmacy and Science, April 10 1934

President Barol called the meeting to order, and the minutes of the previous session were read and approved In the absence of the chairman of the membership committee Dr Frank Eby proposed the following for membership in the local branch F R Greenbaum, David J Phillips and Albert C Moreau

President Barol then announced the committee appointments for 1934–1935 *Committee on Practical Pharmacy Chairman*, Quintus Hoch, Leo G Penn, George T Pickett *Committee on Professional Relations Chairman*, H Everett Kendig, Wilmer Krusen, W L Cliffe *Committee on Membership Chairman* George K Schacterle, Frank H Eby, Frank F Law, W J Stoneback, Harvey P Frank, Adley B Nichols *Committee on Entertainment*, George E Byers, *Chairman*

The principal speaker of the evening was Sergeant W C Leinhauser Chief of the Narcotic Squad of the Philadelphia Bureau of Police, who spoke on the illicit trade in narcotics in the vicinity of Philadelphia

He began by displaying various opium pipes devised by opium smokers from such common place articles as beer bottles, perfume bottles and tin cans easily destroyed when expecting a visit from the narcotic agent It was explained, however that opium smoking is a thing of the past most of the addicts now using crude hypodermic injections of morphine

Between 2000 and 3000 addicts and former addicts are now living in the vicinity of Philadelphia and among the last 200 arrests 90 per cent had been arrested three or more times for larceny Theft is the chief means the addict uses to obtain funds for narcotic drugs

Sergeant Leinhauser described the various methods used by traffickers in narcotics in smuggling them into the city Most of Philadelphia's supply is brought from New York and peddled in small amounts to users the packages often being disguised as various insignificant articles

The speaker made an appeal to the pharmacists of Philadelphia to aid in the enforcement of the narcotic act by observing the following precautions

1 Maintain careful narcotic records

2 Keep narcotic drugs in a locked cabinet at all times

3 Carefully scrutinize every narcotic prescription and the person who presents it In case of doubt as to authenticity, delay filling the prescription until the narcotic squad is notified

During the discussion after the talk Sergeant Leinhauser gave the following information

During his nine years as Chief of the Narcotic Squad he has made no seizure of codeine and knows of no primary codeine addicts

Since the Pennsylvania enactment against the use of Marihuana (referring to Cannabis) 30 persons possessing it have been arrested in Philadelphia Its use is mainly confined to the poor negro classes Sergeant Leinhauser has smoked this drug as an experiment but received no effect whatsoever

The selling of narcotics to school children is a myth and merely represents perennial material for newspaper stories Of the 175 to 225 arrests of users in this vicinity only a few are under 21 years of age

Very little opium is used by the Chinese population of Philadelphia and Chinese users do not abuse the habit The Chinese do not permit white people to frequent their quarters It is the opinion of Sergeant Leinhauser that once a person has become an addict he always comes back to the habit, even when supposedly cured

At the close of the meeting a rising vote of thanks was accorded Sergeant Leinhauser

E H MacLaughlin *Secretary*

PITTSBURGH

The Pittsburgh Branch of the American Pharmaceutical Association celebrated the twenty fifth anniversary of its founding with a dinner and joint session of the Pittsburgh Branch and the Pittsburgh College of Pharmacy Students' Branch, Tuesday April 10 1934

Dinner was served to seventy five members and guests at the Hotel Henry President Raymond Hornfeck introduced Robert R Gaw as toastmaster In his introductory remarks Mr Gaw stated that the 'Pittsburgh Branch was founded twenty five years ago at the Pittsburgh College of Pharmacy pursuant to the action of the Board of Trustees and that Dr Julius A Koch served as first president B F Pritchard was elected first secretary but resigned very

shortly after election and Dr Louis Saalbach was elected to fill the vacancy Dr Saalbach served as Secretary Treasurer until February 19 1929

The chairmen of the first committees were *Membership*, William R Bell, *Practice*, Louis Emanuel *Medical Relations* Albert F Judd *Education and Legislation*, John R Thompson, *Publicity*, James H Beal

Mr Gaw read a communication from Dr Julius A Koch to the effect that 'he would be absent from the city on the 10th and could not take part in the celebration of the twenty fifth anniversary of the founding of the Pittsburgh Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION'

A communication from the parent body extending congratulations to the Pittsburgh Branch on the completion of twenty five years of useful service to Pharmacy was signed by R L Swain, E F Kelly and E G Eberle

The toastmaster called first on Dr Albert F Judd to tell something about early experiences of the society Dr Judd told about the contacts made with medical practitioners and problems encountered in the early period

Dr Louis Saalbach continued the relation of facts and told how the Pittsburgh Branch grew to its present position among pharmaceutical societies

Dr George D Beal Assistant Director of the Mellon Institute of Industrial Research, delivered the principal address He outlined the early history of the Branch and indicated the importance of the various local branches in the work of the parent association, he read excerpts from the code of ethics of the AMERICAN PHARMACEUTICAL ASSOCIATION to illustrate the fact that its principles are so fundamental and basic that they apply equally as well to day as they did when adopted over eighty years ago Dr Beal also pointed out the necessity for organization in our present economic scheme illustrating the need for local state and national units, but clearly indicated the inherent danger of duplication of these units Dr Beal concluded by paying a glowing tribute to outstanding men in Pharmacy telling of his experience with some he had known personally pointing out that the various callings are not professions in themselves but become so according to the character of the men in them

President Albert Gabig of the Student Branch of the Pittsburgh College of Pharmacy, responded on their behalf

Dean C Leonard O Connell responded for the Pittsburgh College of Pharmacy Announcement was made that a meeting would not be held in May, but meetings will be resumed in September, 1934

FRANK S MCGINNIS, *Reporter*

A A C P AND N A B P DISTRICT NO 6

The Boards and Colleges of Pharmacy District 6 met in Fort Worth, Texas March 22nd in a one day session E M Joseph *national vice president*, presided over the meeting C B Allison, Dallas, Texas C M Brewer, Oklahoma City, H H Horst Stuttgart, Ark, Dr D B R Johnson Norman, Okla Frank A Milne, Pratt Kansas John A Weeks Ballinger, Texas Herbert W Parker Jonesboro, Ark, Dr W F Gidley Austin Texas, and Mac Childs Eldorado Kansas addressed the meeting, which followed a regular examination of the Texas Board at which time 210 applicants presented themselves

Herbert W Parker read a paper on 'The Difference in Examinations after Prerequisite Laws Become Effective' which was well received Social features included a banquet in honor of the visiting delegates at the Blackstone Hotel at which Josh Lee, the sage of the Southwest, was principal speaker, followed by a dance given by the druggists of Fort Worth The Texas Board of Pharmacy entertained with a luncheon in honor of the delegates and the druggists of Dallas entertained with a stag party at the Blackstone

CONSTITUTIONALITY OF DELAWARE PHARMACEUTICAL LAW

A test case is being made which involves the constitutionality of the Delaware pharmacy law on motion of Peoples Drug Stores, Inc, to quash an indictment charging the Company with alleged violation The Delaware statute is very similar to the former Pennsylvania Ownership law

ASSOCIATION BUSINESS

THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934–1935

Office of the Secretary 2215 Constitution Ave , Washington, D C

LETTER NO 9

May 7, 1934

To the Member of the Council

The Second Meeting of the Council for 1933–1934 was held in the Shoreham Hotel, Washington, D C on Monday, May 7, 1934, beginning at 9 30 A M , with the following members present Hilton, Swain, Adams, Caspari, DuMez, Christensen, Eberle and Kelly

54 Committee on Finance The following report was submitted by Chairman Swain

The undersigned has attempted to carry on as best he could the splendid work done for a number of years by former Chairman Bradley and desires to record his appreciation of the effective services of Dr Bradley The financial affairs of the ASSOCIATION are conducted principally by Treasurer Holton and Secretary Kelly, with whom the chairman and members of the Committee have cooperated as fully as possible

'The routine work of the Committee has been carried on as heretofore and the Committee has no recommendations to submit

' In submitting the Budget for 1934 (See Item No 30 Council Letter No 5) a complete statement with respect to income and disbursements was given At that time an estimated list of receipts for 1934 was made and the Committee is gratified to report that if the ratio of receipts to April 30th is continued for the year, the estimated receipts will be realized The expenses for the period to April 30th are also being kept within the appropriation It is impossible as yet to give accurate information as to the cost of maintenance of the Building and this item will therefore be discussed later The expense of transferring the offices of the ASSOCIATION from Baltimore to Washington were charged to Miscellaneous Expenses and it probably will be necessary later to ask for an addition to this appropriation

The estimate of receipts provided for the transfer of $4500 from the accumulated interest of the Life Membership Fund to the Current Fund to balance the Budget It is too early in the year to estimate how much, if any, of this amount it will be necessary to transfer

The Committee believes the ASSOCIATION to be in an entirely sound condition financially '

The report was accepted on motion of Adams—Caspari and after a general discussion of the finances of the ASSOCIATION

55 Committee on Property and Funds Chairman Swain submitted the following report

In accordance with Article VI of Chapter IV of the By-Laws of the Council, the Committee on Property and Funds submits its report The Committee recommends to the Council the following banks and safe deposit vaults

DEPOSITORIES FOR FUNDS

The Baltimore Trust Company, Baltimore Md
The Baltimore National Bank Baltimore, Md
The Maryland Trust Company Baltimore, Md
The Merchants and Newark Trust Company, Newark, N J
The Boston Penny Savings Bank, Boston Mass

DEPOSITORIES FOR SECURITIES AND RECORDS

The Baltimore National Bank, Baltimore, Md —Safe Deposit Boxes
The Maryland Trust Company Baltimore, Md —Safe Deposit Boxes
The Merchants and Newark Trust Co , Newark, N J —Safe Deposit Boxes

'The Committee is pleased to again report that interest has been paid on all securities owned by the ASSOCIATION with one exception Interest on a $1000 Bond, due May 31, 1933, of the City of Detroit, in the Life Membership Fund, and amounting to $40 was not paid, interest due on this Bond on December 1933, was paid and no doubt the interest in default will be paid later

'As reported in Item No 24, Council Letter No 4, November 27, 1933 certain series of the Fourth Liberty Loan Bond 1933–1938, were called for payment at par on April 15, 1934 In accordance with motion passed by the Council, the treasurer and secretary sold these bonds at 101 and purchased uncalled coupon bonds of the same issue to replace at $101^{21}/_{32}$ Coupon bonds were purchased because they brought a slightly better price and because of the difficulty of transferring registered bonds as further issues are called Two $100 coupon bonds in the Headquarters Building Fund and one $100 coupon bond in the Procter Monument Fund, all in the same series, were sold and not replaced $5000 of the amount secured for bonds in the Life Membership Fund was transferred to the Current Fund

' The treasurer is keeping a separate account of all investments for the Headquarters Building property and equipment The amount to April 30, 1934, was $487,682 94

' The chairman of the Council, the secretary and treasurer were appointed a Committee to consider the most appropriate means of using the Franklin M Apple Fund which amounts to $1607 05 and which is now held in the Current Fund The Committee recommends that this amount be applied to the purchase of the furniture for the Reading Room of the American Institute of Pharmacy and that an appropriate plate be displayed in the Room

"A further payment of 20% was made on the balances in the Baltimore Trust Company and it is expected that further payments will be made later In the mean time the unpaid balances draw interest at 2%

'The Committee is pleased to report that the property and funds of the ASSOCIATION are in a very satisfactory status considering the conditions and the Committee has no changes to recommend at this time "

On motion of Caspari—Christensen, the report was received and the recommendations approved

56 Committee on Publications Chairman DuMez submitted the following report

"Your Committee on Publications respectfully submits the following report on its activities during the past year, and on the status of the ASSOCIATION'S publications

"*Journal* The total expenditures for the publication of the JOURNAL for 1933, including the Editor's salary, were $18,212 94 ($13,212 94 plus $5000) The total expenditures for 1932 were $19 955 51 ($14 955 51 plus $5000), which represents a decrease of $1742 57

The receipts of the JOURNAL for advertising, subscriptions, sale of single copies, reprints etc , for 1933 were $7900 The subscription credit received from non-headquarters building members less 20% for overhead amounted to $4334 26, making a total of $12,234 26 The total receipts for 1932 were $13 580 34 The receipts therefore, decreased by $1346 08

The total expenditures of $18,212 94, less the receipts of $12,234 26, show the net cost of the JOURNAL for 1933 to be $5978 68 The net cost for 1932 was $6315 17 The net cost of the JOURNAL therefore decreased by $396 49 from that of the preceding year

The JOURNAL has not escaped being affected by the depression However, the showing made in the past year and nine months indicates that conditions are improving In 1932 the net cost of the JOURNAL was $1532 61 above that of the preceding year In 1933, on the other hand, the net cost was $436 49 below that of 1932 The receipts up to May 1st of this year are $3782 91, whereas they were only $2902 59 at the same time last year This represents a gain of $880 32 If the expenses can be kept down, a further reduction in the net cost of the JOURNAL may be looked for this year

Following established custom, the publishing companies were requested early last fall to submit estimates on the cost of publishing the JOURNAL for the coming year The Mack

Printing Company of Easton, Pa , submitted the lowest estimate, and was again awarded the contract

Further details relative to the management and publication of the JOURNAL will be reported by Editor Eberle

'*Year Book* Volume 20 of the YEAR BOOK of the ASSOCIATION which contains the report on the progress of pharmacy for the years 1931–32 should be in the hands of the members by this time Three thousand (3000) copies were ordered to be printed

"The printer was rather slow on the job The manuscript for the 1931 volume was placed in his hands last summer, and the manuscript for the 1932 report was furnished him in December

' Certain journals were again abstracted for the Committee of Revision of the United States Pharmacopœia, and these abstracts were included in the reports on the progress of pharmacy To cover the cost of this work the Board of Trustees of the Pharmacopœial Convention again appropriated the sum of $1000

The printing binding etc was done by the Lord Baltimore Press of Baltimore, Maryland

'Work was begun some time ago on the volume for 1933 Much of the abstracting has already been done and it is hoped that the book will be ready for distribution by the end of September

National Formulary V Up to March 1 1934 a total of 49,126 copies of the National Formulary V were printed Of these 48 626 were bound in buckram and 500 were bound in leather Of the copies bound in buckram 48 211 have been sold and 80 copies have been distributed gratis Of the copies bound in leather 100 have been sold and 12 have been distributed gratis This leaves on hand with the J B Lippincott Company a stock of 335 copies bound in buckram and 388 copies bound in leather The Mack Printing Company has approximately 450 copies of the N F V which are now being bound in buckram for delivery to the J B Lippincott Company

Permission was granted to Dr Macfarlan to use portions of the text of the National Formulary V, in the preparation of a formulary for the Philadelphia County Medical Society, and to Dr R P Walton of the School of Medicine of Tulane University for the reproduction of three formulas in a syllabus of prescription writing intended for the use of students

Pharmaceutical Recipe Book Up to March 1,1934, 5000 copies of the Recipe Book had been printed and bound in buckram Of this number 4803 copies have been sold and 95 complimentary copies have been distributed, leaving a stock on hand of 103 copies During the period June 1, 1933 to March 1 1934, 317 copies were sold whereas only 278 copies were sold in the preceding 12 months

"500 copies of the Recipe Book, Series B were ordered recently to replenish the rapidly diminishing stock on hand

' In conclusion, your Committee extends thanks to those who have cooperated in promoting the interest of the ASSOCIATION S publications and expresses its appreciation of the fine cooperative spirit shown by the many pharmaceutical journals of the country in giving publicity to the ASSOCIATION'S activities '

The report was received on motion of Christensen—Adams

57 Use of the Text of the N F V As recommended by the Committee on Publications permission to use without charge portions of the Text of the N F V for partial reproduction was granted to the Philadelphia County Medical Society in its proposed formulary and to the School of Medicine of Tulane University in a syllabus of prescription writing for medical students provided the usual acknowledgment be printed on the title page of these publications on motion of Adams—Christensen

58 Editor of the Year Book The following report was submitted by Editor DuMez

'Volume 21 of the YEAR BOOK covering the calendar years 1931 and 1932 has just been distributed The fact that the volume did not make its appearance earlier is disappointing The manuscript for the first half was given to the printer last summer and that for the second half was furnished him in December

Work is progressing satisfactorily on the preparation of the volume for 1933 All assignments have been made and a considerable amount of abstracting has already been done A spe-

cial effort is being made to push the work to completion before the end of the year so that the abstracts can be carried in the JOURNAL beginning with 1935 It will hardly be possible to carry more than the abstracts for one year in the JOURNAL, so that it will be necessary to prepare another volume of the YEAR BOOK covering the literature for 1934

"If the work of the 1933 volume is completed by September, let us say there will be a period of three months remaining before going on a monthly schedule This will be sufficient time to get a good start on the abstracting for 1934 and it seems that it should be possible to complete it by the end of 1935 in spite of the fact that the work will have to be done along with the abstracting of the current literature for monthly publication

"This year was not a good time to begin the preparation of abstracts for monthly publications in the JOURNAL, as it was expected that the offices of the ASSOCIATION would be moved from Baltimore to the new Headquarters Building in Washington, and that it would take some time to get settled in the new quarters The offices have been moved as expected, and the Editor of the JOURNAL is getting his affairs in such shape that there is no good reason why we should not begin the preparation of abstracts on a monthly schedule by the first of next year This will give ample time to organize a staff of abstractors and to arrange for supplying them with the publications to be abstracted each month '

On motion of Swain—Eberle, the report was received

59 Editor of the Journal Editor Eberle read the following report

'The report of the Editor herewith deals with the business of 1933 and as report of previous years, is compared with the prior year 1932

"The expenses of the JOURNAL for 1932 were $14,955 51, the receipts were $8861 37 Deducting the receipts not including membership subscriptions from expenses shows a net cost of $6094 14 Add the Editor s salary and we have a cost of $11 094 14 The credit on membership subscriptions, not Headquarters members less 20% for overhead, which for 1932 is $4718 97 from the gross cost, $11 094 14, leaves $6375 17 net cost including the Editor's salary an average of 4990 copies were printed monthly, making a cost of about $1 27 per volume

"The total expenditures for the publication of the JOURNAL, for 1933, including the Editor's salary, were $18,212 94 ($13 212 94 + $5000) The total expenditures for 1932 were $19,955 51 ($14 955 51 + $5000) which represents a decrease of $1742 57

'The receipts of the JOURNAL for advertising, subscriptions sales of single copies, reprints etc , for 1933 were $7900 The subscription credit received for non Headquarters building members, less 20% for overhead, amounted to $4334 26 making a total of $12,234 26 The total receipts for 1932 were $13 580 34 The receipts have therefore, decreased by $1346 08

The total expenditures of $18 212 94 less the receipts of $12,234 26 show the net cost of the JOURNAL for the year to be $5978 68 The net cost for 1932 was $6375 17 The net cost of the JOURNAL has, therefore decreased by $396 49 over the preceding year

' The number of pages in 1932 was 1362 in 1933, 1310 The publication costs in 1932, $10 261 45, in 1933, $9107 44 Mailing costs of the JOURNAL in 1932 $655 21, in 1933 $599 51, mailing back numbers of the JOURNAL for 1932, $13 93 in 1933 $26 50 Engravings and photographs, other than included in Mack Printing Company account in 1932 $479 97, in 1933, $387 06 Binding JOURNALS in 1932 $43 50 in 1933 $25 75, stationery and office supplies in 1932, $86 73, in 1933, $69 20, clerical, in 1932 $1419 in 1933 $1242 Commissions on advertising in 1932, $554 08, in 1933 $488 22 Small miscellaneous items make up the remainder of the total expenses

' Detailed comparative receipts 1932 and 1933 The receipts for 1932 $8861 37, for 1933, $7900 Advertising in 1932 brought $5931 47, in 1933, $5241 92 Subscriptions in 1932 amounted to $939 91 in 1933 $903 53 it should be understood that we make every effort possible to bring subscriptions to memberships Single copies in 1932, $51 30, in 1933, $28 51 Reprints, in 1932, brought $1098 14 in 1933, $1038 79 Miscellaneous items amounted to $840 55 in 1932, in 1933, $687 25 In 1932 the National Association of Boards of Pharmacy contributed $80, none in 1933 The American Association of Colleges of Pharmacy contributed $300 in 1932 and the same amount in 1933 In 1932, J U Lloyd contributed $50 toward the expense of printing his fourth paper on Physics in Pharmacy and we have received $50 from him for the publication of the paper presented at Toronto The Conference of Pharmaceutical Association

Secretaries contributed $25 in 1932 toward the expenses of printing their minutes in the JOURNAL and a like contribution was made in 1933 The Conference of Law Enforcement Officials contributed $75 A number of reproductions of pictures and books have been made without cost to the JOURNAL and ASSOCIATION and the sum derived from the sales of these was contributed to the JOURNAL— The Laboratory,' Dr Power in His Laboratory,' 'Ground Breaking at Head quarters,' Proof Sheets of United States Pharmacopœia I ' 'New Nomenclature,' which, with contributions toward the expenses of the JOURNAL amounted, in 1932, to $459 05, in 1933, $222 50

In recent years the papers presented to the Sections have increased in number and some in the pages of the reports, as a result we have about 25 papers unpublished several of these lengthy, and a large list has been contributed for this meeting If it had not been for the earlier meeting of the ASSOCIATION most of these papers would have been published

As stated in the last report, among the papers in recent years have been those presented in partial fulfilment of work for degrees As then stated, it has occurred to the Editor that part of the expenses for papers of that type should be met by the authors There are two sides to the question, of course Another expense that should, perhaps in part be met by authors is when a large number of cuts are used Tabular matter should be summarized to an extent The JOURNAL has carried the expense of having reprints made of reports and minutes of meetings in connection with the annual convention for distribution at the sessions of the ASSOCIATION and for pharmaceutical publications Also abstracts have been mimeographed for like distribution more than one hundred have been prepared

A work of interest and value has been published, The Professional Pharmacy—an Analysis of Prescription Department Activities' by Frank A Delgrado and Arthur Kimball It is part of the National Drug Store Survey and published under and by authority of the U S Department of Commerce Bureau of Foreign and Domestic Commerce About 5000 copies of reprints have been sold and the amount received has paid for making them, but not for publication costs Fine publicity has been given by most of the pharmaceutical publications

Papers relating to U S P and N F revision work have appeared in the JOURNAL and cooperation has been given to research work of the American Drug Manufacturers' Association and the American Pharmaceutical Manufacturers Association

The contribution of the American Association of Colleges of Pharmacy is appreciated and thanks are extended to Dean C B Jordan, editor of the department, for his coöperation

The difference between receipts and expenses up to April 1st of last year and April 1st of this year is only $10 less this year than last The favorable difference would have been greater, but the cost of the reprints of Professional Pharmacy increased the expenses, this shows up in the larger receipts up to May 1st of this year The receipts up to May 1st of 1933 were $2902 59 and up to May 1st of this year $3798 24

Itemized receipts and expenses are in the hands of the secretary and these are included in the auditor's report Scheduled itemized lists of the receipts and expenses for 1933 were included in the January report 1934, to all members of the Committee on Publications

The Editor is thankful for the fine cooperation given him "

The report was received on motion of Adams—Kelly

60 Committee on Standard Program In a verbal report, Chairman Hilton reviewed the work of the Committee in connection with this meeting and explained why it was not possible to submit the program to the Council earlier, as is customary as well as the changes made necessary by the dedication exercises The report was received

61 Committee on Recipe Book Chairman Lascoff read this report

Chairman J Leon Lascoff submitted the following report Secretary E F Kelly reported that up to June 1st of last year 4487 books were sold and 420 copies were in stock This year he reports that up to March 1, 1934 4897 books were sold and 103 remain in stock, also an additional 500 copies have been ordered All 5000 copies have been sold from Series A and 9 copies from the 500 ordered

On March 12 1934 your chairman received the following letter from Mr J H Gardner of Lippincott and Company the distributors

' Each day we have been receiving a number of inquiries concerning the PHARMACEUTICAL RECIPE BOOK and some of the prospective customers say that they saw an article in one of the Pharmaceutical Journals

'The writer would like to have a copy of this recommendation if you can arrange to send it to him

' This is excellent publicity and already has resulted in five or six definite sales "

During 1932–1933, definite work was begun on the revision of the Recipe Book Seven bulletins were mailed to the members of the Committee In these bulletins were included 102 new formulas and a table of doses

During 1933–1934, ten new bulletins were issued which brought up the complete total to 173 formulas and 72 additional formulas are now under consideration

The First Edition of the Recipe Book contained a total of 1621 formulas consisting of 777 Pharmaceutical Formulas 373 Hospital Formulas 34 Dental Formulas, 66 Diagnostic Reagents and Clinical Tests 28 Veterinary Formulas 45 Photographic Formulas 184 Cosmetic Formulas, 45 Flavoring Extracts 69 Technical and Miscellaneous Formulas

The proposed revision up to date includes 245 additional formulas consisting of 121 Pharmaceutical Formulas, 15 Hospital Formulas 59 Dental Formulas and Cosmetic Formulas, 16 Diagnostic Formulas, and 34 Technical Formulas

Dr H A Langenhan asks the following questions which are very helpful to members of the Committee in determining which formulas are suitable for adoption (1) Is any formula submitted to be included? (2) Have these formulas been tried out? (3) Is there a demand for them? (4) What points shall be considered in voting on them?

In answer to the first question it is necessary that at least a $/_3$ majority of the votes be in favor of the formula, before it is adopted

In answer to the second question I may state that before any of these formulas are included in the Recipe Book Second Edition each will be tried out as were those formulas in the First Edition

Answering the third question no formulas have been presented unless there have been requests for same

As to what points shall be considered in voting there are many to be observed As stated in the Preface of the First Edition The purpose of the Recipe Book is to supply definite formulas for those preparations, outside of the official books that are in fairly common demand in the retail pharmacy and the hospital pharmacy

Dr Langenhan also asks why the Recipe Book should be a *receptacle* for formulas not used" in the National Formulary (referring to the deletions) That question is answered by this fact After the new edition of the N F is out for a few years comparatively few pharmacists will be in possession of the N F V Quite a number do not have N F IV and very few have N F III

On many occasions, I have been asked for formulas from both of these books In further connection with the deletions from the Formulary, Dr Scoville writes that he is in favor of including all of the articles from Part I of the N F but none of those from Part II Your Chairman agrees with Dr Scoville and also suggests deleting the fluidextracts The galenicals of Part I are much more useful than the crude drugs of Part II

With the reports mailed to members and included in this report a sheet is included on which members can designate the deletions and inclusions they desire A list of deletions follows, only those not printed in September JOURNAL page 904, are given which see

On April 12, 1934 a letter was mailed to the members of the Committee informing them that the meeting of the members of the Recipe Book Committee would be held on May 9th at 12 30 P M Enclosed also were bulletins Nos 6 10 11, 12 14, 15, 16 and 17 The meeting had been called for the purpose of carefully considering the formulas already presented and to discuss their merits

A complete typewritten set of formulas, together with the names of the members voting has been compiled The result of their votes and comments have been assembled in a leather backed note-book of 200 pages

In the report of 1931–1932 at Toronto your chairman called attention to certain criticisms of the First Edition of the Recipe Book All will be taken into consideration and corrections will be made

Your chairman wishes to take this opportunity to express his personal thanks to the members of the Committee who have been so helpful with their criticisms and suggestions He also wishes to extend his appreciation to all the members of the AMERICAN PHARMACEUTICAL ASSOCIATION who have shown interest and who have cooperated in the work of revising the present edition of the Recipe Book Your chairman wishes to thank Secretary Kelly and Editor Eberle for their valued assistance

In conclusion I would like to state that with the number of formulas in the present Recipe Book, with their corrections, with the addition of approximately 250 new formulas with the new galenicals from the N F V which were deleted, the total number of formulas will be brought to approximately 2000

The A PH A Recipe Book, Second Edition together with the foregoing material will be the only Pharmaceutical Recipe Book of its kind It will prove of great value not only to the physician, the dentist, the pharmacist, the hospital pharmacy, but to the clinical laboratory, the cosmetician and to pharmaceutical manufacturers as well

On motion Adams—Eberle the report was received with the thanks of the Council for the splendid work of the chairman and his associates

62 Code for the Retail Drug Industry The president and secretary made a full report on the work of the ASSOCIATION in this connection the latter reporting as a member of the National Retail Drug Code Authority The subject was discussed at length by others present No action was required

63 Nomination of Honorary President Secretary and Treasurer Mr J K Lilly was nominated to the House of Delegates as Honorary President for 1934–1935 on motion of Swain—Caspari, E F Kelly as Secretary on motion of Swain—Adams and C W Holton as Treasurer, on motion of Eberle—Kelly

64 Annual Report of the Council to the House of Delegates Chairman Hilton and the secretary were authorized to prepare and submit the report on motion of Eberle—Adams

65 Election of Members On motion of Swain—Adams, the following applicants who were properly endorsed, were elected to membership

No 183, Morris Aaron Freedman, 52 Aborn St , Peabody Mass , No 184, Reginald D Dymond, 82 Dalhousie St , Brantford, Canada No 185 Robert A Timmel 14929 Tenth Ave , Whitestone, L I , N Y , No 186, William McKaba, 134 State St , Brooklyn, N Y , No 187, Seymour Stern, 991 President St , Brooklyn N Y No 188 Ada Johanna Bizzaeri, 324 E 116th St , Manhattan N Y , No 189 Herman J Steinberg, 2102 Bronx Pk N Y , No 190, Andor Hacker, 2474 Valentine Ave , Bronx, N Y , 191 Isidore Koenig 2963 W 23rd St Brooklyn N Y , No 192 S Alex Becker, 1699 Carroll St Brooklyn N Y , No 193, Nicholas V Arancio 423 E 80th St , New York, N Y , No 194 Herbert Bernstein, 1305—38th St , Brooklyn, N Y , No 195, Jack Zivin, 1321 Foster Ave Brooklyn N Y , No 196 Patrick Joseph Diskin, 2544 E 19th St , Brooklyn, N Y , No 197, Nicholas P Caridi 815 Woodward Ave , Ridgewood, N Y , No 198, Arthur J DeIanni, 354 E 119th St New York N Y No 199 Harry Wishinsky, 287 Henry St , New York N Y No 200, William Matz 1245 Harrod Ave New York, N Y , No 201, Armando Font, Jr , 46 Fort Washington Ave New York, N Y No 202, Harry Figatner, 173 Hooper Street Brooklyn, N Y No 203 Bernard Meyerson 214 Central Ave , Brooklyn, N Y , No 204 Libera Vasil Palmeri, 313—17th St Brooklyn N Y , No 205 Max Vogel, 82 E Park St , Long Beach N Y No 206, Joseph Brown Rogers New Albany, Mississippi, No 207 Edward Sacksman 632 Elizabeth Ave Elizabeth N J No 208, Eugene M Caskey, Box 696 Jacksonville, Texas, No 209 James Mitchell Chancy, 440 Washington St New York, N Y , No 210, John C Hood, Kinshan N C No 211 David Maistelman, 644 E 170 St , Bronx, N Y , No 212 Verne Willard Cowell 2911 M St , Lincoln Nebr , No 213, Otto Andreas Bjornstad, 396 West 4th St Spencer Iowa No 214 Thomas Meehan 2111–2115 E Susquehanna Ave Philadelphia, Pa , No 215 Albert C Fritz, 4101 E Michigan St , Indianapolis, Ind , No 216, Paul Buchanan Perrigo Allegan Mich No 217, C W Collins, 19th St and St Marys Ave , Parkersburg W Va No 218 W R Crane Fairmont, W Va , No 219, Jess A Reese, 2412 Grove Ave Richmond Va , No 220 Michael J Strassner, 24 Barbour St , Haledon, N J , No 221 Herbert Richard Hutchinson 65 Pillsbury Concord, N H , No 222, George R Arnold Box 471 Thermopolis, Wyoming No 223 Isidor Schnitter, 425 Washington St , Hoboken N J , No 224 John F Cosgrove 315 Ridge St Newark, N J , No 225, Samuel R Kleegon, 11363 N Martindale Detroit Mich No 226 Byron E Emery 370 Parnassus Ave , San Francisco, Calif No 227, Donald R Squier 14324 Jefferson St E , Detroit, Mich , No 228, Theo A Arneson, Montevideo Minn No 229 Buell Parker Bogan 1710 Douglas St , Sioux City, Iowa, No 230 Martin F Haberle 250 Langdon St , Madison Wis , No 231 Andrew Ruzeck 250 Langdon St , Madison Wis , No 232 Elizabeth Bohlson, 228 High St , Oshkosh, Wis , No 233, Stewart Irwin Lubcke Middleton Wis No 234 Lyman D Fonda, 600 Lafayette Ave Brooklyn N Y , No 235 Carl Hermann 21 W 6th Ave , Helena, Mont , No 236, Bernard Aaron 804 First Ave Elizabeth, N J No 237 Robb Vernon Rice, 510 McLeod Ave , Missoula Mont , No 238, Arthur Goldstein 720 W Main St North, Gainesville, Florida, No 239 Robert L White 25–27 Hernando St Gainesville Florida No 240, John F Mayer 1600 Shattuck Ave , Berkeley Calif , No 241, Victor C Piaskowski 7542 Michigan Ave , Detroit, Mich , No 242 Conda H Diehl 102 W Main St , Mechanicsburg Pa No 243, N Clark Clement, 61 Brook St , Wellesley, Mass No 244 Clemente A Tarallo, 93 Greenside Ave , White Plains N Y , No 245 Anthony John Zolenas Jr 1619 Spence St Baltimore, Md , No 246 Seymour B Dewey, 1148 Williams Rd , Cleveland Ohio No 247, Milton E Cohen, 100 Crooks Ave , Clifton N J , No 248 Camille Masucci 34 Ward Paterson, N J , No 249 Virginia Mae Powelson 171 Franklin Ave , Hasbrouck Hts N J No 250 Loreta Artese Paganelli, 288 Highland Ave Orange N J , No 251, Carson P Frailey 506–507 Albee Bldg , Washington D C , No 252, Dallas Ewing Billman 15—4th St , Paterson, N J , No 253, Louis M Roeg 428 Summit Ave , Westfield, N J

66 Election of Honorary Member Mr Charles Moore, chairman of the Commission of Fine Arts was elected an Honorary Member, on motion of Swain—Caspari

67 Honorary and Corresponding Members The secretary read a letter from Dr Edward Kremers containing several suggestions with respect to these classes of membership After a

general discussion, the Chairman and Secretary of the Council and the Editor of the JOURNAL were named as a special committee to make a study of the question and to report to the Council at the next annual meeting, on motion of Adams—Swain

The Third Meeting of the Council for 1933–1934 was held in the Shoreham Hotel on Thursday forenoon, May 10th, with the following members present Hilton Beal Dunning, LaWall Adams Fischelis DuMez Eberle and Kelly Sir Henry S Wellcome attended by invitation

The minutes of the Second Meeting were approved as read

68 Committee on Student Branches Chairman W Bruce Philip presented a verbal report On motion of Beal—Eberle the report was received and the recommendation approved that there be named a faculty advisor for each student branch or an advisor approved by the faculty

69 Food and Drug Legislation Dr Beal discussed the probable effect of S 2800 and other bills on the status of the U S P and N F A general discussion followed but no action was taken

70 Proposed Council on Pharmaceutical Practice By invitation Dr E Fullerton Cook presented a proposed plan for establishing such a Council under the auspices of the A PH A After a general consideration of the subject, the chairman was authorized on motion of Beal—Eberle to appoint a special committee for the Council to consider the proposal and to later report to the Council

71 Committee on Research The secretary read the following report as submitted by Chairman Arny

'Your committee conducted its business during the year by means of three Bulletins and held a meeting at Hotel Shoreham on May 9th with 8 of its members in attendance

'At this meeting, the following resolutions were passed

'*Resolved*, that the committee recommend to the Council and to the ASSOCIATION that the Research Grant for 1934–1935 ($1000) be awarded to W J Husa and his associates at the University of Florida for a continuance of their research on extraction

Resolved, that the committee recommend to the Publication Committee that the papers on extraction presented by Dr Husa at this 1934 meeting, embodying the results of work performed by him in 1932–1934, be published in the A PH A JOURNAL as promptly as possible The committee further suggests that if feasible a sum not to exceed $150 be drawn from the A PH A Research Fund to pay the cost of publication of these extraction papers'

After discussion the report was received and the recommendations approved on motion of Beal—Fischelis

72 Commission on Proprietary Medicines Chairman Beal verbally reported progress and suggested that the Commission might give study to the proposal to limit the preparation of medicines to registered pharmacists The report was received and the suggestion approved on motion of Dunning—Adams

The Fourth Meeting of the Council of 1933–1934 was held in the Shoreham Hotel on Friday evening, May 11, following the final General Session Chairman Hilton and Messrs Beal Dunning, Adams, Fischelis, Krantz Holton Eberle DuMez and Kelly were present

The minutes of the Third Meeting were read and approved

73 Committee on National Formulary The secretary submitted the following report for Chairman Gathercoal

'The National Formulary Revision Committee elected in 1929 at the Rapid City meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION is now in the fifth year of its activities

'The organization of the Committee by the election of its chairman and secretary was completed late in 1929 and the first page of the National Formulary 'Bulletin" was issued January 8, 1930 The first report of the chairman of the National Formulary Committee was presented to the Council early in May 1930 This first report dealt largely with certain suggestions regarding Scope and especially regarding a further development of interest in the National Formulary among physicians and among pharmacists Three specific features of this first report might be mentioned at this time, namely

(*a*) An active undertaking to determine the 'Extent of Use' of N F V preparations in hospital pharmacies large prescription pharmacies and ordinary drug stores and as manufactured by the leading pharmaceutical manufacturing houses

"(*b*) A definite request for research in connection with National Formulary preparations

(*c*) A leading intimation that the actual money expenditure in connection with the Revision should be markedly increased over what had been spent in previous Revisions, in fact, the sum of $40,000 was mentioned in this connection

' That the Council may have a fair idea of what has been accomplished along these three lines, permit me to present the following statement relative thereto

' (*a*) In reference to determining the Extent of Use' of drugs and medicines as a guide to the Committee regarding admissions to N F VI three great surveys have been executed, one on the use in pharmacies of N F V preparations, one on the use in pharmacies of unofficial preparations and one on prescription ingredients A fourth survey on the number of prescriptions annually compounded in the United States was initiated and successfully carried through in connection with other pharmaceutical organizations The total cost of these several surveys has never been completely separated from other N F expenses or accurately computed but certainly it is several thousands of dollars, possibly, counting the $500 donation from the U S P Board of Trustees and the great amount of material contributed by the National Drug Store Survey (St Louis), as much as $10 000

' (*b*) Regarding National Formulary research, while several small appropriations have been made from the A PH A Research Fund and while a considerable amount for research has gone through the N F General Expense Fund, yet your chairman has been definitely disappointed in the small amount of contributions that have been made toward research on important N F problems Most of the really important research contributions have come from private sources without any financial contributions from the A PH A and, in fact hardly an acknowledgment by the A PH A of this important work It would be but fair for me to say that the cost of research contributions made by the pharmaceutical manufacturing firms to the ampul monographs and to the tablet monographs of N F VI exceed by five times over the total monies appropriated by the AMERICAN PHARMACEUTICAL ASSOCIATION for research on N F VI monographs during the past four years However, the total volume of research on N F VI monographs has been surprisingly large and will be reflected in the revised work In this connection mention should be made of the very splendid contributions by Dr H W Youngken other Pharmacognosists, and certain Pharmacologists to the several new monographs on glandular products that will appear in N F VI

"(*c*) The cost of the present Revision of the National Formulary as compared with the cost of previous Revisions has, no doubt caused considerable astonishment and even alarm to officers of the AMERICAN PHARMACEUTICAL ASSOCIATION However this cost is still far below the estimate of $40,000 that was given you five years ago, and the total cost of the Revision probably will not be more than 25 per cent of the U S P Revision costs

' During the first year of revision work a meeting of the Committee was held near Cleveland, Ohio at which Rules of Business Procedure and General Principles of Revision were extensively discussed and adopted Tentative admissions of about 400 items were made and the complete organization of the Revision work was set up

' During the year 1931, marked activity prevailed in the nine Sub committees and a preliminary review of practically all of the admitted monographs was made A second meeting of the Committee was held at Pocono Manor Inn in June 1931 at which splendid data on the extent of use of N F V preparations and of unofficial preparations were presented Final action was taken on about 500 admissions to N F VI Important work was done in the Sub-committee meetings, and the number of pages of the N F Bulletin increased to 350, and of the Sub-committee Letters to about 400 pages by the end of 1931

' During 1932 the Sub committees reported extensively on their monograph work, and the number of pages of the Bulletin increased to about 650 No Committee meeting was held during this year, but a vast amount of work was given to the completion of the several surveys on the extent of use of medicines in the United States

' During 1933 a very large number of the monographs appeared in the Bulletin, and the number of pages of the Bulletin increased to about 1350 During this year also the Prescription Ingredient Survey' was published in book form By the end of the year at least 400 monographs out of about 700 were definitely reported out from Sub-committees and were ready for the Editorial Committee

"Since the first of 1934 many more monographs have been declared completed by the Sub committees, and the editorial work has been progressing rapidly At the present date all of the 110 monographs assigned to the Sub committee on Pharmacognosy have been completed, published in the Bulletin and have been practically completed from the editorial standpoint All of the 88 monographs assigned to the Sub committee on Chemistry have been completed and published in the Bulletin and have been largely finished from the editorial standpoint All of the 144 monographs assigned to the Sub committee on Extractive Preparations have been published in the Bulletin have been reviewed in 'First Proof' by Chairman Scoville and are practically ready for the printer There are possibly three or four of these monographs not yet finished This Sub committee has also prepared the proximate assays and these assay processes have been published and criticized and are ready for inclusion in the monographs All of the 27 ampul monographs have been published and republished in the Bulletin They have been very extensively criticized and many comments have been received recently as to the satisfactory appearance of these monographs Sub-committee No 3 on the Solution Preparations (elixirs solutions syrups, waters) has had perhaps the most difficult assignments of any in connection with the N F Revision There are still a considerable number of unfinished problems in this Sub committee though a vast amount of work has been done by the Sub committee Most of their monographs have been published in the N F Bulletin The other Sub committees have largely completed their assignments except the special Sub committee on Tablets This Sub-committee in charge of Professor Nichols has been assigned an enormous amount of work, and unfortunately was organized much later than the other Sub-committees However, we feel confident that during the coming summer this Sub committee will get most of its monographs into the Bulletin and in a very satisfactory form

In concluding this report, the Chairman of the N F Revision Committee will advance no particular suggestions or proposals We have no new projects in mind and our only aim now is to satisfactorily complete the work and get it into the printer's hand as rapidly as possible We look forward to the publication of the Revised Edition at as early a date as possible and really greatly desire to see the new U S P and the new N F made official July 1, 1935 Perhaps however this is an impossibility

' No budget or proposal of expenditures will be presented at this time It is expected that the general office expense and the Bulletin publication expense will be about the same during the next year as in the past year "

On motion of Kelly—Eberle the report was received with thanks to Chairman Gathercoal to the Committee on N F and to all who have coöperated with them in preparing the text of the N F VI

74 Headquarters Building Chairman Dunning referred to the splendid coöperation that Mr J O Shumate of the George A Fuller Company, has given in connection with the erection of the headquarters building and which should be suitably acknowledged On motion Dunning—Krantz, it was ordered that an appropriate certificate be prepared and delivered to Mr Shumate and that later he be given an honorarium of $100 from the Headquarters Building Fund

75 Election of Members The following applicants were elected to membership on motion of DuMez—Dunning

No 254 Jose Menendez Girogetti St , No 1 Rio Piedras Puerto Rico, No 255 Burton K Murdock 10 Main St , Kennebunk Maine No 256 Joseph P Maile 522 Ocean Ave Brooklyn N Y , No 257, Purcell Smith Country Club Station Little Rock Ark , No 258 R H Wagner, 3300 Garrison Blvd , Baltimore, Md , No 259, M B Wagner 400 W Baltimore St , Baltimore, Md , No 260 J Jephson, 15519 Waterloo Rd , Cleveland Ohio No 261, Joseph J Opatrny, 3789 E 131st St Cleveland Ohio, No 262, Bliss Clark Wilson, Letcher S Dak

The chairman declared that its work was completed and that the Council for 1934–1935 was adjourned

E F Kelly, *Secretary*

THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934–1935

Office of the Secretary 2215 Constitution Ave Washington D C

LETTER NO 1

May 11 1934

To the Members of the Council

The reorganization and First Meeting of the Council 1934–1935 was held in the Shoreham Hotel, Washington, D C on Friday, May 4 1934 beginning at 11 15 P M

1 The roll was called and the following were present Hilton Beal, Dunning Philip Adams, Fischelis, Geo D Beal Kelly, Eberle and DuMez

2 Election of Chairman S L Hilton was elected Chairman of the Council for 1934–1935 on motion of Dunning, seconded by Geo D Beal and carried

3 Election of Vice Chairman J H Beal was elected Vice Chairman of the Council for 1934–1935 on motion of Philip, seconded by Dunning, and carried

4 Election of Editor of the Journal E G Eberle was elected Editor of the JOURNAL for 1934–1935 on motion of Geo D Beal, seconded by Kelly and carried

5 Election of Editor of the Year Book A G DuMez was elected Editor of the YEAR BOOK for 1934–1935 on motion of Eberle, seconded by Philip and carried

6 Membership of the Council The membership and officers of the Council for 1934–1935 are as follows

ELECTED MEMBERS

J H Beal, Fort Walton, Fla (Term expires 1935)
C E Caspari, Euclid and Parkview Aves, St Louis, Mo (Term expires 1935)
C H LaWall, 214 S 12th St, Philadelphia, Pa (Term expires 1935)
H V Arny, 115 W 68th St, New York, N Y (Term expires 1936)
H C Christensen 130 N Wells St, Chicago, Ill (Term expires 1936)
W D Adams Forney, Texas (Term expires 1936)
H A B Dunning Charles and Chase Sts Baltimore, Md (Term expires 1937)
S L Hilton, 1033 Twenty Second St, N W, Washington, D C (Term expires 1937)
W Bruce Philip, Munsey Bldg Washington, D C (Term expires 1937)

EX OFFICIO MEMBERS

R P Fischelis, 28 W State Street, Trenton N J
Geo D Beal, Mellon Institute Oakland Station Pittsburgh, Pa
Oscar Rennebohm, 550 W Washington Ave Madison, Wis
E F Kelly, 2215 Constitution Ave, Washington D C
C W Holton, Box 81, Essex Fells N J
Rowland Jones Gettysburg, S Dak
E G Eberle, 2215 Constitution Ave, Washington, D C
A G DuMez Lombard and Greene Sts Baltimore, Md

OFFICERS OF THE COUNCIL

S L Hilton *Chairman*
James H Beal *Vice Chairman*
E F Kelly *Secretary*

7 Finance Committee Chairman Hilton appointed W Bruce Philip *Chairman*, C H LaWall and C W Holton as members of the Committee on Finance, and these appointments were confirmed on motion of Dunning, seconded by Fischelis and carried

8 Committee on Property and Funds The personnel of this Committee as provided for in the Council By Laws, is as follows for 1934–1935 R P Fischelis C W Holton S L Hilton W Bruce Philip and E F Kelly

9 Committee on Publications Chairman Hilton appointed H V Arny, C H LaWall and Walter D Adams as members of the Committee the other members being E G Eberle, E F Kelly, A G DuMez and C W Holton, as provided in the By Laws These appointments

were confirmed on motion of Philip seconded by Dunning Chairman Hilton appointed A G DuMez as *Chairman* of the Committee on Publications

10 Committee on Standard Program The chairman appointed S L Hilton, T J Bradley and E F Kelly as members of the Committee on Standard Program

11 Committee on Year Book The chairman appointed the following members Geo D Beal, *Chairman*, T W Nitardy, H W Youngken, E N Gathercoal, E E Swanson, J C Munch and J C Krantz Jr

12 Executive Committee of the Council It was moved by Philip that the chairman be authorized in case the occasion should arise to appoint an Executive Committee consisting of seven members The motion was seconded by Eberle and carried

13 Committee on Pharmaceutical Research On motion of Dunning seconded by Philip and carried W J Husa and Geo D Beal were elected members of this Committee to serve until 1939

14 Commission on Proprietary Medicines S C Henry was elected a member of this Commission to serve until 1939, on motion of Dunning, seconded by Philip and carried

15 Committee on Recipe Book After a general discussion it was moved by Fischelis that the Committee on Recipe Book be continued for one year The motion was seconded by Eberle and carried

16 Appointment of Standing and Special Committees and Delegates of the Association The president was authorized, on motion of Philip, seconded by Eberle and carried to make such appointments, as are now authorized, to fill vacancies as they may occur, and to make additional appointments as may be necessary or advisable during the year

17 Membership in and Work of the Association There was a lengthy consideration of these subjects with particular relation to the discussions of membership by the House of Delegates and the Conference of Pharmaceutical Association Secretaries No action was taken other than to authorize the secretary to withdraw from certain activities when and if this course becomes advisable and to confer with a committee representing the Conference of Pharmaceutical Association Secretaries

18 The Cost of the Headquarters Building Approach, Equipment and Grounds Chairman Dunning reviewed the information given in his reports covering the period since the property was purchased The cost of the building came within the contract price The widening of Constitution Avenue to eighty feet and of Twenty Second and Twenty Third Streets, made it necessary to revise the plans for grading and for the approach and for the planting and increased the cost of each of these items These additional costs amount to approximately $35 000 more than the collections to date, and it was necessary to incur them to satisfactorily meet the enlarged plans of the Government for the area adjoining our site Chairman Dunning recommended that pending further collections, the ASSOCIATION borrow this amount at 4% on a note which we will endorse and advised the Council that he had made arrangements for the temporary loan with the Maryland Trust Company of Baltimore After general discussion, it was moved by Dunning that the proper officers of the ASSOCIATION be authorized to complete the arrangements as outlined above, for a loan of $35 000 at 4% interest with the Maryland Trust Company on a note of the ASSOCIATION endorsed by Chairman Dunning and to be renewed as necessary until further collections will liquidate the loan The motion was seconded by Fischelis and carried

19 Consideration of Various Reports, Resolutions and Recommendations Referred to the Council The secretary advised that a number of such communications had been referred to the Council some of them involving appropriations On account of the lateness of the hour it was not thought advisable to act on them and they were referred for consideration either by letter or at a meeting of the Council to be called later

The meeting then adjourned

E F KELLY, *Secretary*

"A Method for the Preparation of Parenteral Dextrose Solutions," by Harvey A K Whitney—Abstract of Paper, Scientific Section, A PH A

A discussion of the preparation of sterile dextrose solution for hospital use It includes a description of the distilling apparatus glassware sterilization and accessory, as well as hydrogen ion concentration control of the finished solution

EDITORIAL NOTES

Because of association matter in this issue a number of items were omitted from this department

A CENTURY OF PROGRESS

The International Exposition—A Century of Progress—opened May 26th and closes November 1st Indications are that this year the exposition will be greater than last year, additional exhibits have been included and improvements have been made in some of the entertainment features The Pharmacy Exhibit will be continued

ABSTRACTS OF PHARMACOPŒIAL LITERATURE

Another "Abstract of Scientific Literature" dealing with pharmacopœial subjects appearing in publications of 1933 has been prepared under the direction of F W Nitardy by E R Squibb & Sons Copies of these abstracts have been sent out with the compliments of the Board of Trustees of the U S P convention This abstract is issued as a supplement to the series of the U S P Revision A very limited edition has been published and all copies have been distributed to the libraries of medical and pharmaceutical colleges and may be consulted there no extra copies are available This is a most valuable contribution and has been abstracted by the staff of the Brooklyn Plant Library Miss E Pickering, Director and published under the auspices of the U S P Board of Trustees The abstracts have been taken from more than three hundred different Journals in the fields of medicine pharmacy chemistry and biology and constitutes a distinct service for pharmacopœial revision and the service of libraries and research workers

LEGIBLE PRESCRIPTIONS

A news dispatch from Berlin states that sickfund officials have complained to the government about physicians writing prescriptions so illegibly that pharmacists have difficulty in reading them The government has issued a general order to physicians to improve their handwriting

The same condition but evidently not to the same extent is brought out in the National Drug Store Survey issued by the Department of Commerce Bureau of Foreign and Domestic Commerce 'The Professional Pharmacy' published by the AMERICAN PHARMACEUTICAL ASSOCIATION presents the findings of an intensive survey among the strictly professional type of retail pharmacies, a detailed analysis of operations methods etc —A detailed analysis of nearly 24 000 prescriptions from selected drug stores—shows the importance of the prescription department in the operation of a modern retail drug store

DONATIONS

Daughters of the late Charles E Dohme Mrs E C True and Mrs C W Holton have presented to the museum of the American Institute of Pharmacy a beautiful counter scale which was used by the retail firm of Sharp & Dohme prior to the establishment of the manufacturing establishment under that name

Mrs C W Richardson of Washington, D C has presented a stone mortar from Sothorn's drug store in Georgetown, also an ointment jar from John Paul Jones' brothers' drug store in Fredericksburg

Lawrence Williams, of Baltimore, presented a representative number of show globes from his large collection He also donated several scales and balances ointment jars and mortars all of which made an attractive display in the museum of the A PH A headquarters

The display, by Chairman E Fullerton Cook of pharmacopœias and of circulars acquainted the visitors with the methods of revision and the tremendous amount of work and careful study involved in U S P revision and attracted much attention

Pharmacist J Leon Lascoff's collection of foreign prescriptions and of methods for finishing them forms an interesting display Mrs Whelpley s large assortment of badges is an interesting study in color art and association history

An unusual gift was made by James H Beal at a general session in the presentation of a fine specimen of Bezoar to the ASSOCIATION Further mention will be made of this valuable gift in reporting the proceedings of the meeting Charles H LaWall gave an historical account of Bezoar stones

PERSONAL AND NEWS ITEMS

Under the title of "The Consummation of Our Hopes and Dreams,' the *Druggists' Circular* for May published a chronological story of the erection of the American Institute of Pharmacy It is a valuable historical record

Senator Royal S Copeland addressed the Joint Meeting of the American Association of Colleges of Pharmacy and the National Association of Boards of Pharmacy on Food and Drug Legislation during the A PH A convention

Prof Anton Hogstad, Jr, in speaking before Oklahoma Pharmaceutical Association, presented the following resolution which was adopted by the Association

Let it be resolved that the so called commercial pharmacy be designated by the title of drug and sundry merchandising, and that the so called professional pharmacy be designated by its proper title of pharmacy," the resolution says so that confusion will not exist in the minds of the members of allied professions and the laity as to the aims and purposes of pharmacy "

The office of the National Drug Clerk has been moved from their old location on S Dearborn St to the Civic Opera House at 20 N Wacker Drive

President Frank A Blair, of the Proprietary Association was given a testimonial dinner on May 23rd at the Waldorf Astoria New York City

Joseph W E Harrisson, Assistant Director of Research at Philadelphia College of Pharmacy and Science, has been reëlected President of the Philadelphia Institute of Consulting Chemists and Chemical Engineers

Former President A PH A, **Robert L Swain** delivered the address to the graduating class of the College of Pharmacy Columbia University, on May 24th He also will speak before the graduating class of Connecticut College of Pharmacy New Haven, on June 4th Classmates presented him with a silver flower bowl during the A PH A convention

Dean A G DuMez, dean of the School of Pharmacy, will be the guest speaker at the annual meeting of the Alumni Association School of Pharmacy, Rutgers University, Newark N J

The National Retail Drug Authority Washington, D C, has moved from the Tower Building to the National Press Building in Washington

L M Kantner has been appointed by Governor Albert C Ritchie to the Maryland Board of Pharmacy for a term of five years, beginning May 1934 He has been engaged in retail pharmacy ever since his graduation from the School of Pharmacy of the University of Maryland in 1909 He is a former president of the Maryland Pharmaceutical Association and the Baltimore Branch of the A PH A

JAPAN PHARMACISTS UNION

The 12th annual convention of the Japan Pharmacists' Union was held at Shimizu Building Nihonbashi ku Tokyo on February 16th and 17th

OBITUARY

HERMAN A METZ

Herman A Metz, member of the A PH A and internationally known in the chemical industry, died May 17th, in a New Rochelle hospital, aged sixty six years He was born in New York City and educated in the public schools He attended night classes in chemistry at Cooper Union and completed the course As a youth he went to work for a chemical importer, later Koechl & Co When the firm was incorporated in 1893 Mr Metz became vice president and treasurer and when Mr Koechl retired Mr Metz acquired his interest The business was later incorporated under the name of H A Metz & Co He also organized the General Dyestuffs Corporation and in 1930, he organized the Advance Solvents & Chemical Corporation

Mr Metz was active for some time in politics serving the city as Comptroller and as a Congressman from Brooklyn from 1913 to 1915 He was also a member of the Board of Education for several terms and active in various municipal affairs He is survived by his widow and four sons

JOHN BLOCKI

John Blocki Honorary President of the Illinois Pharmaceutical Association and member of the A PH A died May 10th, after a lingering illness, aged eighty nine years He was one of the founders with T N Jamieson and Wilhelm Bodemann, of the Chicago Veteran Druggists' Association, in 1898

John C Robinson, Dallas, Texas, engaged in the wholesale drug business and as manufacturers representative for about sixty years died April 25th at his home in Dallas Texas aged seventy five years He graduated from the Maryland College of Pharmacy in 1877 For a time he was in the employ of Wm H Brown & Bros in Baltimore and then joined the firm of Powers & Whiteman as traveling representative When this firm merged with Merck & Co he continued as representative He is survived by his widow and three sons Lewis W Robinson is southern representative of Merck & Co and Frank T District Sales Manager for the Monsanto Chemical Co

In the sketch of the April JOURNAL of the late Frank B Stephens it should have been stated that Mr Stephens was an alumnus of the Illinois College of Pharmacy, Class of 1887

The death of **Prof Herbert C Kassner,** of Columbia University College of Pharmacy, was announced May 17th a sketch of the deceased will appear in the June[1] issue of the JOURNAL His passing is a great loss to the ASSOCIATION and the institution which he served faithfully for a number of years and sympathy is expressed to the bereaved The writer asks pardon for referring here to an article by Mrs Kassner in 1931 on 'Pharmaceutical History Brought to Light by a Famous Misnamed Picture' and which had wide distribution, the picture adorns many pharmacies

Dr Jacob A Flexner, prominent as a physician and as a pharmacist died at the home of his son Dr M Flexner in Louisville, Ky April 13th aged 76 years He was an alumnus of Louisville College of Pharmacy and, later studied medicine becoming a leader in that profession

OFFICERS OF THE ILLINOIS PHARMACEUTICAL ASSOCIATION

The Illinois Pharmaceutical Association meeting in LaSalle, May 15th–17th was well attended It was decided to continue holding the state convention in May instead of June The following officers were elected *President* George V Haering Chicago *First Vice-President* H M Anderson Monmouth, *Second Vice President* L Brown Hamilton Galesburg *Third Vice President*, E J Merriman, Joliet *Treasurer* George Bennett Urbana, *Secretary* Wm B Day Chicago

JOINT MEETING, MARYLAND PHARMACEUTICAL ASSOCIATION AND DELAWARE PHARMACEUTICAL SOCIETY

A joint meeting of the Maryland Pharmaceutical Association and Delaware Pharmaceutical Society was held at Wilmington Among the papers discussed were The Prescription Department" by Frank L Black, Price Stabilization" by Robert W Rodman Considerable attention was paid to the latter subject

ARKANSAS DRUGGISTS ELECT SUCCESSOR TO EDGAR D OSLIN

At a joint meeting of the executive board of the Arkansas Pharmaceutical Association and the Arkansas State Board of Pharmacy on April 11th Ira Brite was elected secretary manager of the state association to fill the unexpired term of the late Edgar D Oslin, who died April 9th The 52nd Arkansas state convention will be held in Texarkana

NEBRASKA PHARMACEUTICAL ASSOCIATION

The 53rd annual convention of the Nebraska Pharmaceutical Association which closed May 9th at Omaha was well attended and much interest was shown in the discussions of every day problems Among the papers presented were Show Cards,' by Carl P Berrgren, Monte Powell represented the N A R D F S Bukey spoke on 'What Does It Cost to Produce a Cosmetic' Charles W Bauer discussed Food and Drug Laws and the Copeland-Tugwell Bill,' J E Griffin spoke on Helping the Doctor Help His Patients,' George W O'Malley discussed The Sales Tax," and M T Williamson 'The Retail Drug Code"

It was decided to hold the next annual convention in Lincoln during February while the Legislature is in session

The following officers were elected *President* Guy Butler, Lincoln, *First to Fifth Vice-Presidents*, H L Bellamy, Cambridge, T J Ryan Omaha C S Lincoln Lincoln, A O Gordon Merna, C H Saults Gordon Orel Jones, Oconto was elected *Treasurer* and J G McBride Lincoln, *Secretary*

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

The ninety-fourth meeting of the American Association for the Advancement of Science will be held in Berkeley, Calif, from June 18 to 23, 1934 This will be the fourth summer meeting of the association on the Pacific Coast previous meetings having been held at San Francisco in 1915, at Portland Ore in 1925 and at Pasadena in 1931 All these have been joint meetings with the Pacific Division This year the University of California and the Pacific Division of the association are co operating as hosts Sessions will be held for the most part in lecture halls of the University of California on the campus at Berkeley

COPELAND BILL DEBATED

The Food and Drugs bill by Senator Copeland was taken up in the Senate on May 16th and considered for about an hour and deferred to make way for legislation urgently desired by the Administration Senator Copeland said that he would use every honorable means to secure passage of the bill at this session The President is understood to favor the principle of the bill

NEW JERSEY CODE

Governor Harry Moore of New Jersey, signed the State code for retail druggists, which provides for a mark up of 15 per cent over the manufacturers wholesale list price to retailers or wholesalers in dozen lots or less The code will operate under a 60 day trial

The Governor addressed the final hearing on the code and urged retailers to cooperate in making the code effective President R P Fischelis contributed largely to the success by presenting statistical information in support of the code

PACKAGE MEDICINE CODE IS APPROVED

The Trade Practice Provisions of the Code of Package Medicine Manufacturers provides

Section 1 (*a*) A member of the industry shall sell his products commodities or articles to primary distributors on an open price basis that is fair to all with the same allowances terms and prices as to products, quantities or trade classifications

(*b*) The term "open prices,' as used in this section means a price list which is published by each member of the industry for the equal information of all primary distributors in the separate or the several classes of primary distributors and which state all the prevailing terms of sale for the separate or the several classes of primary distributors

(*c*) Compensation paid to a primary distributor by a member of the industry for co operative advertising, counter displays, window displays, salesmen's efforts or any other special sales activities shall be uniform according to kind and scope of services rendered, and not on a basis of discounts on quantity purchases

(*d*) Each member of the industry or his agent shall file his current price list with the code authority within thirty days after the approval of this code Each member of the industry shall file (by registered mail) any subsequent revisions of such price list with said code authority

(*e*) This section shall not apply to the sale of private brand products on contract by a manufacturer to the owner of such private brand, nor to the sale of products for export, nor to bids submitted to governmental units

Section 2 No member of the industry shall use advertising whether printed, radio display or of any other nature, which is inaccurate in any material particular or misrepresents merchandise (including its use, trade mark, grade quantity size origin material, content, preparation, credit terms values, policies or services) and no member of the industry shall use advertising and/or selling methods concerning curative or therapeutic effects which are false and fraudulent

Section 3 No member of the industry shall use advertising which refers inaccurately in any material particular to any competitor or his merchandise prices values, credit terms, policies or service

Section 4 No member of the industry shall give permit to be given or directly offer to give, anything of value for the purpose of influencing or rewarding the action of any employee agent or representative of an other in relation to the business of the employer of such employee the principal of such agent or the represented party without the knowledge of such employer principal or party This rule shall not be construed to prohibit the free and general distribution of articles commonly used for advertising except so far as such articles are actually used for commercial bribery as hereinabove defined

Section 5 The re packaging or transferring of any article from the container of the member of the industry into another container, and the offering of such re packaged item for sale with intent or capacity to deceive the purchaser is an unfair trade practice

Section 6 The unauthorized use of a copy, counterfeit or colorable imitation of the trade mark, label or identifying name or device of the product of another corporation, association firm or person which has the tendency and capacity to mislead purchasers or prospective purchasers is an unfair trade practice

Section 7 No member of the industry shall secretly offer or make any payment or allowance of a rebate refund commission credit unearned discount or excess allowance, whether in the form of money or otherwise for the purpose of influencing a sale nor shall a member secretly extend to any customer any special service or privilege not extended to all customers of the same class

SMUGGLING NARCOTICS INTO PRISON

Four defendants were convicted and two, Dewey C Doss and Joseph H Miro, were acquitted March 30th, on charges of conspiring to smuggle narcotics into the Atlanta Federal Penitentiary

AMERICAN PHARMACEUTICAL MANUFACTURERS' ASSOCIATION

The annual meeting of the American Pharmaceutical Manufacturers' Association will be held in Chatham on Cape Cod, during the week of June 25th The headquarters hotel is the Chatham Bars Inn

CHARLES RICE

A former U S P chairman

MERGER OF ALCOHOL AND REVENUE BUREAUS

The Bureau of Industrial Alcohol and the Bureau of Internal Revenue were merged May 10th The old alcohol bureau becomes the Alcohol Tax Unit of the Bureau of Internal Revenue, together with a large part of the alcoholic beverage unit of the Department of Justice

The unit will be headed by Arthur J Mellott as Deputy Commissioner of Internal Revenue, but until passage of the deficiency appropriation bill providing funds for this office Mr Mellott will serve as a special assistant to the Commissioner of Internal Revenue He will have two assistants, one in charge of permit work and the other in charge of enforcement The former has not yet been chosen, but the latter post has been filled by Capt William R Sayles U S N D S Bliss, who has been Commissioner of Industrial Alcohol during the past five months returns to his former position as Acting Deputy of Internal Revenue in charge of the miscellaneous tax unit

Commenting on the transfer the Secretary of the Treasury Henry Morganthau, Jr, declared that for the present, the existing regulations and machinery for control of nonbeverage alcohol would remain unchanged but that changes might be made later if there appeared to be loopholes for tax evasion The personnel of the alcohol control organization will remain the same From a report of the *Paint Oil and Drug Reporter*

PHARMACISTS AT THE TOMB OF THE UNKNOWN SOLDIER

Members of the AMERICAN PHARMACEUTICAL ASSOCIATION and ladies visited the Tomb of the Unknown Soldier during the recent convention Former president L L Walton, as representative, spoke in part as follows Representing President R P Fischelis and the members of the AMERICAN PHARMACEUTICAL ASSOCIATION, I have the honor of placing this wreath upon the tomb of one, an unknown soldier, who gave his life in the struggle of this nation to help make the world safe for democracy May his be the reward of the righteous and of all who give their lives for the benefit of their fellowmen

HERBERT CARL KASSNER

Dr Herbert Carl Kassner Associate Professor of Chemistry at the College of Pharmacy of Columbia University, died on Thursday, May 17, 1934, at his home, 22 Carlton Terrace, Stewart Manor, N Y He had been ill with pneumonia for two weeks

Dr Kassner was born in Jamaica, Queens on March 6, 1899 He received his early education in the public schools of Queens graduating from the Jamaica High School in January 1917 In the fall of the same year he entered the College of Pharmacy of Columbia University, receiving the degree of Pharmaceutical Chemist in the spring of 1920 In the spring of 1921 he was granted the degree of Bachelor of Science in Pharmacy and awarded the Plaut Fellowship, which provided for study at a foreign university or college Dr Kassner elected the University of London for his graduate work and in 1924 was awarded the degree of Doctor of Philosophy by that University, offering as his dissertation in partial fulfilment of the requirements for that degree a report on the histological study of the seeds of *Ipomœa hederacea* and other species of *Ipomœa*

Upon his return to the United States Dr Kassner was employed as research chemist with Messrs E R Squibb and Sons Later he was called to the Albany College of Pharmacy, serving for three years first as Assistant Professor and then as Associate Professor in Chemistry In July 1927 he became Associate Professor of Chemistry at the College of Pharmacy of Columbia University in which capacity he served until his death

Dr Kassner was one of the scientific editors of *The American Druggist* and a frequent contributor to the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION He was a member of the AMERICAN PHARMACEUTICAL ASSOCIATION, the American Chemical Society and a corresponding member of the British Pharmaceutical Conference He served for several years as secretary of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION

Dr Kassner is survived by his widow the former Elsie Woodward, his parents Mr and Mrs Arno C Kassner of Jamaica, a brother Arno W C Kassner of Jamaica and a sister, Mrs Mildred K Joseph of St Albans, Queens

Recent photograph of the American Institute of Pharmacy

C T GILBERT

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIII JUNE, 1934 No 6

C THURSTON GILBERT

C Thurston Gilbert, the retiring president of the National Association of Boards of Pharmacy, was born in Danbury, Conn , June 6, 1892 He received his early education in the public schools and after completing the high school course in his home city he engaged as apprentice in the Barnum Pharmacy of Danbury

In 1910 he matriculated at the Philadelphia College of Pharmacy and Science and graduated from that institution in 1913, earning the P D degree and was awarded the AMERICAN PHARMACEUTICAL ASSOCIATION membership prize offered by Dean LaWall, for high average in examinations during the course After graduation he was employed for a time in pharmacies of Ocean City and Atlantic City, N J He served in Base Hospital No 43 at Fort McPherson, Ga , and in a pharmacy of Atlanta, Ga

Returning to his former home in Connecticut he was appointed postmaster at Noroton Heights and in January of 1918 he purchased a Noroton pharmacy In 1925, Mr Gilbert was appointed a Commissioner of Pharmacy and received re-appointment in 1930, he has been president of the Connecticut Board and vice-president and chairman of District No 1, National Association Boards of Pharmacy He was delegate to the Pharmacopœial Convention of 1930 and is serving his second term as president of the Southwestern Druggists' Association of Connecticut His address as president of the National Association Boards of Pharmacy is printed in the May issue of the JOURNAL, page 457

In 1917 Mr Gilbert married Miss Maud Alice Porter of Atlanta, Ga They have one daughter

EDITORIAL

E G EBERLE, EDITOR 2215 Constitution Ave , WASHINGTON, D C

SYMBOL OF A TREND

THE *Washington Evening Star* of May 2nd, presented an editorial under above caption, of which the first paragraph is quoted

'The beautiful new home of the AMERICAN PHARMACEUTICAL ASSOCIATION Constitution Avenue at Twenty-Second Street, has a significance exceeding even the important scientific purposes to which it will be dedicated It represents a tide which is working in the affairs of men It is a symbol of a trend "

The *Star* indicates the message in the last paragraph of the same editorial

"The city founded by the Father of His Country and proud to bear his name, it seems clearly indicated is destined to be the Athens of the Western World, the heart of Western Civilization The trend is manifest "

Many applications can be made of the thought on pharmaceutical trends Probably, never in the history of the AMERICAN PHARMACEUTICAL ASSOCIATION was there such evidence of strong desire to firmly establish professional pharmacy so that it may serve fully its purpose in rendering public health service, to work cooperatively with the professions engaged in the interest of public health The aims and purposes of the American Institute of Health, so ably expressed by Chairman H A B Dunning, evidence the strong desire and determination to move pharmacy upward and forward

President R L Swain in his closing dedicatory remarks, retrospects and looks forward in the closing words

"As we become aware of the vastness of this project, as our hearts begin to beat in harmony with its great ideals, as we catch a glimpse of the immensity of the principles for which it stands, let us, too, become dedicated to the great tasks remaining before us Let us resolve that this edifice shall really be our image Let us be determined to be worthy of it May we never foreget that the American Institute of Pharmacy is dedicated to those who have contributed their knowledge and endeavor to the preservation of public health and to the further advancement of science in pharmacy "

Chairman P H Costello said in substance that we must be guided by past experience in order to make it possible for us to render a greater service in the future

There are differences of opinion relative to the codes, opposite views, and there are evidences that these sometimes find expression in prejudiced opinions Few, if any, comprehend the full significance of the new deal, in some cases it can be shown that it is detrimental and has not improved conditions President R L Swain said in his annual address that "the NRA program, the whole code effort, as imperfect and contradictory as it undoubtedly is, is simply the first manifestation of forces seriously devoted to the task of creating a new economic system which will be more responsive to the social impulse Much of what is being done is highly controversial "

A view relative to the trend is referred to by him in these words

"I am certain that in due course, and time must be given to working out any fundamental concept, the general principles recognized in the codes will be shown to be advantageous to all branches of industry and society"

President L D Havenhill may have pointed to a trend in pharmaceutical education when he closed his address in saying that the modern intellectual development of any young man or woman falls quite naturally into two main divisions *first*, a non-technical, non-professional, so-called cultural part, and *second*, a technical or purely professional part After discussing the subject he concludes that "a program of this sort is in line with practices in other professions, and the sooner we enter their company and adopt their point of view the sooner we shall enter into our professional birthright and take our proper place with the professions of medicine and dentistry in helping solve the great problems of health and disease which are so very fundamental and important to our age in civilization"

We are not so much encouraged by conditions as they exist as by the trend toward developing opportunities and the evidence of greater interest in professional pharmacy

THE PROPOSED NATIONAL PHARMACY COUNCIL

"Let Us Raise a Standard to Which the Wise and Honest Can Repair The Event Is in the Hands of God"*

IN the proceedings of the Washington meeting, printed in this issue of the JOURNAL, will be found the outline of a suggestion made at the Second General Session of the ASSOCIATION, when an invitation was given to present new plans for the American Institute of Pharmacy In response to this proposal there seemed to be a feeling that it presented a great opportunity for American Pharmacy

A study of the tentative plan reveals that registration becomes a voluntary step, open to every trained pharmacist Registration will insure an immediate recognition for high professional standing This is the encouragement and support for which hundreds of pharmacists, who have remained true to the ideals and the standards of the profession, have been waiting

While the standards for pharmaceutical service must be established and maintained at a high plane of efficiency, nothing that seems impossible or impracticable is proposed The details, so far as tentatively drafted, embody only those features which most pharmacists are now claiming as their right and as their present objective—a properly trained pharmacist in charge, adequate medical stocks satisfactorily maintained, a suitable professional and a true professional and ethical policy is the entire story But its compliance must be real

The cost would not be prohibitive No matter how small or how large the organization the establishment of such a professional department would be possible Being truly professional, however, in its basic principles it would of necessity be established only upon the personal integrity of the pharmacist in charge so that the standing and registration of a pharmacy would have to be based upon the application of an individual It is for American pharmacy to study this opportunity

"After a general consideration by the Council the Chairman of the Council was authorized to appoint a special committee to consider the proposal and, later, to report to the Council" The committee appointed is composed of the following members E N Gathercoal, Robert L Swain, H V Arny, Edward Spease, Rober R Gaw, C F Kelly, R P Fischelis, C B Jordan and C Fullerton Cook *Chairman*

* George Washington Constitution Convention—1787

SCIENTIFIC SECTION

THE PREPARATION AND GERMICIDAL PROPERTIES OF SOME ALKYL DERIVATIVES OF HYDROXY DIPHENYLS *

BY S E HARRIS AND W G CHRISTIANSEN

The effect of an alkyl side chain on the bactericidal properties of phenols and other compounds has been the subject of several studies in recent years (1) It appears to be definitely established that the effect of a normal alkyl side chain is to augment greatly the bactericidal value of a phenol The typhoid activity increases with the size of the alkyl group until a maximum is reached beyond which further increase in the size of the alkyl group results in progressively lowered activity, a maximum has not been found in tests on staphylococcus aureus, *i e*, each increase in the size of the alkyl group has been accompanied by a greater activity

The present study covers the preparation and evaluation of a number of alkylated mono- and dihydroxy diphenyls It was expected that the alkyl groups producing the greatest activity would be smaller than the groups present in the most active alkyl phenols, cresols and resorcinols, due to the presence of the additional phenyl nucleus, and it was thought probable that the *n*-propyl side chain would be most effective This expectation was confirmed in the case of the 5-*n*-alkyl 2 hydroxy diphenyls, thus, the *staphylococcus aureus* activity of 2-hydroxy diphenyl is much greater than that of any other member of the series For the germicidal tests the compounds were dissolved in a solvent consisting of alcohol (25 cc), glycerin (35 cc) and water (*q s* 100 cc),[1] unless otherwise stated, the initial solution contained 0 25% of germicide These solutions were diluted with water as necessary immediately prior to test The results of these tests are contained in the following table

TABLE I

	Dilution at Which Bacteria Are Killed in 5 Minutes	
	Typhoid	Staphylococcus
A 5 *n*-Alkyl 2-Hydroxy Diphenyls		
2 hydroxy diphenyl	1–2000	1–800
5 ethyl 2-hydroxy diphenyl	1600	4000
5 *n* propyl 2 hydroxy diphenyl	400 400	12000 20000
5 *n* butyl 2 hydroxy diphenyl	400	2000
5 *n* amyl 2-hydroxy diphenyl	400	1200
B 3 *n*-Alkyl 2-Hydroxy Diphenyls		
2-hydroxy diphenyl	1–2000	1–800
3 *n* propyl 2 hydroxy diphenyl	400	400
3 *n*-butyl 2 hydroxy diphenyl	400	400
3 *n* amyl 2 hydroxy diphenyl	400	400

* Scientific Section A PH A, Madison meeting 1933

[1] This liquid is not in itself germicidal

C Alkyl 3 Hydroxy Diphenyls		
3 hydroxy diphenyl	1–800	1–4000
4 *n* propyl 3 hydroxy diphenyl*	1000	3000
6 *n* propyl 3 hydroxy diphenyl*	1000	<1000
D Alkyl Dihydroxy Diphenyls		
2,5 dihydroxy diphenyl[1]	1–500	1–500
4 *n* propyl 2,5 dihydroxy diphenyl*	<1000	10000
3 4 dihydroxy diphenyl	2000	1200
5 *n* propyl 3,4-dihydroxy diphenyl[2]	2000	4000

* Initial concentration 1–1000

[1] Initial concentration 1–250

[2] Initial concentration 1–2000

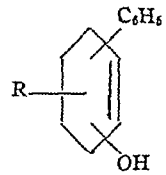
These results show

(*a*) Alkylation of 2-hydroxy diphenyl in the 3- or 5-position decreases the typhoid activity

(*b*) Alkylation of 2-hydroxy diphenyl in the 3-position decreases the *staphylococcus aureus* activity whereas alkylation in the 5-position increases it

(*c*) In the 5-alkyl 2-hydroxy diphenyl series the maximum staphylococcus activity is obtained with the *n*-propyl compound

(*d*) Propylation of 3-hydroxy diphenyl has little effect on the typhoid activity but decreases the staphylococcus activity The 6-*n*-propyl 3-hydroxy diphenyl in which the propyl group is para to the hydroxyl group is definitely less active than the 4-*n*-propyl isomer in which the alkyl and hydroxyl groups are ortho to each other This result is the opposite of that found in the 2-hydroxy diphenyl series, in the latter the compound containing the propyl group para to the hydroxyl group is definitely more active than the ortho isomer The activity of an alkyl hydroxy diphenyl is therefore dependent upon the relative positions of the alkyl, hydroxyl and phenyl nuclei



(*e*) Propylation of 2,5- and 3,4-dihydroxy diphenyls has little effect on the typhoid activity but does increase the staphylococcus activity

The initial concentration of the germicide in the alcohol glycerin water solution affects the results of the germicidal test at least in the case of 5-*n*-propyl 2-hydroxy diphenyl (Table II)

TABLE II

Initial Concentration of 5 *n* Propyl 2 Hydroxy Diphenyl	Dilution at Which Bacteria Are Killed in 5 Minutes Typhoid	Staphylococcus
0 25%	1–400	1–12000
	1–400	1–20000
0 10%	1–1000	1–30000
	1–1000	1–20000

The solubility of propylhydroxy diphenyl in water is low and the difference between the germicidal results obtained with 0 25% and 0 1% solutions may be due

to the fact that the larger ratio of alcohol to germicide in the latter case permits greater dilution without throwing the germicide out of true solution Thus, when 25% alcohol solutions containing 0 25 and 0 1% germicide are diluted so that the concentration of germicide is 1–30,000 (0 0033%) the alcohol concentrations would be 0 33% (with the 0 25% solution) and 0 83% (with the 0 1% solution) The results given in Table I were obtained mainly with 0 25% solutions, a similar series of tests made with 0 1% solutions might give higher activities for some of the compounds These additional tests would make the work more complete but it is doubtful whether they would alter the conclusions drawn from the data now available

The presence of sodium hydroxide affects the activity of these phenols, Table III contains a comparison of the results obtained in the absence and presence of alkali The alkaline solutions contained 0 25% germicide, 10–30% alcohol[1] and sufficient NaOH to yield a clear solution, this varied from 3 8 to 4 6 moles

TABLE III

	Dilution at Which Bacteria Are Killed in 5 Minutes			
	Without NaOH		With NaOH in Original Solution	
	Typhoid	Staphylococcus	Typhoid	Staphylococcus
2 hydroxy diphenyl	1–2000	1–800	1–2000	1–400
5 ethyl 2 hydroxy diphenyl	1–1600	1–4000	1–2800	<1–400
5 *n* propyl 2 hydroxy diphenyl	1–400	1–12000	1–2800	<1–400
5 *n* butyl 2 hydroxy diphenyl	1–400	1–2000	1–2000	1–10000
5 *n* amyl 2 hydroxy diphenyl	1–400	1–1200	1–400	1–2000

The addition of alkali

(*a*) Decreases the staphylococcus activity of the lower members of the series
(*b*) Increases the staphylococcus activity of the high members of the series
(*c*) Increases the typhoid activity of the lower members of the series
(*d*) Does not increase the typhoid activity of the highest member of the series

Although these phenolic substances are more readily soluble as the sodium salts, at high dilution these salts frequently hydrolyze to such an extent that the free phenol may begin to crystallize out Then, too, it is probable that the acidic nature of the phenol diminishes as the size of the alkyl group increases, for it is known that introduction of certain groups into phenols may depress the acidity to such an extent that the compound will not form salts, and becomes insoluble in aqueous alkali

Thus it is conceivable that the Gm -negative typhoid bacillus is attacked more readily by the sodium salt of the phenol, and that increased action ceases when the substituted phenol is not materially converted to the salt In similar manner the Gm -positive organism staphylococcus appears to be much less vigorously attacked by the sodium salt than by the free phenol The reversal of relative activity here occurs earlier in the series of progressively heavier substituents, and is much more pronounced

EXPERIMENTAL

During the early part of the study the 5 alkyl derivatives were synthesized by condensing the appropriate acid chloride or anhydride with 2 methoxy diphenyl by the Friedel and Craft

[1] Ten per cent in the cases of the ethyl and propyl compounds, 20% in that of the butyl and 30% in that of the amyl

method The resulting ketones were reduced by the method of Clemmenson and subsequently demethylated Considerable losses were experienced during the demethylation and this led to the adoption of an alternative method with notably smoother results This consisted of rearrangement of fatty acid esters of 2 hydroxy diphenyl by means of aluminum chloride to a mixture of 3- and 5 acyl 2 hydroxy diphenyls These ketones were separated and reduced to the corresponding alkyl compounds as before no demethylation being required

The esters were prepared by the action of the fatty acid on 2-hydroxy diphenyl in the presence of $POCl_3$ at 135° C Excellent yields were obtained of viscous colorless liquids which we were not able to obtain in crystalline form, an exception to this was the acetate which was obtained as white needles from dilute alcohol, m p 64° C In spite of repeated fractionation or cooling to low temperatures, no other ester would crystallize

The rearrangement of the esters was accomplished by heating to 160° C with anhydrous aluminum chloride for half an hour This gave the aluminum chloride compound of the mixed ketones in the form of a hard glassy mass which was decomposed in the usual way with dilute HCl The separation was conveniently brought about by extracting the mixture with petroleum ether in which the 3 acyl compounds were readily soluble The insoluble 5 acyl compounds which gave no red color with $FeCl_3$ were filtered off and recrystallized from a mixture of ether or benzol and petroleum ether The 3 acyl compounds were obtained by evaporating the solvent and distilling the residue These gave a deep red color with $FeCl_3$

It was observed that the length of the side chain had a marked effect on the products of rearrangement, the 5 acyl compound being the predominant product with shorter chains and a larger proportion of the 3 acyl compound being obtained when the *n* butyric and *n* valeric esters were rearranged

In spite of carefully standardized conditions, very variable yields of the alkyl derivatives were obtained on reducing these ketones The lost material was always encountered as a resin-like distillation residue from which all attempts to isolate crystalline products failed It is conceivable that these compounds are condensation products of the pinacone type A single detailed example of each typical reaction is given

2 HYDROXY DIPHENYL PROPIONATE (2 PHENYL-PHENYLPROPIONATE)

One mol of 2 hydroxy diphenyl was dissolved in one mol of propionic acid and the mixture heated to 135° C under reflux with mechanical agitation 0 5 mol $POCl_3$(or PCl_3) was then added slowly and the mixture maintained at 135° C till HCl was no longer evolved The ester was then decanted from the phosphorous acid, washed with water and dissolved in ether After being dried over $CaCl_2$, the ether was evaporated and the residue distilled, b p , 151–152° C at 4 mm Yield, 90%

REARRANGEMENT OF 2 HYDROXY DIPHENYL PROPIONATE

1 1 mols of powdered anhydrous aluminum chloride were added in small portions to one mol of 2 hydroxy diphenyl propionate Considerable heat developed and HCl was evolved The mixture was then heated in an oil bath at 160° C for 30–45 minutes The glassy reaction product was cooled, powdered and decomposed by adding gradually to well stirred 5% HCl The decomposition was completed by warming on the steam bath for a short time The mixture of 3- and 5 propionyl 2 hydroxy diphenyl was filtered off washed with dilute HCl and water and dried The dried product was extracted with a large volume of boiling petroleum ether b p 40–60° C and the undissolved 5 propionyl 2 hydroxy diphenyl filtered off After recrystallization from a mixture of ether and petroleum ether, 5 propionyl 2 hydroxy diphenyl was obtained as a white powder m p 151–152° C (2)

The petroleum ether extract was evaporated and the residue distilled yielding 3 propionyl 2 hydroxy diphenyl, b p 183–185° C /3 5 mm

5 *n* PROPYL 2 HYDROXY DIPHENYL

One part by weight of 5 propionyl 2 hydroxy diphenyl was refluxed during 10–12 hours with 4 parts amalgamated mossy zinc and 15 parts 20% HCl Brisk mechanical agitation during the reduction greatly reduced the time necessary for complete reduction The oily product formed was separated from the acid liquor and washed with hot water After drying with anhydrous

Na_2SO_4 in ether solution the ether was removed and the residue distilled, b p 171–172° C /9 mm, yield, 90%

[1] By demethylation of 2 methoxy 5 ethyl diphenyl

5 ACETYL 2 METHOXY DIPHENYL (3)

78 Gm (2 mols) 2 methoxy diphenyl were dissolved in 150 cc dry carbon disulphide and 112 Gm anhydrous aluminum chloride were added slowly with external cooling The mixture was well stirred and refluxed gently on the water bath while 31 Gm acetic anhydride (2 mols) were added during about one hour The refluxing and stirring was continued for a further period of one hour and the carbon disulphide distilled off The residue was decomposed with ice and HCl and the ketone extracted with ether The extract was washed with water, dilute NaOH and again with water, and then dried with $CaCl_2$ After distilling off the ether, the residue was distilled b p 194–204° C /6 mm The reddish distillate solidified on cooling and after recrystallization from petroleum ether had a melting point of 90–90 5° C , yield, 46%

ALKYL 3 HYDROXY DIPHENYLS

(*a*) *4 n Propyl 3 Hydroxy Diphenyl*—This was prepared by the rearrangement of 3 phenyl phenyl propionate and reductions of the resulting ketone as described under the preparation of 5 alkyl 2 hydroxy diphenyls The intermediate ketone gave a deep red color with ferric chloride solution and was therefore assumed to be the 4 acyl derivative The introduction of the acyl group into the 2 position is considered unlikely, owing to the steric hindrance of the phenyl group

(*b*) *6 n Propyl 3 Hydroxy Diphenyl*—Since the entire product of the ester rearrangement was the 4-acyl compound, the preparation of the 6 acyl 3 hydroxy diphenyl was necessarily carried out by the Friedel and Craft method on 3 methoxy diphenyl The reaction conditions for the acylation of 3 methoxy diphenyl were exactly those described under 5 acetyl 2 methoxy diphenyl and reference (3) The resulting ketone, which gave no color with ferric chloride was reduced in the manner previously described for 5 *n* propyl 2 hydroxy diphenyl

On attempting to demethylate the 6-*n* propyl 3 methoxy diphenyl by heating with hydriodic acid in glacial acetic acid much decomposition took place only a small quantity of the desired 3 hydroxy 6 *n* propyl diphenyl being obtained

DIHYDROXY DIPHENYL DERIVATIVES

The rearrangement of mono propionic esters of 3,4 dihydroxy diphenyl and 2,5 dihydroxy diphenyl gave tarry products from which no definite compounds could be isolated Direct introduction of acyl groups into the dimethyl ethers gave very poor yields, most of the ethers being recovered unchanged In the case of 3,4 dimethoxy diphenyl a 10% yield of 5 propionyl 3,4 dimethoxy diphenyl was obtained while in the case of 2 5-dimethoxy diphenyl demethylation took place at the same time, giving a 15% yield of 6 propionyl 2,5 dihydroxy diphenyl Various reaction-conditions were tried with little success The above results were obtained when the methods described in reference (3) were followed Both of the dihydroxy propionyl diphenyls gave a deep red color with $FeCl_3$

The biological tests on compounds reported herein were made in the Biological Research Laboratories of E R Squibb & Sons and we gratefully acknowledge their assistance

SUMMARY

A number of 3-alkyl and 5 alkyl 2-hydroxy diphenyls and propyl derivatives of 3-hydroxy diphenyl and of two dihydroxy diphenyls have been prepared and tested for germicidal activity The 5-alkyl 2-hydroxy diphenyls were obtained by (*a*) the Friedel and Craft reaction on 2-methoxy diphenyl, and (*b*) rearrangement of the fatty acid ester of 2-hydroxy diphenyl The rearrangement method gave the 3 alkyl compounds as by-products

Bactericidal tests showed that the 3-alkyl compounds are comparatively inactive and that the 5-alkyl compounds have a markedly specific activity, the potency against *Staphylococcus aureus* being high compared with that against *B Typhosus* Of the 5-alkyl 2-hydroxy diphenyls, the 5-*n*-propyl was by far the most active

ISOMERIC NITRO-CRESOLS *

BY LEROY W CLEMENCE AND GEORGE W RAIZISS

In the preparation of a series of mercurials, it was necessary first to obtain the ten isomeric nitro-cresols Most of the research on these compounds is found in the earlier literature, very little having been done in recent years The methods vary and are in many cases indefinite and the results obtained by their use do not always lead to the conclusions described, either in yield or quality of the material

We believe that a condensed comparison of the known methods coupled with a reference to the preparation of each isomer in the best obtainable yields and purity would be of service to the organic chemist In those cases where we have improved the methods, a detailed description of the compound is given We present, moreover, methods which involve the least expense in starting material and complication in process

The nitro-cresols are prepared either by direct nitration of the cresol, resulting in single derivatives or mixtures, or by diazotization and subsequent replacement of the corresponding nitro-toluidine The nitro-toluidines are prepared by direct nitration of the toluidines In a few instances the nitro-cresols can also be prepared by simultaneous diazotization and nitration of the toluidines The 5-nitro 2 hydroxy-toluene is also prepared by oxidation of the 5-nitroso derivative

However, in the case of two isomers, the 6-nitro-2-hydroxy-toluene and 5 nitro-3-hydroxy-toluene, it is unavoidable to employ roundabout procedures inas much as the nitro group cannot be introduced, in the desired position, directly into the nucleus either of the cresol or the corresponding toluidine In fact, we have as yet been unsuccessful in isolating any definite quantity of the former according to the described methods, but we are still working on what may prove a successful attempt

DISCUSSION AND EXPERIMENTAL PART—NITRO ORTHO CRESOLS

3-Nitro-2-Hydroxy 1-Methyl-Benzene—This was prepared by Wohl (1) using a mixture of meta nitro toluene and powdered alkali, keeping the temperature below 40° C The material had to be mixed thoroughly for 24 hours and the unchanged nitro toluene, of which there was a considerable quantity, separated from the sodium salt of the nitro cresol

Noelting and Wild (2) diazotized ortho toluidine in dilute H_2SO_4 and after adding dilute HNO_3 heated the mixture until no further evolution of nitrogen took place The nitro-cresol was

* Scientific Section, A PH A, Madison meeting, 1933

separated by steam distillation Denınger (3) similarly used a large excess of sodium nitrite and omitted the nitric acid The yields in either case were poor

Nitration of *o*-cresol in presence of acetic acid was tried by Hofman and Miller (4), Rapp (5), Hirsch (6) and Gibson (7) In this way a better yield of the 3 nitro compound is obtained but it is contaminated with the 5 nitro and 3-5 dinitro compounds They can be separated by steam distillation The 5 nitro derivative is non volatile with steam We have observed that the 3 nitro-cresol distils over almost entirely, and after an interval is followed by the dinitro compound, which is also much lighter in color and a finer crystal than the mono nitro derivative

The method which gives the best yield of the 3-nitro-2-hydroxy methyl-benzene without much contamination of the di-nitro compound is that of Schultz (8), using benzene as a medium Although he also claims a large yield of the 5-nitro-2-hydroxy methyl benzene, we were able to obtain only about 5% of this compound However, by using a lower temperature (0° to 5°) we increased the yield of the 3-nitro isomer to 31%

4 Nitro 2-Hydroxy-1-Methyl-Benzene—This was first prepared by Noelting and Collin (9) by diazotization of the corresponding nitro toluidine in dilute H_2SO_4 and then allowing the mixture to stand, finally warming on a steam-bath to complete evolution of nitrogen The above authors obtained a good yield of a material which melted at 106–108° Later it was proven by Witt, Noelting and Grandmougin (10) that the above reaction does not take place entirely in the direction desired, but that a large amount of material shown to be 6 nitro indazole is also formed They and others (11) attempted to separate the nitro indazole by fractional crystallization and also by use of its insolubility in Na_2CO_3 solution This of course reduced the yield of the nitro-cresol

Ullman and Fitzenkam (12) devised a method which gave practically no nitro indazole and a good yield of nitro-cresol They added the diazo solutions slowly to boiling dilute sulphuric acid and separated the nitro-cresol on cooling We have obtained yields as high as 85% with this method

Ortho toluidine is dissolved in 10 volumes of concentrated H_2SO_4 and nitrated with an equivalent of concentrated HNO_3 at 0° C The mixture is poured into ice and water and the nitro toluidine sulphate is filtered off This is dissolved in water and Na_2CO_3 added until neutral and the 4-nitro 2 amino methyl benzene filtered off, washed and recrystallized from alcohol M p —107° Yield = 90%

40 Gm of this nitro toluidine are dissolved in 600 cc of 10% H_2SO_4, warming to dissolve On cooling to 0° some crystals of sulphate separate Add slowly, with good stirring, a solution of 18 Gm of sodium nitrite in 50 cc H_2O, keeping the temperature at 0° Stir for 15 minutes after all is added A clear solution is obtained Add this cold solution, over a period of 15 minutes to a boiling solution of 400 cc concentrated H_2SO_4 in 800 cc H O—a brisk evolution of nitrogen occurs Boil further for 10 minutes and cool thoroughly A brown oily material which forms on surface solidifies and crystals form in solution Filter and wash with cold water The crude material melts from 109° to 114° C It can be purified by solution in alcohol, treatment with 'nuchar" and precipitation with H_2O, or by solution in dilute NaOH, warming to 60° with small quantity of "nuchar," filtering and acidification with dilute hydrochloric acid Cool and filter off crystals Yield = 34 Gm (85%) Pale yellow needles, m p —118°

5 Nitro 2-Hydroxy-1-Methyl Benzene—As was previously shown (4), (5), (6), (7), this compound was formed simultaneously with the 3 nitro 2 hydroxy toluene but in small quantities, and was extracted from the tarry residue of the steam distillation only by long and tedious boiling with successive portions of water By diazotization of the corresponding nitro toluidine and replacement of the diazo group by hydroxyl or by boiling the nitro toluidine with strong aqueous alkali (13) better yields are obtained However, the above toluidine is difficultly separated from the corresponding 3 nitro derivative

Borsche and Birkhout (14) prepared a homogeneous product in good yields by the oxidation of 5-nitroso-2-hydroxy-toluene with potassium ferricyanide We have devised a method, using nitric acid as the oxidant, which gives a pure nitro

compound without any contamination of dinitro or 3-nitro isomer, in yields of about 80–85% This is a simpler and shorter method than the ferricyanide oxidation which involves several days' standing

35 Gm of solid sodium nitrite are added to a suspension of 27 Gm of *o* cresol in 2 liters of ice water with mechanical stirring A solution of 9 5 cc of concentrated sulphuric acid in 200 cc of H_2O is then added during the course of 1 hour, keeping temperature below 5° by further addition of ice Allow to stand for 2 hours in cold Filter off the nitroso compound, wash with ice water This crude material can be used for the further oxidation A small sample recrystallized from benzene melted at 136°

27 5 Gm of the crude nitroso compound are suspended in 200 cc of a mixture of 1 part of concentrated nitric acid and 3 parts of water This is agitated and cooled from time to time to prevent decomposition After three hours the solid material is filtered and washed with water It is purified by solution in 5% sodium hydroxide, treatment with charcoal and precipitation with dilute HCl (10%), which is added dropwise while cooling the alkaline solution It separates as pale brownish yellow needles M p —91° The yield is 25 Gm or about 82%

6-Nitro 2 Hydroxy 1 Methyl-Benzene —Since this isomer cannot be prepared by nitration of cresol, it must be obtained by the replacement of the diazo group from the corresponding toluidine Green and Lawson (15) claimed that this nitro toluidine was obtained simultaneously with the 4 nitro 2 amino toluene by nitrating ortho toluidine in sulphuric acid They maintained that by fractional crystallization of the hydrochlorides they separated the more difficultly soluble 6-nitro toluidine We were unable to obtain any of this material even when the conditions of the toluidine nitration were varied Cunerth (16), by nitration of toluene, obtained besides the 2-4-dinitro toluene an oily substance (2 6 dinitro toluene) which he reduced with ammonium sulphide and claimed to obtain the 6 nitro toluidine His yields, however, are not given and the quantities of the oily dinitro toluene obtained are so small that we could not obtain a sufficient quantity for further reduction Beilstein (17) Holleman (18) and Cohen (19) attempted to obtain the 2 6-dinitro toluene by reduction of the 2-4 6-trinitro toluene to 2 6 dinitro *p* toluidine and subsequent elimination of the amino group by diazotizing and decomposing in absolute alcohol

The trinitro toluene is expensive, and when we attempted to reduce it by the above methods the yields were very poor only a trace of the dinitro toluidine being formed Staedel (20) claims that in nitration of *o* phthalyl toluidide, two nitro derivatives are formed which on hydrolysis yield two corresponding nitro toluidines one of which is the 6 nitro 2 amino toluene We are working on this method and may obtain some measure of success

NITRO-META-CRESOLS

2-Nitro 3 Hydroxy 1-Methyl-Benzene —This material was originally considered an impurity which occurred with 4 nitro 3 hydroxy-toluene However, Khotinsky and Jacobson Jacobman (21) showed that in using *m* toluidine in Denninger's (3) and Noelting's (2) methods, when the mixture was steam distilled, another volatile product was carried over which did not crystallize in the distillate It remained oily and also was somewhat soluble in the aqueous portion of the distillate The latter was extracted with ether after filtering off the crystalline 4-nitro derivative More of the oily substance can be expressed from the crystals On evaporation of the ether a dark oily substance remains which will not crystallize on cooling It cannot be distilled without decomposition It forms a dark red sodium salt Khotinsky prepared a methoxy derivative which melted at 88°

Gibson (22) could not isolate the 2 nitro cresol from this methoxy derivative He used the method of Kaufmann and de Pay (23) for the preparation of nitro resorcinol which involves first a disulphonation, then nitration with subsequent splitting off of the sulphonic acid groups by superheated steam From meta-cresol he obtained a yield of yellow oil (80%) which would not crystallize, but which gave a methoxy derivative melting at 54° and an acetyl derivative, m p —59°

By hydrolysis of this acetyl derivative and steam distillation of the product he obtained an oil which crystallized, m p —41° Hodgson and Beard (24) modified Gibson's method by using a stronger fuming sulphuric acid and higher temperature in the initial sulphonation and obtained a product which solidified after the first steam distillation We are using this method for the preparation of 2 nitro 3-hydroxy-toluene

4 Nitro 3 Hydroxy 1-Methyl-Benzene—This compound is obtained simultaneously with the 2 nitro and 6-nitro isomers as shown above (21) Khotinsky observed that using Staedel's (25) method and lowering the temperature in the reaction mixture to −8° to −5° the best yields of 4 nitro-3 hydroxy toluene were obtained with correspondingly smaller amounts of the 6 nitro isomer and practically none of the 2 nitro derivative

However, cooling and maintaining the reaction mixture at this temperature is rather difficult when using an ordinary ice-salt freezing mixture Since ice could not be added directly to the reaction it was necessary to find some material which could, and at the same time have no effect in the reaction We employed solid carbon dioxide (26) and found it rather easy to obtain temperatures as low as −15° to −20° C with addition of only small amounts of solid CO_2 However, such low temperatures at the beginning of the nitration caused the acetic acid to crystallize and made it very difficult to stir to obtain a smooth reaction We finally added only a small amount of CO_2, lowering the temperature to −5°, and then after adding some of the cresol mixture, maintained the temperature at −10° to −12° by gradual addition of solid CO_2 The nitration can be done quickly and easily controlled within the desired temperature range, and at the same time better yields of the 4-nitro-cresol are obtained due to the low temperature

100 Gm of *m* cresol are dissolved in 100 cc of glacial acetic acid This is added to a solution of 114 cc of concentrated nitric acid in 290 cc of glacial acetic acid which has been cooled to −5° by the addition of a few pieces of dry ice (solid CO_2) about the size of small nuts As the cresol mixture is added gradually increase the amount of dry ice until the temperature reaches −12° C and maintain thus until the end of the reaction The mixture is then added to 2 liters of ice water Filter off the precipitate and steam distil In the distillate the 4 nitro 3 hydroxy-toluene separates Yield 33 Gm or 25% It can be recrystallized by solution in alcohol and precipitation in water It separates as yellow needles M p —56° The residue from the steam distillation contains about 60% of 6 nitro 3 hydroxy toluene which can be extracted by boiling water

5 Nitro 3 Hydroxy 1 Methyl-Benzene—By direct nitration of *m* cresol or by simultaneous diazotization and nitration of *m* toluidine, this compound cannot be obtained due to the directing influence of the hydroxyl group It is first necessary to prepare the corresponding 5 nitro-3 amino toluene This also cannot be prepared from the *m* toluidine by direct nitration Staedel (27) prepared it by a complicated procedure He nitrated *p* acetyl toluidine using an excess of fuming nitric acid forming 3 5 dinitro *p* acetyl toluidine This is hydrolyzed by refluxing with alcoholic NaOH The resulting 3 5 dinitro *p* toluidine is then diazotized in concentrated nitric acid and the diazo nitrate added gradually to boiling absolute alcohol The mixture is cooled quickly and added to a double volume of water The precipitate is 3 5 dinitrotoluol M p —91° This is then reduced by alcoholic ammonium sulphide to 5 nitro-3 amino toluene In some of these steps the yields were not given and we found them to be rather low The nitro cresol is obtained from the nitro toluidine using the method as in the case of 4 nitro 2 hydroxy toluene The yield is low only about 30% Recrystallized from benzene it melts at 89° C

6-Nitro 3-Hydroxy-1-Methyl-Benzene—It is the chief product in all methods mentioned above in which either *m*-toluidine or *m*-cresol are the starting materials By allowing the temperature to rise to 5°, in the nitration using acetic acid, the proportion of the 6-nitro-cresol can be increased

In order to separate the 6-nitro cresol from the other isomers it was previously necessary to steam distil the mixture, the 6-nitro derivative being non-volatile with steam We have found, however, that by extracting with boiling benzene practically all of the 2-nitro and 4-nitro isomers are removed and the difficultly soluble 6-nitro-3-hydroxy toluene remains, which after recrystallization from water is pure M p —130° C

The steam distillation can also be avoided by nitration of *m*-toluidine in sulphuric acid, obtaining 6-nitro-3-amino-toluene without contamination of any isomers This can then be diazotized and converted into the corresponding cresol, according to the procedure employed in the preparation of 4-nitro-2-hydroxy-toluene and 5-nitro-3-hydroxy-toluene The yield in the last step averaged 60%

NITRO PARA CRESOLS

2 Nitro 4 Hydroxy 1 Methyl Benzene —By direct nitration of *p* cresol practically none of this isomer is formed Simultaneous diazotization and nitration of *p* toluidine according to method of Noelting (2), produces very little of the 2-nitro derivative However, Noelting (28) found that in nitrating *p*-toluidine in sulphuric acid the 2 nitro-4 amino toluene was obtained without any contamination of the 3 nitro toluidine, especially when large amounts of H_2SO_4 were used Copisarow (29) using an adaptation of the method of Holleman and Holflake (30) prepared 2 nitro *p* hydroxy toluene by nitrating *p* cresyl carbonate Lucas and Liu (31) studied this reaction and explained the introduction of the nitro group meta to the hydroxyl as due to the formation of the oxonium salt

Knecht (32) and Nevile and Winther (12) converted the nitro toluidine into nitro-cresol by diazotization and replacement of amino group, using gentle heating with dilute sulphuric acid

We found that these latter methods gave poor yields and in some cases no cresol at all, only tar resulting from the reaction We applied the Ullman method, as used in the case of 4-nitro-2-hydroxy-toluene, and found it gave better results Care must be taken that in the addition of the diazotized solution of the nitro toluidine to the boiling sulphuric acid, heating should be continued until the red color which first forms changes to yellow This may take over a half hour but it is necessary to obtain a good yield A reflux condenser should not be used during the reaction, inasmuch as it seems to retard the color change On cooling, the crude 2-nitrocresol separates The yield after recrystallization from water is 50–55% It separates as yellow prisms M p —77–78°

3-Nitro 4 Hydroxy 1-Methyl Benzene —Hofmann and Miller (4), Staedel (25), Frische (33) nitrated *p* cresol in acetic acid and obtained fair yields of 3 nitro derivative By use of the methods of Noelting (2) and Deninger (3), starting with *p* toluidine, we obtained good yields The nitro cresol can be obtained from the corresponding nitro toluidine (Nevile (12)), which in turn is prepared by nitration of *p* acetyl toluidine with fuming nitric acid (sp gr = 1 5) (34) Schultz (8) claimed yields of 85–90% by nitrating *p* cresol in benzene Using this method we were unable to duplicate the yields, averaging only about 40% We finally adopted the method of Brasch and Freyss (35), by which we obtained consistent yields of 70–75%

SUMMARY

1 Nine of the ten possible isomeric nitro-cresols have been studied

2 The methods of preparation described in the available literature have been discussed

3 We have improved these methods and given in each case the procedure assuring the best results as to yield, purity and low cost of preparation

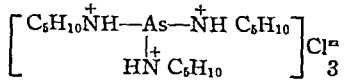
ARSENOUS CHLORIDE AND 1,4-DIOXANE *

BY G O DOAK

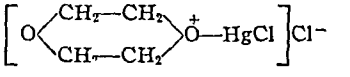
It has been shown in previous reports that arsenous chloride reacts with amines to form substituted ammonium halides, in which one, two or three of the chlorines were replaced by amine groups, the halogens being ionized in the resulting complex (1,9) Thus for example piperidine and arsenous chloride form the compound $(C_5H_{10}N\ HCl)_3As$ which may be written structurally as

* Scientific Section, A PH A Madison meeting, 1933



It is known that many oxygen compounds will form oxonium salts with acids and there is therefore a possibility that a compound in which the oxygen is relatively basic might combine with arsenous chloride to form a substituted oxonium halide similar to the ammonium halides formed between amines and arsenous chloride Bayer and Villiger (2) have pointed out that the same factors that influence the basicity of nitrogen do the same with oxygen Thus alkyl groups increase the basicity, phenyl groups decrease it They showed also that oxygen in such compounds as cineol and dimethyl pyrone is strongly basic Collie and Tickle (3) showed that dimethyl pyrone and diacetylacetone formed oxonium salts with a number of acids

Dioxane having become readily available in a fairly pure state, it seemed desirable to study its additive capacity toward $AsCl_3$ Paterno and Spallino (4) have shown that this substance combines with mercuric chloride to give a compound of the formula $(C_4H_8O_2)\ HgCl_2$ If this is regarded as an oxonium salt it will possess the structure



1,4-Dioxane also forms a sulphate $(C_4H_8O_2)_2H_2SO_4$, which may also be regarded as an oxonium salt

Experimental—Commercial 1,4 dioxane was dried for one week over metallic sodium and distilled, the fraction boiling 101–102° being taken 26 4 Gm ($^3/_{10}$ mole) were placed in a flask cooled with ice, and equipped with a mechanical stirrer, and 9 06 Gm ($^1/_0$ mole) of arsenous chloride added dropwise At first there was no sign of a reaction then a heavy white precipitate formed When all the arsenous chloride had been added the mixture was warmed The precipitate dissolved on slight warming but crystallized out on cooling The crystals were filtered off, and a second crop obtained by evaporating the solvent Yield of crystalline substance—6 Gm The crystalline product was soluble in ethyl alcohol, ethyl ether, acetone and benzene insoluble in cold heptane, soluble in warm heptane With water a precipitate of arsenous oxide was formed Melting point, 62° C It possessed a strong odor of arsenous chloride, appeared to be deliquescent and left an oily spot on paper

Chlorine analysis according to Stepanow (5) yielded 33 66% and 33 86%

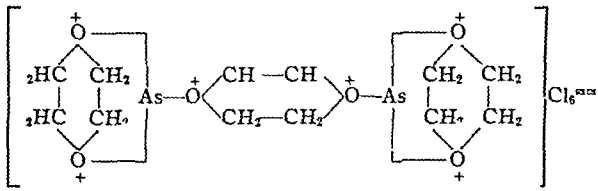
Arsenic analysis according to Morgan and Walton (6) yielded 23 84% and 23 69%

These results would correspond to the formula $(C_4H_8O)_32AsCl_3$ with a chlorine content of 33 67% and an arsenic content of 23 93%

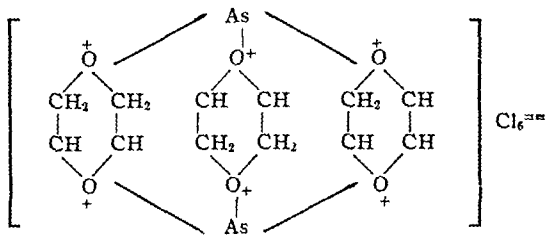
However, the substance appeared to be quite hygroscopic and it is possible that it may be a hydrate Thus for the formula $(C_4H_8O)\ AsCl_3\ 2H\ O$ the theoretical value for chlorine is 34 55% and for arsenic 24 55% The reaction was run a second time, taking precautions that all moisture was excluded and the crystals dried for two days over $P\ O_5$ in a vacuum The sample for analysis was transferred from the desiccator to a tared weighing bottle filled with absolute alcohol In this way the absorption of moisture from the air was prevented during the weighing process Chlorine found 33 57% It is thus apparent that the substance is not a hydrate but corresponds to the formula $(C_4H_8O)_3\ 2AsCl_3$

The molecular weight was determined in benzene by depression of the freezing point Molecular weight found 157, theoretical for $(C_4H_8O)_3\ 2AsCl_3$ 626 6 It is apparently highly dissociated in benzene solution Unless it ionizes to give three chlorine ions and a positive ion

(157 × 4 = 628) which seems unlikely the substance cannot be completely dissociated in benzene It would seem most probable that it dissociates into its component molecules $3C_4H_8O$ and $2AsCl_3$, which should give a molecular weight of 125 if completely dissociated According to the Nernst Thompson rule the dielectric constant of the solvent greatly influences the dissociation of the solute, hence, if this substance is dissolved in a solvent of higher dielectric constant there should be greater dissociation and hence a smaller molecular weight Acetone was chosen as a solvent (Dielectric constant for acetone 21 4, for benzene 2 82 (7)) Molecular weight was determined by elevation of the boiling point using the McCoy apparatus (8) Molecular weight found, 148 4 It would thus appear that the substance is highly dissociated more so in acetone than in benzene If it is an oxonium halide two structures are possible



I



II

I is the more probable as it contains five-membered rings as compared to ten-membered in II In support of the oxonium structure, the substance dissolved in absolute alcohol precipitates silver chloride with alcoholic silver nitrate solution, while arsenous chloride in absolute alcohol gives no precipitate with alcoholic silver nitrate This indicates that even in a solvent possessing such high dissociating powers as ethyl alcohol, chlorine is present as chloride ion

A STUDY OF THE CONSTITUENTS OF SIAM BENZOIN IN RELATION TO THEIR PRESERVATIVE ACTION ON LARD *[1]

BY WILLIAM J HUSA[2] AND DONALD E RILEY [3]

INTRODUCTION

The preservative action of benzoin on lard was discovered in France by Des champs (1) in 1843, and since that time benzoinated lard has become official in a dozen of the leading pharmacopœias of the world (2) Although Siam benzoin is widely used as a preservative of fats, the mechanism of its effect of retarding the development of rancidity has not been well understood The stabilizing effect of benzoin was commonly ascribed to the antiseptic action of its constituents, until Husa and Husa (3), in 1926, called attention to the inadequacy of this ex planation and indicated that the benzoin probably functions as a negative catalyst of oxidation A search of the literature having shown a lack of agreement as to which constituents of benzoin are effective in retarding the rancidity of lard, the effect having been variously ascribed to benzoic acid, cinnamic acid, volatile oil, resin and odorous constituents, Husa and Husa (3) carried out experiments which proved that benzoic acid and cinnamic acid are not effective in retarding the development of rancidity in lard Although the value of benzoin as a preservative of lard seemed well established in the older literature, some question arose as to whether or not it really exerted a preservative action, hence some experiments were carried out on this point in 1930 by Husa (4) and it was found that plain lard deteriorated several times as rapidly as benzoinated lard

It having thus been shown that Siam benzoin has a definite preservative action on lard, due to some constituents other than benzoic and cinnamic acids, the present investigation was carried out with the purpose of determining which constituents of Siam benzoin are responsible for the retardation of rancidity

HISTORICAL REVIEW

Constituents of Siam Benzoin —Benzoic acid was obtained by the destructive distillation o benzoin as early as 1556 (5) The acids of benzoin were studied by Kolbe and Lautemann (6 and by Lowe (7), the latter showed that at least some of the benzoic acid was present in the fre state Curtiss (8) obtained a higher yield of benzoic acid by sublimation than by extraction Schlickum (9) attempted to separate the constituents of benzoin and Moody (10) reported the presence of cinnamic acid in benzoin

In 1893, Fritz Ludy, under the direction of A Tschirch made the first thorough investiga tion of the constituents of Siam benzoin (11) Ludy found that Siam benzoin consisted mainly of a mixture of benzoic acid esters of two alcohols, benzoresinol and siaresinotannol Benzoresinol, $C_{16}H_{6}O$, was a white crystalline substance, melting at 272–274° C , several derivatives were pre-pared Siaresinotannol, $C_{12}H_{14}O_3$ was a brown, amorphous substance Ludy isolated the mix ture of the two esters by repeated precipitation of an ethereal solution with petroleum ether, re

[1] This paper is based on a thesis presented to the Graduate Council of the University of Florida by Donald E Riley, in partial fulfilment of the requirements for the degree of Master of Science in Pharmacy

[2] Head Professor of Pharmacy, University of Florida ,

[3] Holder of a University of Florida Graduate Scholarship, 1932–1933

moving the last traces of free benzoic acid with 0 1% NaOH solution This produced a light yellow, resin like, transparent, brittle odorless and tasteless mass melting at 65° C Upon saponification with KOH, it yielded 38 2% benzoic acid, 56 7% siaresinotannol and 5 1% benzoresinol Besides this resin mixture, Ludy found that Siam benzoin contained 0 15% vanillin, some free benzoic acid and 0 3% of an oily aromatic, neutral liquid which proved to be an ester of benzoic acid, the alcohol of the ester was thought to be possibly cinnamyl or benzyl alcohol, but owing to the small quantity was not definitely identified

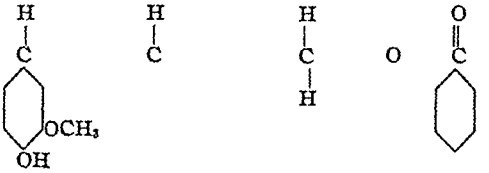
In the same year an article by J Salkind (12) contained statements that in Siam benzoin the benzoic acid is present as the ester of benzoresinol and resinotannol, with a small quantity free that vanillin was present and that cinnamic acid and benzyl benzoate could not be detected

Cocking and Kettle (13) reported on the analytical characteristics of benzoin

Our present knowledge of the constituents of Siam benzoin is based largely on the investigations carried out by Friedrich Reinitzer (14) He stated that Siam benzoin in the form of tears is entirely crystalline, melting at 59° C , and that upon warming to 40–50° C , its color changes to yellowish red and it finally becomes brown and amorphous due to oxidation

Reinitzer concluded that in its pure state, Siam benzoin consists mainly of crystalline coniferyl benzoate mixed with some free siaresinolic acid and benzoic acid and a small proportion of cinnamyl benzoate On standing in presence of air, the coniferyl benzoate tends to change to the brown amorphous form, probably with some oxidation and polymerization, the change being hastened by heat and light Traces of vanillin appear in older samples of benzoin

Coniferyl benzoate $C_{17}H_{16}O_4$, was obtained in colorless, monoclinic crystals, m p 72 8° C , best preserved in the dark at a low temperature in absence of air, to prevent change into the brown amorphous form This compound was called lubanol benzoate at first, but later lubanol was found to be identical with coniferyl alcohol According to Zinke and Dzrimal (15) coniferyl alcohol is identical with guaiacresinol, laricresinol and pinoresinol and the structure of coniferyl benzoate is as follows



Coniferyl benzoate

Siaresinolic acid was obtained in crystals m p 279° C , it was not affected by oxygen and did not turn brown Zinke and Lieb (16) reported a m p of 280–281 5° C for siaresinolic acid, and found the formula to be $C_{30}H_{48}O_2$ COOH

The composition of Siam benzoin was reported by Reinitzer as follows

Constituent	Fresh Resin	Old Resin
Crystalline coniferyl benzoate	77 8%	67 8%
Amorphous coniferyl benzoate		10 0
Free benzoic acid	11 7	11 7
Siaresinolic acid	6 0	6 0
Cinnamyl benzoate	2 3	
Cinnamyl benzoate and vanillin		0 3
Water	2 2	2 2
' Geweberste"		2 0
	100 0%	100 0%

The amorphous coniferyl benzoate is present in varying amounts depending on the age and conditions of storage of the resin

Tests for Rancidity —The first step in the development of rancidity is the addition of a molecule of oxygen at the double bond of an unsaturated fatty acid forming a peroxide In the second

step, the fat is oxidized by the peroxide, forming aldehydes, ketones and other compounds responsible for the characteristic odor and taste of rancid fats (17) Some of the tests for rancidity are based on detection or determination of the peroxides formed in the first step, while others involve the aldehydes, ketones, etc , formed in the second step

EXPERIMENTAL PART

Method of Determining Rancidity —It has long been known that rancid fats liberate iodine from potassium iodide Since the amount of iodine liberated from KI by a rancid fat gives a measure of the peroxides present in the fat, this principle has been used as the basis of a quantitative determination of incipient rancidity A number of methods are available based on this principle, differing only in details Four such methods were tried, including those of Szahlender (18), Wheeler (19), Caldwell and Dye (20) and Taffel and Revis (21), in our hands Wheeler's method appeared to give somewhat more consistent results than the others and hence it was used in the experiments which follow Wheeler's method is as follows

From 3 to 10 Gm of oil is dissolved in 50 cc of a mixture of 60% glacial acetic acid and 40% chloroform and 1 cc of saturated solution of KI is added The mixture is stirred by a rotary motion of the flask and after 1 minute 100 cc of water is added and the liberated iodine titrated with 0 1*N* or 0 01*N* sodium thiosulphate, using starch as indicator

In the data which follow, rancidity is reported in terms of the number of cc of 0 01*N* sodium thiosulphate solution required to decolorize the iodine liberated from KI by 1 Gm of the fat, this value has been designated as the "degree of rancidity" by Szahlender (18) and this expression is used in the present report

A substance might interfere with the test used by liberating iodine, preventing the liberation of iodine or absorbing it after it was set free This possibility was eliminated, each substance being tested by adding it to lard of known degree of rancidity and analyzing the mixture as usual

Effect of Varying Percentages of Benzoin —Deschamps originally used 40 Gm of benzoin per Kg of lard The B P , the British Pharmaceutical Codex and the French Codex specify 30 Gm of benzoin per Kg , while the U S P amount is 10 Gm per Kg Hence experiments were conducted, using varying proportions of benzoin, incorporated by the U S P method, with the exception that closed vessels were used

TABLE I —EFFECT OF VARYING PERCENTAGES OF BENZOIN ON THE RATE OF DEVELOPMENT OF RANCIDITY OF LARD SAMPLES STORED IN AN OVEN AT 50° C

Percentage of Benzoin	Degree of Rancidity after				
	0 Days	1 Day	4 Days	12 Days	27 Days
0 00	0 18	0 53	9 46	29 40	29 98
0 25	0 18	0 31	0 67	1 15	1 82
1 00	0 17	0 26	0 47	0 95	1 13
2 00	0 17	0 20	0 42	0 84	0 98
5 00	0 17	0 19	0 41	0 76	0 82

The results in Table I illustrate the definite preservative effect of Siam benzoin and indicate that with increasing quantities of benzoin lard becomes increasingly stable toward autoxidation, although the use of 2% and 5% of benzoin does not

show much advantage over 1%, which is the U S P proportion Some experiments using 3% benzoin likewise showed that this proportion has practically no advantage over 1% Results similar to those shown in Table I were obtained in repetitions of the experiment, the samples in some cases being stored in diffused light at room temperature The samples were stored in colorless glass ointment jars More rapid results were obtained in the 50° C oven, the development of rancidity being about 10 or 15 times as rapid as at room temperature

Preservative Effect of Volatile and Non Volatile Portions of Siam Benzoin—Tests were carried out to determine whether or not the volatile constituents of benzoin are responsible for the preservative action on lard Powdered Siam benzoin was sprinkled on glass wool in a round bottom flask placed in an oil-bath and purified hydrogen passed in through a tube leading to the bottom of the flask, the hydrogen after passing from this flask was bubbled through lard contained in a large test tube which was also placed in the bath The purpose of the hydrogen was to facilitate the passage of vapors from the benzoin into the lard A blank determination was conducted with all conditions the same, with the exception that no benzoin was used The operation was carried out in several steps using fresh lard each time The oil-bath was first held at 60° C for two hours, and then at 90° C 120° C and 150° C for two hour periods in each case After the 150° C period, the bath was allowed to cool to 60° C and the residue in the flask used to benzoinate a portion of lard From the results of this experiment, it appeared that the preservative constituents of the benzoin remained in the portion non volatile at 150° C, since this was the only fraction showing any preservative effect

The experiment was repeated, with the lard kept in a separate bath at 50° C, thus eliminating overheating of the lard and reducing the likelihood of volatile constituents passing on through the lard instead of being absorbed The bath containing the benzoin was heated for two hour periods at 60°, 90°, 120°, 150° and 200° C, and the residue used for benzoinating a portion of lard as before The results verified the previous conclusion that the preservative constituents were non volatile at 150° C, but in this case the residue remaining after 200° showed no appreciable preservative effect, nor was such an effect noticeable in the fraction volatile at 200° It seems likely that the benzoin decomposed at 200°, as the residue was quite dark in color, in this connection Reinitzer reported that benzoin gave up benzoic acid when heated to 120–140° C, and if heated more strongly gave odors of eugenol and finally of guaiacol

Since the results of both tests indicated that the preservative constituents were non-volatile at 150° C, attention was next devoted to methods of isolation of the non-volatile constituents of Siam benzoin

Isolation of Constituents of Benzoin—The coniferyl benzoate was isolated by a method recommended by Reinitzer (14) Large tears of benzoin, as free as possible from the brown crust were washed with enough ether (chilled to 5° C) to partially cover the benzoin The mixture was frequently shaken and carefully observed When the tears began to appear white, the ether was poured off, this treatment serving to remove the brown crust The residue was dissolved in ether at room temperature, filtered, and petroleum ether added until the solution became turbid Then the flask was loosely stoppered and set aside at 0° C to crystallize After 12 to 20 hours, crystals were obtained, usually melting at 65° to 68° C Upon repeated recrystallization in the same manner, the coniferyl benzoate was obtained in crystals of m p 72 2° C (corr), as compared with the m p of 72 8° C reported by Reinitzer To obtain such a product, eight to twelve recrystallizations are required For the preliminary work, the substance was recrystallized four or five times, and a product melting at 69° to 70° C was obtained For the final experiments the product of highest purity was used

The siaresinolic acid was separated and purified by one of the methods given by Reinitzer A mixture of benzoin and 70% acetic acid was allowed to stand, with occasional shaking, until the pieces of resin had disappeared, leaving a layer of light yellow material in the bottom of the flask After filtration, the residue was washed with 70% acetic acid and then with water, the crystalline mass was then dissolved in hot alcohol and water added until the solution showed a slight turbidity, the mixture then being set aside to crystallize By this method, crystals melting from 263 3° to 265 5° C (corr) were obtained Repeated recrystallization from alcohol gave a

product melting at 268 9° to 270 0° C (corr) Neither of these crystalline products showed the presence of coniferyl benzoate by use of the ferric chloride color test

Cinnamyl benzoate was prepared by treating cinnamyl alcohol with benzoyl chloride

Effect of Constituents of Siam Benzoin on Rate of Development of Rancidity of Lard —In testing the effect of the various constituents of Siam benzoin, they were added to lard in the proportions that would be present in benzoinating lard by the U S P method on the basis of the analysis of Reinitzer Thus the amount of crystalline coniferyl benzoate used in the lard was 77 8% of the amount of Siam benzoin that would be used in the U S P method, and the corresponding pro portions were 6% for siaresinolic acid and 4% for cinnamyl benzoate (the latter being greater than would be present in the U S P amount of benzoin) Cinnamyl benzoate was tested in the proportion of 1%, as it was thought that the sample of cinnamyl benzoate used probably contained some unchanged cinnamyl alcohol The results are given in Tables II and III

TABLE II —EFFECT OF CONSTITUENTS OF BENZOIN ON THE RATE OF DEVELOPMENT OF RANCIDITY OF LARD SAMPLES STORED IN AN OVEN AT 50° C

Added Substance	Degree of Rancidity after				
	1 Day	6 Days	14 Days	35 Days	70 Days
None	0 36	2 08	6 50	13 20	14 85

Benzoin	0 26	0 61	0 77	0 83	0 96

* 0 1 Gm used in 50 Gm lard

The results indicate that coniferyl benzoate is the ingredient of Siam benzoin responsible for the preservative action on lard Siaresinolic acid has practically no preservative effect Vanillin gives some protection when present to the extent of 0 1%, but this proportion is higher than could be obtained from the U S P amount of Siam benzoin Cinnamyl benzoate showed no effect when used in the quantity that would be present in the U S P amount of Siam benzoin and further tests showed that it was likewise ineffective when more than 25 times this pro portion was used Cinnamyl alcohol had no effect The results with benzoic acid verified the previous report of Husa and Husa (3) that this compound has no effect on the development of rancidity in lard

It had previously been found by Husa and Husa (3) that Siam benzoin gives a pronounced red color in the Kreis test for rancidity In the present study, it was

found that coniferyl benzoate and vanillin similarly interfered with the use of the Kreis test However, since siaresinolic acid gave no color with the Kreis reagent, the Kreis test was used in following the rancidity of lard alone and lard containing siaresinolic acid The results fully confirmed the lack of preservative effect on the part of siaresinolic acid

As a further check on the results, observations were made as to the color changes in samples of ointment of potassium iodide, using the methods described by Husa (4) The results verified the previous conclusions as to the effects of coniferyl benzoate, siaresinolic acid and vanillin

The results with coniferyl benzoate, siaresinolic acid, benzoic acid and benzoin were also confirmed by the von Fellenberg (22) test for rancidity, this being a color test based on reaction of a fuchsin-sulphurous acid reagent with the aldehydes of the rancid fat

Following the regular procedure using Wheeler's test, it was found that Siam benzoin which had been stored for three months in an oven at 50° C , during which time it had turned to a reddish brown color, showed very inferior preservative power as compared with U S P benzoin

Since Siam benzoin does not dissolve completely in lard in the U S P benzoination process, it was of interest to observe the solubility in lard of the various constituents of benzoin In the proportions designated in the experiments, coniferyl benzoate and vanillin dissolved completely, while siaresinolic acid dissolved only partially

It has generally been found that negative catalysts of oxidation are themselves susceptible to oxidation, the lack of stability of coniferyl benzoate in air is thus in accord with the general rule

CONCLUSIONS

The constituent of Siam benzoin responsible for the preservative effect on lard is coniferyl benzoate Vanillin gives some retardation of the development of rancidity when present to the extent of 0 1%, but this proportion is higher than could be obtained from the U S P proportion of benzoin The other constituents of Siam benzoin, *i e* , siaresinolic acid, benzoic acid and cinnamyl benzoate, do not exert a preservative effect on lard

A COMPARATIVE STUDY OF MARYLAND SENNAS *[1]

BY FRANK J SLAMA

I Introduction

The Maryland sennas, with the exception of *Cassia Medsgeri*, were studied by botanists as far back as the seventeenth century At that time, Tournefort (1656–1708) placed them in the tribe *Cassia* and later Linné, in his Species Plantarum left this classification unchanged Willdenow, in his work, also accepted the classification of his predecessors However, in recent years botanists have questioned this classification and have divided the Maryland sennas into two Groups—*Cassia*, which includes *Cassia Marilandica* and *Cassia Medsgeri*, and *Chamæcrista*, which includes *Cassia nictitans* and *Cassia Chamæcrista* As a result, various papers have been written for and against the separation of the Maryland sennas but up to the present time, no definite conclusions have been reached

Most of the work attempting to decide the question has been carried out only upon the flowers and pods In this paper the leaflets of the Maryland sennas are studied and from their study it appears that results are obtained which will be of value in deciding this question As the study progressed, it became evident that the leaflets of the Maryland sennas possessed characteristics differing greatly from those of the official senna leaflets and it was decided best to include their study with that of the Maryland sennas

The leaflets of six sennas, therefore, were studied, the two official sennas, those of *Cassia Senna* and *C angustifolia*, and those of the four Maryland sennas, namely, *C Marilandica*, *C Medsgeri*, *C nictitans* and *C Chamæcrista* The official senna leaflets were obtained from stock while the Maryland sennas were obtained in the vicinity of Baltimore, Md, *C Marilandica* being found at Owings Mills, Md, and

* Scientific Section, A Ph A, Madison meeting, 1933

[1] From the laboratory of Charles C Plitt, Professor of Botany and Pharmacognosy, School of Pharmacy, University of Maryland Thesis submitted to the Faculty of the Graduate School of the University of Maryland in partial fulfilment of the requirements for the degree of Master of Science

on the Hillen Road, *C nictitans*, on Gwynn Falls Driveway and in Brooklyn, Md , while *C Chamæcrista* was gathered at Garland, Rosedale and Essex, Md *C Medsgeri* which is rarely found in the neighborhood of Baltimore was discovered (1) at a point east of Carney, Md

II Descriptive Studies

a macroscopic

1 Average Sizes of Leaflets—The Maryland senna leaflets were pressed immediately after collecting and within an hour they were measured The average sizes are as follows *C Marilandica*, 42 68 mm by 15 48 mm , *C Medsgeri*, 35 15 mm by 13 25 mm , *C nictitans*, 8 45 mm by 2 25 mm and *C Chamæcrista*, 10 75 mm by 3 25 mm

The official senna leaflets were taken from stock and their average sizes are *C angustifolia*, 26 mm by 7 85 mm , *C Senna*, 22 6 mm by 8 1 mm

2 Venations—Examining the venation of the leaflets, it is readily seen that the venation occurring in *Cassia nictitans* and *C Chamæcrista* differs greatly from that of the four remaining species In these two sennas the midrib is closer to one margin and consequently it divides the leaflets into two unequal parts, the larger showing the veins more numerous and longer and usually with three veins originating at the petiolule The average leaflet of the official sennas, *C Marilandica* or *C Medsgeri*, has the midrib running practically through the center of the leaflet and veins on each side of the midrib similar in size and number Furthermore, the veins in the leaflets of *C nictitans* and *C Chamæcrista* are seen extending very close to the margins without any apparent division into veinlets, whereas the four remaining senna leaflets show the terminal branches of the veinlets anastomosing near the margins This effect, which is seen more clearly in *C Marilandica* and *C Medsgeri*, is also characteristic of the leaflets of the official sennas This peculiar effect is never found in either *C nictitans* or *C Chamæcrista*

3 Other Observations—(*a*) *C Marilandica* and *C Medsgeri* are perennials, *C nictitans and C Chamæcrista* are annuals Their seeds are found germinating during first week of May, about the same time shoots of *C Marilandica* and *C Medsgeri* are seen sprouting from underground rootstocks The official sennas are shrubs

(*b*) The Maryland sennas behave rather uniformly also in the fall of the year About October 1st, they begin to disappear, the annuals dying to the ground and the perennials losing their leaves Within two or three weeks, they have practically disappeared

b microscopic

1 A Study of the Stomata—The epidermis after removal is dehydrated by passing it through, and allowing it to stay from half to one hour in each of the following alcohols—35%, 50%, 70%, 85%, 95% and absolute alcohol in the order given Before passing the epidermis from 50% to 70% alcohol, the specimen is stained for five minutes in Delafield's hematoxylin and then washed in 50% alcohol From absolute alcohol it is passed into oil of clove where it remains for ten minutes It is then mounted in Canada balsam

Study of the Upper Surfaces of the Leaflets —All the stomata were examined under a magnification of 450 diameters Figures 1, 2 and 3 show the upper epidermis of *C Marilandica*, *C Medsgeri* and *C nictitans*, respectively Superficial examination shows them free of stomata, as in the figures, closer study shows, however, that some stomata may be present, thus *C Marilandica* and *C Medsgeri* may have stomata occasionally only along the midrib whereas in *C nictitans*, stomata may be found along the midrib, at the base and apex and near the margins, the number along the midrib increasing from the base to the apex However, if the epidermis of that portion of the leaflet, a short distance within the margin and from the midrib, is examined, stomata are practically absent

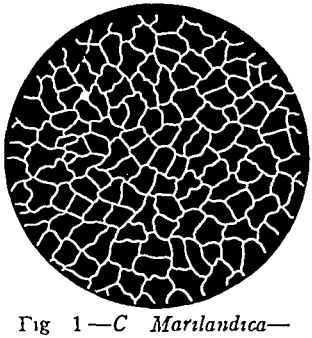

Fig 1 —*C Marilandica*— Upper epidermis

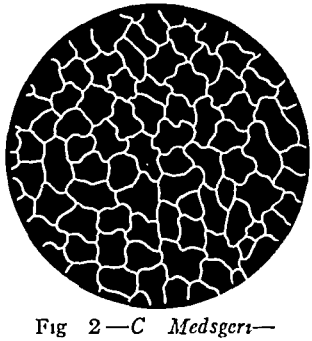

Fig 2 —*C Medsgeri*— Upper epidermis

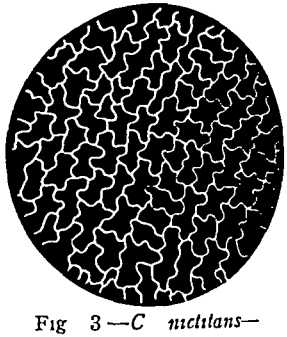

Fig 3 —*C nictitans*— Upper epidermis

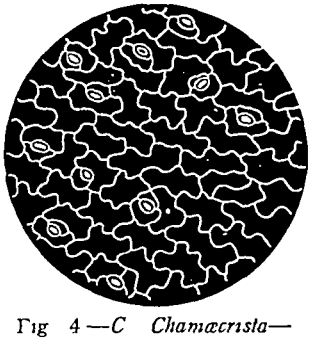

Fig 4 —*C Chamæcrista*— Upper epidermis

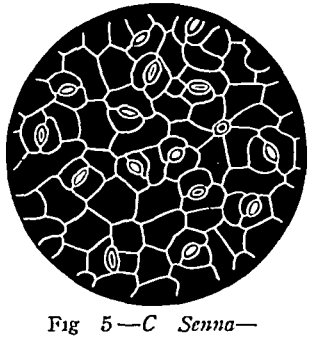

Fig 5 —*C Senna*— Upper epidermis

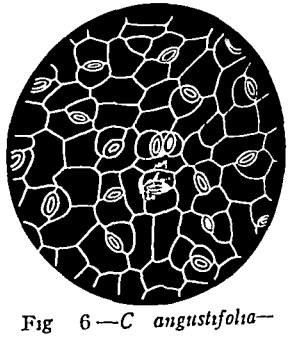

Fig 6 —*C angustifolia*— Upper epidermis

A study of the upper epidermis of the other three species of *Cassia*, *C Chamæcrista* (Fig 4), *C Senna* (Fig 5), *C angustifolia* (Fig 6), reveals that all three are provided with stomata In *C Chamæcrista* they are distributed uniformly, whereas in the remaining two, they are not, there being in each fewer stomata along the margin

Characteristic of the stomata of the upper epidermis of *C Senna* and *C angustifolia* (Fig 6) is the occasional touching of the guard cells of two adjacent stomata More frequent is the separation of two stomata only by their neighboring cells The upper epidermises of the Maryland sennas studied never have the guard cells of two stomata touching *C Chamæcrista* frequently shows the neighboring cells separated by one epidermal cell, whereas in *C nictitans*, the neighboring cells are rarely separated by one epidermal cell but by two or more, usually many

Study of the Lower Surfaces of the Leaflets —The stomata on the lower epidermis

of the six sennas examined are more uniformly distributed, although their number may decrease along the margins Figures 7 to 12, inclusive, show the lower epidermises of the sennas and it is readily seen that the stomata of the official sennas, upon the whole, are the largest The stomata of *C nictitans* and *C Chamæcrista* often are situated not in the center of the two neighboring cells, but pulled toward one neighboring cell, making that cell much smaller than the other This condition also occurs in the official sennas and in *C Marilandica* and *C Medsgeri* but to a lesser degree However, with *C nictitans* and *C Chamæcrista* this is markedly so and aids in their identification *C nictitans* has stomata which are smaller than those of *C Chamæcrista*, there is a greater number per square mm and the stomata of the former are nearly spherical in outline while those of the latter are elliptical

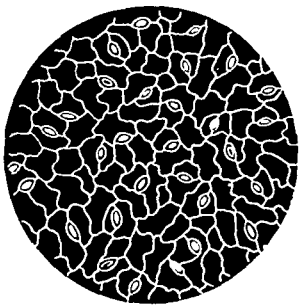

Fig 7—*C Marilandica*—Lower epidermis

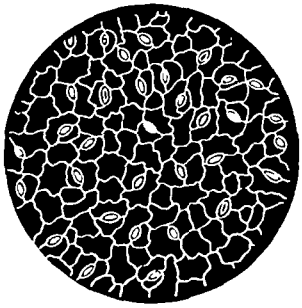

Fig 8—*C Medsgeri*—Lower epidermis

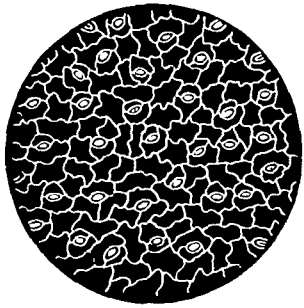

Fig 9—*C nictitans*—Lower epidermis

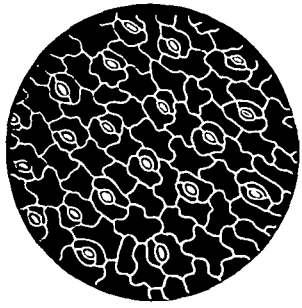

Fig 10—*C Chamæcrista*—Lower epidermis

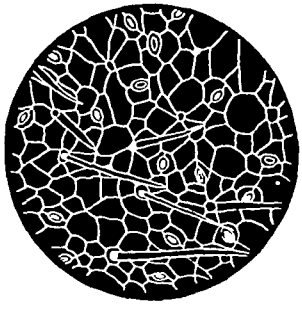

Fig 11—*C Senna*—Lower epidermis

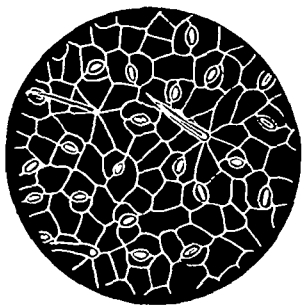

Fig 12—*C angustifolia*—Lower epidermis

Table I gives the results of the study of the stomata found on the upper and lower surfaces of the official sennas and of the Maryland sennas

TABLE I—STOMATA OF THE OFFICIAL SENNAS AND OF THE MARYLAND SENNAS

Plant	Stomata per Sq Mm U E	Stomata per Sq Mm L E	Average Size Stomata (Microns) U E	Average Size Stomata (Microns) L E	Ratio of Shorter Diameter to Larger U E	Ratio of Shorter Diameter to Larger L E
Alexandria Senna	189 4	215 1	21 73 × 28 68	20 16 × 26 73	0 758 to 1	0 754 to 1
India Senna	203 5	266 4	21 95 × 29 92	18 76 × 26 81	0 73 to 1	0 7 to 1
Cassia Marilandica		349 9		22 08 × 28 46		0 776 to 1
Cassia Medsgeri		250 5		17 15 × 21 98		0 78 to 1
Cassia Chamæcrista	143	219 7	13 89 × 20 56	16 53 × 23 51	0 68 to 1	0 703 to 1
Cassia nictitans	?	358 0	13 06 × 16 77	14 23 × 19 2	0 78 to 1	0 742 to 1

In the first column for *C nictitans*, a question mark is placed Whether this space should be left blank or filled in, depends entirely upon the portion of the leaflet examined If the upper epidermis is examined close to the margins or along the midrib, and as along these areas stomata are found, this space should be filled However, in order to give the approximate average size of the stomata on the upper epidermis, ten were examined and the results were included in Table I

The table shows (1) the stomata of the upper and lower epidermis of Alexandria Senna are approximately the same size, (2) the stomata on the lower epidermis of India Senna are somewhat smaller than those of the upper epidermis, (3) the difference in the sizes of the stomata of the official sennas could hardly be used as a means of separating them under the microscope, (4) *C Marilandica* and *C Medsgeri* have no stomata upon the upper surfaces unless the area near the midrib is examined and there they are found occasionally, (5) with *C Chamæcrista* stomata are found on both surfaces of the leaflet, the stomata on the upper surface being the smaller, (6) *C nictitans* has stomata uniformly distributed on the lower epidermis only, (7) the stomata of *C Chamæcrista* are larger than the stomata of *C nictitans* and (8) the stomata of the official sennas upon the whole are the largest studied

2 Neighboring Cells —The results of a study of the neighboring cells of the sennas are shown in Table II

TABLE II —NEIGHBORING CELLS

Plant	No Stomata Examined	Stomata (2 N C)	Stomata (3 N C)	Stomata (4 N C)	Stomata (5 N C)
Cassia Senna	150	144	6		
C angustifolia	150	129	17	4	
C Marilandica	300	203	65	28	4
C Medsgeri	315	291	14	7	3
C Chamæcrista	220 (U E)	220			
	310 (L E)	310			
C nictitans	425	357	62	6	

This table shows (1) that stomata with two neighboring cells predominate, (2) making use of the possibility of five neighboring cells we can readily divide the above sennas into three groups, the official sennas without five neighboring cells, two Maryland sennas with five neighboring cells and two Maryland sennas without five neighboring cells, (3) furthermore each of the three main groups may be separated into its two components thus *C angustifolia* is readily separated from *C Senna* as the former exhibits a greater number of stomata with three neighboring cells and it is the only official senna having stomata with four neighboring cells, stomata with three neighboring cells and four neighboring cells occur to a greater degree in *C Marilandica* than in *C Medsgeri*, and *C Chamæcrista* always shows its stomata accompanied by only two neighboring cells while in *C nictitans* stomata with three and four neighboring cells are present

3 Epidermal Cells —Attempt was made to separate the sennas by means of a study of their epidermal cells It was noted that the thickness of the cell wall is of no value as approximately the same thickness of cell wall exists in each senna and that the epidermal cells vary in shape to such an extent as to make the measuring of the cells of no value, nevertheless, the epidermal cells, like the neighboring cells, have characteristics which are of value in separating the sennas into three groups

Because of the trichomes on the epidermis, the official sennas have certain epidermal cells that are very characteristic The base of each hair is surrounded by four to nine epidermal cells similar to the spokes of a wheel so that the portion of each cell adjacent to the base of the hair is more narrow than that at the opposite side Usually, six epidermal cells accompany a hair in each of the official sennas, and with both sennas, variability in the shape of these cells occurs

The other epidermal cells are of various shapes, but the outline of each is made up of straight lines, or lines that are just slightly curved

Maryland sennas show hairs to be absent and, as a result, the characteristic epidermal cells that are present in the official sennas, are absent

The epidermal cells of *C Medsgeri* and *C Marilandica* are more undulate on the lower epidermis and are practically the same size as the largest neighboring cell The epidermal cells of *C Marilandica* are approximately the same size as those of *C Medsgeri* but those of *C Marilandica* tend to be square-like while those of *C Medsgeri* are very undulate Now, just as in the case of their neighboring cells, certain ones of *C Medsgeri* may look like those of *C Marilandica* and certain ones of *C Marilandica* look like those of *C Medsgeri*, so the epidermal cells of *C Marilandica* may sometimes become undulate while those of *C Medsgeri* appear square-like, but an examination of the center portion of the leaflets will show the typical cells of each species

In comparing *C nictitans* and *C Chamæcrista*, the former shows the outline of the epidermal cells to be more undulate and its epidermal cells are on an average, slightly larger than the average neighboring cells, while *C Chamæcrista* exhibits epidermal cells which are much larger than the average neighboring cells In both cases, the epidermal cells found on the upper epidermis are slightly larger than those on the lower

4 Epidermal Hairs —On the upper and lower epidermis of *C Marilandica*, *C Medsgeri*, *C Chamæcrista* and *C nictitans*, hairs are absent whereas with the official sennas, hairs are present on both surfaces The apices and the midribs of the leaflets of the Maryland sennas also were examined for hairs with the following results Occasionally hairs are present on the tips of *C Marilandica* and *C Medsgeri* leaflets and rarely, also on the midrib, but hairs are not found either on the apices or midribs of leaflets of *C nictitans* and *C Chamæcrista*

The arrangement of the epidermal cells around the hairs of the official sennas is already mentioned These arrangements were studied and the number of arrangements occurring on each epidermis was counted to ascertain if there was enough variation in them to be of value in identifying the official sennas As the hairs are more numerous on the lower surface of *C Senna* leaflets, more arrangements should be found here, and this proved to be true

For simplicity, each arrangement will be called an epidermal hair apparatus and will be designated by the abbreviation E H A This abbreviation when used will always represent the four to nine epidermal cells which arrange themselves in a circular fashion around the base of any hair The following table shows the distribution of hairs

TABLE III —DISTRIBUTION OF HAIRS

Plant.	Epidermis Examined	Av No E H A in a Field	Average Size of Hairs	Size of Largest Hair
India Senna	Upper	0 06	105 0 microns long	188 4 microns long
	Lower	1 83	13 9 microns in dia	19 3 microns in dia
Alex Senna	Upper	1 72	114 0 microns long	216 0 microns long
	Lower	12 10	12 5 microns in dia	16 6 microns in dia

NOTE In each case, 50 fields were examined

From the results obtained, it is readily seen that, by means of the E H A 's the upper epidermis of *C angustifolia* can be distinguished from that of *C Senna* and the same holds especially true for the lower surfaces of these two official sennas But it would be more difficult to distinguish the upper epidermis of *C Senna* from the lower of *C angustifolia*, the average of the E H A 's of the former being 1 72 and of the latter 1 83 Here the E H A 's are of no help and another method for their separation must be applied Under the heading of neighboring cells, it was concluded that stomata with three neighboring cells are found more often in *C angustifolia* and stomata with four are rarely found in *C Senna* If this method is applied, the upper epidermis of *C angustifolia* is recognized as it shows stomata with three neighboring cells to be present more often and occasionally a stoma with four, the absence of which would determine the lower epidermis of *C Senna*

Hairs are found along the midrib, upon both epidermal surfaces of *C angustifolia*, being more numerous upon the lower surface Upon both surfaces the number of hairs increase as one passes from apex to the base of the leaflet The distribution of hairs on *C Senna* is the same as on *C angustifolia*, except that they are far more numerous, exceeding the number found there, vastly

The apices of one hundred leaflets of each of the two official sennas were examined *C Senna* usually shows hairs present, the number varying from one to many, occasionally, however, an apex without a single hair is observed *C angustifolia* usually shows apices without hairs, but occasionally an apex with hairs is noted

5 *Margins* —The margins of the senna leaflets were studied and the sennas with similar margins were grouped together, three groups being formed, the official sennas, *C angustifolia* and *C Senna* form one, *C Marilandica* and *C Medsgeri* another and *C nictitans* and *C Chamaecrista* the third, the following table making this clear

TABLE IV —COMPARISON OF MARGINS

Plants	Size of Largest Hair	Remarks
Alex Senna		The larger hairs appear on margins of India Senna
India Senna	52 25 microns long 23 5 microns in dia	In both sennas hairs are usually found with long diameters almost parallel to the margin and their tips pointing toward the apex Hairs are found at very irregular intervals
C Marilandica	933 microns long 24 microns in dia	The margins of these leaflets show large hairs *C Medsgeri* usually exhibits hairs parallel to the margin and tips of hairs touching the margin With *C Marilandica* hairs usually occur almost perpendicular to the margin
C Medsgeri	587 microns long 27 microns in dia	
C Chamaecrista	Hairs are absent Serrated margins	In *C Chamaecrista* the serrations extend from the base to the apex on both margins *C nictitans* shows one margin completely serrated and the other serrated about 1/5 of the distance from the base to the apex
C nictitans	Hairs are absent Serrated margins	

To summarize, the official sennas have margins of leaflets almost free of hairs, only occasionally is a small hair found, the margins of leaflets of *C Medsgeri* and *C Marilandica* have large hairs, and the margins of the leaflets of *C Chamaecrista*

and *C nictitans* are more or less serrated, those of the former being serrated along both margins, whereas in *C nictitans*, one margin alone is completely serrated and the other is serrated only about one-fifth of the way from the base to the apex

6 Apices—The results of a study of the apices of the senna leaflets studied are shown in Table V

TABLE V—A COMPARISON OF APICES

Plant	Av Size Tip	Remarks
C angustifolia	261 microns long 250 microns wide	The apices are about as long as wide and are either conical or ball-shape *C Senna* usually shows apices with hairs present *C angustifolia* usually shows apices without hairs
C Senna	246 microns long 246 microns wide	
C Marilandica	584 microns long 211 microns wide	These sennas exhibit apices which are similar but those of *C Marilandica* are about three times as long as wide The apices of *C Medsgeri* are about twice as long as wide The apices taper slightly
C Medsgeri	316 microns long 175 microns wide	
C Chamæcrista	283 microns long 150 microns wide	The apices of *C nictitans* are about three times as long as wide and those of *C Chamæcrista* are about twice as long as wide The apices taper to a sharp slender point
C nictitans	433 microns long 133 microns wide	

The above table shows that it is possible to separate the sennas into the 6 species by the appearance of their apices

7 Petiolules—It was also found that the sennas could be separated into three groups by means of the petiolules which are classified as large, medium or small

C Marilandica and *C Medsgeri* have the large petiolules, 500 to 750 microns wide and 1250 to 2100 microns long, the official sennas, the medium-sized, 500 to 850 microns wide and 675 to 1100 microns long and with *C nictitans* and *C Chamæcrista*, the petiolules are very small The chart that follows shows the most important characteristics of the petiolules

Petiolules
- Large
  - Rarely without hairs, hairs numerous—*C Medsgeri*
  - Occasionally with hairs hairs not numerous—*C Marilandica*
- Medium
  - Hairs numerous on petiolules and along outlines of petiolules—*C Senna*
  - Hairs not numerous on petiolules and along outlines of petiolules—*C angustifolia*
- Small—*C nictitans* or *C Chamæcrista*

8 Glands—The petioles of the sennas were examined for the presence of glands Numerous petioles of the official sennas were obtained from stock and in every case, no glands were seen

On the petioles of the Maryland sennas glands are always present Those of *C Marilandica* and *C Medsgeri* have conical glands while *C nictitans* and *C Chamæcrista* show cup shaped glands beneath the lowest pair of leaflets The latter plant possesses the larger cup-shaped glands A comparison of the glands is shown in Table VI

TABLE VI —A COMPARISON OF GLANDS

Plant	Glands on Petioles	Remarks
C Senna	Absent	
C angustifolia	Absent	
C Marilandica	Present	Conical or club shaped glands
C Medsgeri	Present	Conical glands
C Chamaecrista	Present	Large cup shaped glands beneath the lowest pair of leaflets
C nictitans	Present	Small cup shaped glands beneath the lowest pair of leaflets

9 *Cross Section of Leaflets* —In studying the cross sections of the leaflets, the palisade tissue was the determining factor in the separation of the official sennas and the Maryland sennas The official sennas (2) possess two layers of palisade tissue, one layer near the upper surface and another, near the lower surface of the leaflet However, all the Maryland sennas show but one layer of palisade tissue which is adjacent to the upper surface

10 *Powdered Senna Leaflets* —All the sennas were examined, according to Sayre's (3) method A No 60 powder was made of each senna and to one half Gm of the powder in a small homeopathic vial, 6 Gm of a solution of equal parts of glycerin (sp gr 1 25) and water, were added The official sennas are readily differentiated, as Alexandria senna[1] shows 4 4 hair tips and India senna[2] one hair tip in a field, the low power objective being used These results are similar to those obtained by Sayre

The Maryland sennas may be identified as follows *C Marilandica* and *C Medsgeri* are determined by the shape of their epidermal cells although the number of stomata in the field, their size and the number of neighboring cells can be used to confirm the identification *C nictitans* and *C Chamaecrista* are also recognized by their epidermal cells and by the shape and size of their stomata The epidermal cells of *C Chamaecrista* are less undulate and larger than those of *C nictitans*, while the latter has smaller, nearly spherical stomata in contrast to those of *C Chamaecrista* which are elliptical and of which there are fewer per field

A No 60 powder was used to study the number of tips of hairs in the field, and, for the recognition of the powdered sennas, a No 20 powder In every case, the sample of the powdered leaflet was treated with a drop or two of a saturated aqueous solution of chloral hydrate for three to five minutes prior to its examination

11 *Microsublimation was also carried out but the results were not conclusive*

III COMPARISONS AND CONCLUSIONS

A comparison of the senna leaflets studied is shown in the following table

TABLE VII —A COMPARISON OF SENNAS

Group I *C Senna* and *C angustifolia*	Group II *C Marilandica* and *C Medsgeri*	Group III *C Chamaecrista* and *C nictitans*
1 Terminal branches of veinlets anastomose near the margins of the leaflets Effect is less pronounced than that of Group II	1 Terminal branches of veinlets anastomose near the margins of the leaflets	1 Terminal branches of veinlets end abruptly near the margins Veinlets do not anastomose

[1] *Cassia Senna*

[2] *Cassia angustifolia*

2 Largest stomata studied Occasionally, there are two stomata with their guard cells touching Stomata are accompanied by characteristic neighboring cells	2 Stomata are practically absent from the upper surfaces of these leaflets	2 Both surfaces of these leaflets show stomata present
3 Hairs are present on both surfaces	3 Hairs are absent from both surfaces	3 Hairs are absent from both surfaces
4 Occasionally very small hairs are found along the margins	4 Hairs of large size are present along the margins	4 Hairs are absent along the margins Margins are serrated
5 Two rows of palisade tissue	5 One row of palisade tissue	5 One row of palisade tissue
6 Petioles are devoid of glands	6 Petioles show the presence of conical or club shaped glands	6 Petioles show the presence of cup shaped glands
7 Plants are shrubs	7 Plants are perennial herbs	7 Plants are annuals
8 Apices are conical or ball shape	8 Apices taper slightly	8 Apices taper to a sharp, slender point

CONCLUSIONS

In conclusion, an examination of the three groups will bring out the following

(1) That there are three groups, each group being distinct in itself The resemblance of any group to each of the other two, is merely superficial

(2) The differences between Group I and the other two are far greater than the differences between these two groups It would therefore be only logical that, if Group III is separated from *Cassia*, Group I should also be separated from this genus We would therefore have Group I composed of the official sennas, consisting of *Cassia angustifolia* and *C Senna* (*C acutifolia Delile*), considered under a new Genus, *Senna*, and then recognized as *Senna angustifolia* and *S acutifolia*, Group II composed of *Cassia Marilandica* and *C Medsgeri* continued under Genus *Cassia* and Group III, composed of *Cassia nictitans*, and *C Chamæcrista*, under Genus *Chamæcrista* and known as *Chamæcrista nictitans* and *C fasciculata*, as already recognized by botanists

ABSTRACT OF PAPER PRESENTED BEFORE SECTION ON PRACTICAL PHARMACY AND DISPENSING A PH A , WASHINGTON MEETING 1934

'A Study of the Physical and Chemical Properties of a Number of Specimens of Calomel of American and European Manufacture,' by C H LaWall and J W E Harrisson

The authors have made an investigation of fourteen commercial samples of calomel, nine of which are of American manufacture and five of European manufacture

Especial attention was paid to the physical properties and the microscopic appearance, in the light of the U S P requirement that it should show only small isolated crystals when viewed under a lens having a magnifying power of one hundred diameters '

BIBLIOGRAPHY OF PHARMACEUTICAL RESEARCH

Compiled by A G DuMez, Reporter on the Progress of Pharmacy

All articles in these lists will be presented in abstract form in the bound volumes of the YEAR BOOK which is issued annually Those desiring abstracts immediately can obtain them for a fee of one dollar each by communicating with A G DuMez University of Maryland, School of Pharmacy, N W cor Lombard and Greene Sts , Baltimore, Maryland

THE SOLUBILITY OF POTASSIUM CHLORIDE IN AQUEOUS POTASSIUM IODIDE SOLUTIONS *

BY S D HARRIS AND W G CHRISTIANSEN

In connection with other studies in progress in this laboratory, it became necessary to determine the effect of varying amounts of potassium chloride on the solubility of potassium iodide in water The determinations were carried out at 20°, 30° and 40° C, and the results are shown graphically in Fig 1 and in detail in the experimental part As was expected, the addition of successively larger quantities of KCl to saturated KI solutions depressed the solubility of each until an equilibrium was reached

In addition the solubility of KCl in terms of grams of salt per 100 cc of solution was determined for the same temperatures

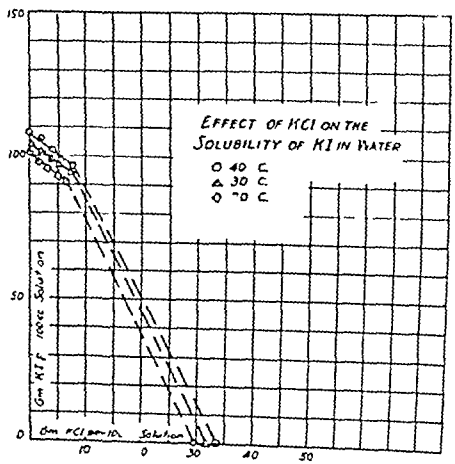

Fig 1

* Section on Practical Pharmacy and Dispensing A PH A, Madison meeting 1933

EXPERIMENTAL

The determinations were carried out in the following manner A saturated solution of pure potassium iodide was prepared at 50° C and cooled to the desired temperature The solution was well stirred to prevent supersaturation and the separated salt allowed to settle Fifty cc of the clear supernatant liquor was pipetted into a large test tube by means of a pipette calibrated at the particular temperature and the desired quantity of KCl ground to 80 mesh added The tube was sealed by a blast lamp and attached to a shaking device in a thermostat maintained at the desired temperature to within ±0 05° C Shaking was continued for 24 hours after which the undissolved salt was allowed to settle Ten-cc portions were then removed by a calibrated pipette and diluted to 1000 cc Total halogen was determined in this dilution by Volhard s method and potassium iodide by KIO_3 solution From these values the composition of the solution in terms of grams of KCl and KI per 100 cc of solution was calculated

BROOKLYN N Y

A STUDY OF FOWLER'S SOLUTION

BY CHARLES SCHWARTZ, JR *

The fact that Fowler's Solution is subject to deterioration on standing is well known Its alkalinity also has proven to be objectionable in the compounding of many medicines It seems, then, that if the U S P formula could be modified so that the alkalinity would be reduced without causing more rapid decomposition, a more desirable product would result Since moldy growths often develop in the Solution, the addition of a suitable preservative would also serve to improve it

The formula of Fowler s Solution as given in the U S P X is as follows

Arsenic Trioxide	10 Gm
Potassium Bicarbonate	20 Gm
Compound Tincture of Lavender	30 cc
Distilled Water, a sufficient quantity to make	
	1000 cc

* Teaching Fellow College of Pharmacy University of Washington, Seattle

Each hundred cubic centimeters must contain the equivalent of not less than 0 975 Gm and not more than 1 025 Gm of As_2O_3

A résumé of the formulas adopted by foreign pharmacopœias is of interest Chart I represents a comparative study of the principal ones A study of this chart shows (1) that in addition to potassium bicarbonate, the hydroxide and carbonate of potassium are also used, (2) that the majority are more or less alcoholic and (3) that the final products are in some cases nearly neutral, while in others, are alkaline to varying degrees

E M Smelt[1] reports an investigation of the keeping properties of the solution adopted by the British Pharmacopœia The latter solution is of particular interest, in that it is almost neutral in reaction His findings are that (1) the addition of preservatives or the proper adjustment of p_H inhibits the growth of molds, (2) the depositing of crystals can be controlled by increasing the alkalinity or acidity, and (3) the use of sodium hydroxide instead of potassium hydroxide encourages rather than prevents the growth of molds

Although much work has been done on all of these solutions, their diversity in formulas indicates that a product satisfactory in all respects has not yet been attained

CHART I

Abbreviation p = parts

EXPERIMENTAL

In view of the probability that some of the alkali is consumed by the tinctures and spirits commonly added to flavor, color or preserve the solution, it was decided to eliminate such agents, substituting for them alcohol or glycerin, both of which should exert a preservative action Further, since the bicarbonate, hydroxide and carbonate of potassium have all been used, a comparison of the stabilities of solutions made with each seemed worth while

Accordingly, twelve solutions were prepared containing varying amounts of the above-named agents In all cases, the alkali content was reduced below that

[1] E M Smelt, *Quart J Pharm Pharmacol* 6 (1933), 375

officially specified U S P materials were used throughout, the sample of arsenic trioxide available assaying 99 5%, undried The solutions, excepting one, were stored in corked bottles of white glass, not completely filled, since this would best duplicate ordinary dispensary conditions In order to ascertain the effect of storage in well-filled, glass-stoppered bottles, the twelfth was stored in this manner

The solutions were assayed immediately after preparation and subsequently at ten-day intervals, according to the U S P procedure A commercial sample which had been carefully stored for an indefinite period in the original corked bottle of amber glass was also assayed to determine, if possible, just how far the decomposition would proceed The latter solution was the product of a reputable manufacturer and was labeled U S P

CHART II —FORMULAS USED IN PREPARING THE TWELVE SOLUTIONS

The formulas of the twelve solutions are summarized by Chart II Equivalent quantities of the alkali salts were used taking into account the purity rubric as stated in the U S P, as follows

	K_2CO_3	$KHCO_3$	KOH
Molecular weights	138 21	100 11	56 11
Equivalent weights	138 21	200 22	112 22
Assumed amount of water present	15%	negligible	15%
Corrected equivalent weights	162 6	200 22	132 0

Chart III tabulates the results of the assays together with the loss in trivalent arsenic content in solution Within the first ten day period sedimentation was noted in the two solutions containing no alkali Whereas the sedimentation was marked in these two solutions over the total period of observation, the amount shown by all of the others was negligible The commercial product had a crystalline deposit as well as a small amount of gelatinous residue None had an unpleasant odor

DISCUSSION

The twelve solutions may be divided into two groups according to the total loss of trivalent arsenic within sixty days, as follows

Group I

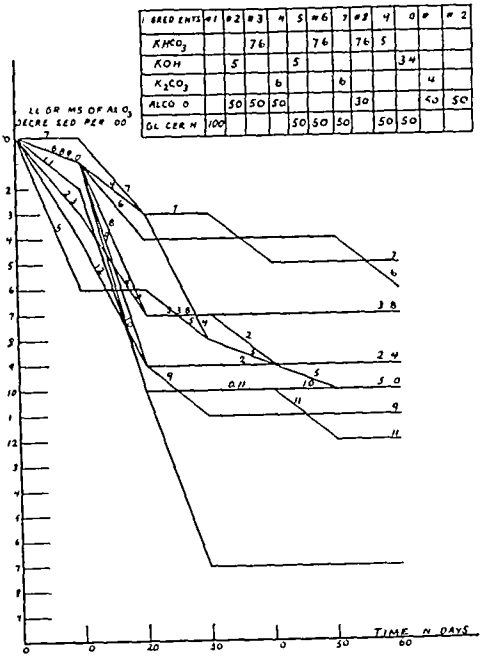
Solution 3—7 mg decrease As_2O_3 per 100 cc
Solution 6—6 mg decrease As_2O_3 per 100 cc
Solution 7—5 mg decrease As_2O_3 per 100 cc
Solution 8—7 mg decrease AsO_3 per 100 cc

Group II

Solution 1—17 mg decrease As_2O_3 per 100 cc
Solution 2— 9 mg decrease As_2O_3 per 100 cc
Solution 4— 9 mg decrease As_2O_3 per 100 cc
Solution 5—10 mg decrease As_2O_3 per 100 cc
Solution 9—11 mg decrease As_2O_3 per 100 cc
Solution 10—10 mg decrease As_2O_3 per 100 cc
Solution 11—12 mg decrease As_2O_3 per 100 cc
Solution 12— 9 mg decrease As_2O_3 per 100 cc

The average decrease in Group I was 6 25 mg , whereas in Group II it was 10 87 mg The conclusion can be drawn here that the solutions of which Group I consists demonstrated the greatest stability over a period of sixty days We find that potassium bicarbonate had been used in the preparation of three of the four solutions in this Group The only other one containing potassium bicarbonate (No 9) showed a total decrease of 11 mg , but inas much as the quantity used had been reduced to a greater extent in this solution, it would indicate that there must be a minimum amount of the salt required to furnish this stability Solution No 7, containing potas sium carbonate and five per cent glycerin, also stood up very well

CHART IV



In the solutions in which potassium hydroxide had been used (2, 5, 10), there was an average decrease of 9 6 mg showing it to be much less efficient than potassium bi carbonate The other two solutions in which potassium carbonate was used (4, 11) showed an average loss of 10 5 mg It is interesting to note that the stable solution using potas sium carbonate contained glycerin while the less stable ones were alcoholic All solutions containing the lesser amounts of alkali or no alkali at all proved to be comparatively less stable

Solution No 12 which had been stored in a well filled, glass stoppered bottle showed a total loss of only 9 mg in 40 days having exhibited no more decrease after 20 days This mode of preservation apparently retarded its rate of decomposition, since it contained no alkali

Very little can be said concerning the advantages of alcohol or glycerin over each other, except as previously mentioned in the case of the solutions made with potassium carbonate The fact is, however, that none of the solutions showed any visible traces of moldy growths, indicating

at this point, that either will function well as a preservative, providing 60 days is sufficient time for the development of a mold

The commercial sample assayed 17 mg of arsenic trioxide below the minimal amount allowed per hundred cubic centimeters by the U S P It had a rather marked sedimentation, partly crystalline and partly gelatinous As stated before, its age was indefinite but its analysis gives us an idea of just how much deterioration can be ultimately expected using the U S P formula Only one of the solutions here prepared fell below the U S P requirement the latter being Solution No 1 which contained no alkali at all

Chart IV compares not only the decreases in strengths, but also the decrease rates It will be noted that the rate is rather great at first, after which a point of equilibrium seems to be reached The amount of air space in the bottle is probably a factor strongly influencing this initial drop A further study of this Chart reveals the following points Solutions Nos 3, 8, 10, 12 all show no deterioration after 20 days, Nos 9 1 none after 30 days, Nos 2, 4 7 none after 40 days, and Nos 5, 11 none after 50 days No 6 apparently has not yet reached a point of equilibrium

CONCLUSIONS

(1) Using equivalent quantities of potassium bicarbonate, potassium carbonate or potassium hydroxide in lesser amounts than indicated in the U S P, solutions may be prepared which do not fall below the official strength within a sixty-day period

(2) The bicarbonate appears to be the most efficient of these three potassium salts in so far as stability of the product is concerned

(3) The percentage of potassium bicarbonate may be advantageously reduced from the present 2 per cent to around 0 76 per cent, a decrease of over 60 per cent

(4) In place of the 3 per cent of Compound Tincture of Lavender now used, about 5 per cent of alcohol or glycerin may be substituted, again providing no mold will appear after 60 days

(5) Dispensers should be urged to make use of small bottles, well-filled and tightly stoppered, for storage purposes This work is being continued

ADDENDUM

Fowler s Solution has been retained in the U S P XI, but it is to be a colorless and flavorless solution Apparently the Compound Tincture of Lavender was objectionable That the alcohol present served a useful purpose has been suggested by various writers

Mr Schwartz was asked to conduct a series of time experiments, the results to date being herewith presented

It is worth while noting that only one of the solutions has deteriorated below the U S P minimum requirement The suggestions offered in previous reports that the extractive in the Compound Tincture of Lavender stimulated oxidation of the trivalent arsenic may be substantiated by Mr Schwartz's report if the solutions have reached a point of equilibrium, and will display no further deterioration The selection of the alkali to be used and the quantity to be used will become a pharmaceutical problem The problem of incompatibility will be a major one — H A Langenhan

AN INTERESTING COLLECTION OF MORTARS *

BY CHARLES H. AND MILLICENT R. LAWALL

Where and when did the mortar and pestle originate as a pharmaceutical utensil? Dictionaries digress in their definitions and encyclopedias entirely omit the subject or dismiss it in a few lines. It seems to be a forgotten or neglected subject, and yet from the crude woodcuts of the early incunabula to the literature of the 19th and 20th centuries, we find the mortar and pestle symbolic of pharmacy. We find actual examples of Arabian and even of Roman mortars but beyond them there lies an impenetrable mystery. We have found no reference to the mortar and pestle in the more ancient Egyptian pictorial writing nor even reference to these implements in the catalog of the British Museum. The translators of the Ebers Papyrus, which gives hundreds of formulas for dozens of kinds of pharmaceutical preparations makes no mention of the mortar and pestle, although they use the terms "casserole," "jug," "hennu-vessel" and "flask" to denote the kinds of apparatus directed.

Many formulas in the Ebers Papyrus call for pills and suppositories, and as the directions to crush or pound are frequently found, it may be that they employed the mortar and pestle, if this is so the fact has been carefully concealed. We know that mortar and pestle-like implements of stone and wood were used by primitive races in both the old and the new worlds for grinding cereals into coarse meal, but we cannot trace the connecting link between this household use and their employment in pharmacy.

When we come to Roman times and customs we find the mortar and pestle in a very advanced form. Whence did it come? Probably not from the Orient, at least not from China, for the Chinese grinding device corresponding to our mortar is still in the form of a boat shaped trough in which a sharpened iron disc is rolled back and forth. Probably the popularity of the electuary and of the medicated fruit pastes called confections gave rise to a need that was quickly filled. Roman mortars have come down to us of marble, earthenware, stone, wood and bronze. The shapes are very much like the mortars of later times. One form of Roman mortar seems to have entirely disappeared, however, from practical use in later times, and is found only as a museum piece. It is the quern or metal mortar with a tightly fitting metal lid which had a hole in the top through which the handle of the pestle could pass. There were earthenware, stone and marble mortars, too, which were mainly employed in the kitchens of the Roman households. This culinary use of the mortar continued down to late Colonial times in America, the metal mortars being used for contusing spices, while the marble mortars were used for making almond paste and similar soft mixtures. The Arabs and Persians used the mortar in pharmacy, probably having learned its use from the Romans. It is toward the close of the medieval period and throughout the Renaissance that we meet the copper, bronze, brass and iron mortars in greatest numbers. The esteem in which mortars were held in pharmacy, and the important position which they occupied is attested by the fact that many of them were inscribed with the date of the origin and

* Section on Historical Pharmacy, Madison meeting, 1933

frequently with the name of the owner and sometimes of the metal worker who made the mortar

Perhaps the introduction of gunpowder into warfare had something to do with the rapid influx of metal mortars, for we learn that the mortars were frequently cast in gun foundries in the 15th and 16th centuries We learn also that bell foundries frequently cast mortars Here were two sources of mortars—diverse and antagonistic It is interesting, too, to note that there was a period covering several centuries when a religious motif seemed to dominate certain phases of pharmacy and medicine It is during this period that we meet with mortars bearing religious mottoes and precepts, such as "Lof Got von all" (Praise God above all) on Flemish mortars, 'En Dieu est mon espoir" (In God is my hope) on French mortars and similar phrases on mortars cast in other lands

The word "mortar" is derived from the Latin word *mortarium*, which is said to have come from the root word "*mordeo*," to bite (which also gives us the word ' morsel") This in turn, may have come from the Sanskrit word "*mrdi* ' meaning to grind or to pound, and which is also used to denote the implement or vessel in which the pounding or contusion may be accomplished

Plato makes mention of the mortar in his writings but whether as a culinary or pharmaceutical utensil, we are not sure Juvenal specifically makes mention of the mortar as an instrument used in the trituration of drugs Pliny also refers to it

The oldest English reference to the mortar in the New Oxford Dictionary, of Murray, is in a Saxon Leech book of about 1000 A D , in which the word is spelled "*morterc* " When we arrive at Elizabethan times we find a contemporary writer commenting at some length on the particular uses to which mortars of different kinds were to be put "Of morters likewise they ought to have divers sorts for all precious stones (that enter into electuaries) and corall ought not to be beaten in a brazen morter, but pearls and corall ought to be beaten in a morter of white marble, precious stones must be made or grinded into pouder upon a stone called in Latine, Lapis Porphirius, which is a kind of red marble Also purgations or electuaries, pills or powders mingled with syrups ought not to be dissolved in brazen morters, but in morters of glasse, of stone or of fine wood, yea, and if they were of silver for great men of high degree, it were best Also some ointments ought to be made in morters of lead "

There is a vessel akin to the mortar and pestle found in South America, called the "*metate*" which consists of a concave stone surface, over which a stone roller, tapering toward both ends is rolled This type of grinding device has also been found in the ruins of the circular huts of the original Britons in North Wales

The Romans had special manufactories for *mortaria* in Britain, from which the wares were exported to Rome and Gaul

The collection of mortars which we are about to describe is at the Philadelphia College of Pharmacy and Science and includes specimens of many types of mortars of various periods and countries, some of them having interesting individual histories as well Let us proceed to discuss them in the order of the accompanying illustrations

No 1*a* and No 1*b* are examples of stone mortars and pestles of American Indian origin The one on the left is very crude, being simply a piece of sandstone, irregular in shape, very crudely hollowed out, the hollow being very shallow The

pestle is a crudely formed piece of similar sandstone The specimen on the right is made from a large pebble, obviously water washed, the hollowed out portion is very regular in shape, and the pestle, which is of a finer grained stone, is well shaped and fits the concavity as well as the average pharmaceutical mortar and pestle fit each other Unfortunately, the geographic locality from which these specimens came is unknown

Figure 2*a* is an example of a lignum vitæ mortar and pestle, machine turned and polished It is about 7 inches tall and about 5 inches in average diameter It is 18th century English

Figure 2*b* is an example of a wooden mortar and pestle, which is reputed to

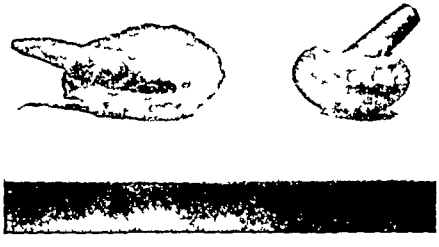


Fig 1 *a*—Crude stone mortar of American Indian origin *b*—Stone mortar of American Indian origin

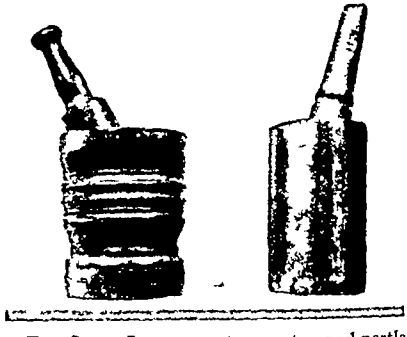

Fig 2 *a*—Lignum vitæ mortar and pestle of English or Colonial origin *b*—Crude wooden mortar of American Indian origin

Fig 3 —Chinese substitute for the mortar and pestle

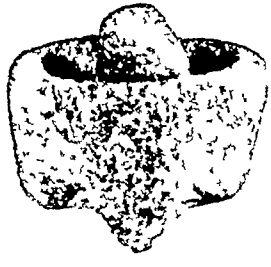

Fig 4 —Stone mortar and pestle from Mexico

have been made and used by a tribe of Shinnecock Indians, whose camp was on Long Island in Colonial days The mortar is crudely formed from a small section of tree trunk of hard wood, and the pestle of hard wood of a different variety

Figure 3 illustrates the Chinese substitute for the mortar and pestle As a contusing and a cutting device, it is excellent, but for triturating it leaves much to be desired

Figure 4 shows a small mortar and pestle of Mexican native origin It is made of very coarse and very hard volcanic rock and is undoubtedly intended for household

purposes probably for grinding the red peppers of which the Mexicans are so very fond

Figure 5 is a very interesting example of a Syrian mortar and pestle, such as is used in Syrian and Arabian households for contusing coffee Coffee is an indispensable adjunct to hospitality in the near East It is served not only at the close of a meal, but also when men meet on business occasions To leave before coffee is served is considered an insult The coffee is always freshly ground in a wooden mortar of this sort, with a very long wooden pestle Both mortar and pestle are beautifully decorated by wood carving inlaid with light colored pigment A shallow-bowled brass spoon for removing the coffee from the rather shallow and narrow hollow in the mortar, is attached to the mortar by a brass chain In this particular specimen the Arabic inscription on the spoon is of more than passing interest Translated, it reads "Made by planter Abi Kovzaza, May 27, 1327 "

Figure 6 is an example of a mortar carved from alabaster, which is a fine-grained form of calcium sulphate It is in an unfinished condition, and is probably intended for ornamental purposes rather than practical use

Figure 7*a* is an example of a marble mortar of the Colonial household type, dating from the 18th century Its companion, 7*b* is a smaller mortar of the same style These marble mortars are sometimes found of a very large size, large specimens occasionally weighing more than 100 lbs

Figure 8 is an illustration of a Chinese mortar and pestle made of porphyry It is of a very unusual shape, being oval, about ten inches long and nearly four inches high Both mortar and pestle are of a brownish pink color and beautifully polished No definite date can be assigned to this mortar, but it is probably very old The mortar and pestle are probably made from different lots of porphyry, as the grain and color of the two pieces are slightly different

Figure 9 is a bronze pestle, very much corroded, which was found among some Roman relics unearthed in a street in Liverpool, England, some years ago It is probably the oldest specimen in the collection, but its shape is identical with that of pestles made nearly two thousand years later

Figure 10 is an unusual specimen of a mortar and pestle of solid ivory, beautifully turned and polished, and is said to be of Spanish origin, and to date from the 16th century It was probably used as a "cosmetic" mortar

Figure 11 shows two very interesting specimens, both of Arabic origin That on the left came from a collection of mortars once owned by Enrico Caruso, the great tenor It bears the following inscription in Arabic "Made by Mohammed Kaghen 1570, and presented to Mohammed Bafr " This mortar is of iron or steel Its companion (*b*) on the left is of copper, with a long-handled, flat-headed copper pestle, both mortar and pestle are very much corroded This specimen is said to have been found in a well at Damascus, and dates from the period of the Crusades, or even earlier It is equipped with a ring handle, the ring being frequently found on Arabic or Moorish mortars, furnishing a convenient method of carrying the mortar, when traveling by caravan

Figure 12 is that of a bronze Arabic mortar, with very fine decorative tooling and an inscription in Arabic, which reads as follows when translated "The owner of blessedness and gifts, Abbas Odesansen, member of Almic Usac, 1226 " There is also on another part of the mortar, the name of a woman—"Sahi Bet Ali," who was

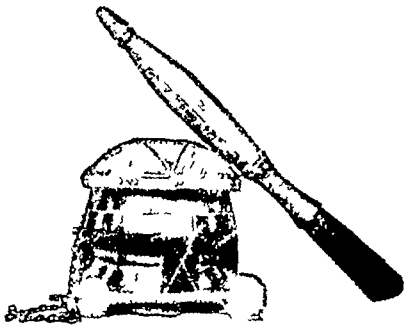

Fig 5 —Syrian coffee mortar dating from the 14th century

Fig 6 —An alabaster mortar and pestle unfinished

Fig 8 —A Chinese mortar and pestle of pink porphyry

Fig 7, *a*—A marble mortar of the Colonial" household type *b*—A marble mortar of the Colonial" household type

Fig 9 —A bronze pestle of Roman origin discovered in England

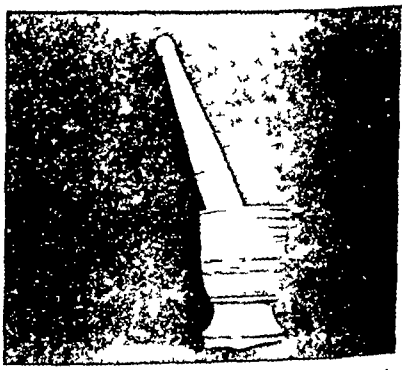

Fig 10 —A carved ivory mortar and pestle of Spanish origin

probably the original owner It was purchased by a collector who brought it from Palestine

Figure 13 is an illustration of a bronze mortar, with very fine inlaid decorations in a lighter colored metal The shape of the mortar is very unusual The inscription appeared to be in Arabic, but proved to be neither Arabic, Turkish, Syrian or Persian The inscription was outlined in white pigment and photographed, and

the photograph sent to Constantinople, where it was deciphered The report on it was as follows "The inscription is in the dialect of a certain Persian sect of fire worshipers (Alevy), and the translation is 'A mill made of a thousand stones' No definite date can be assigned to this mortar, but it is probably very old An expert who saw this mortar says that it is certainly of an origin not later than the 13th century, and may be much older "

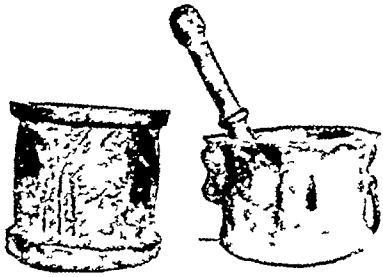

Fig 11, *a*—A 16th century Arabic mortar once owned by Caruso *b*—A bronze Arabic mortar and pestle dating from the time of the Crusades

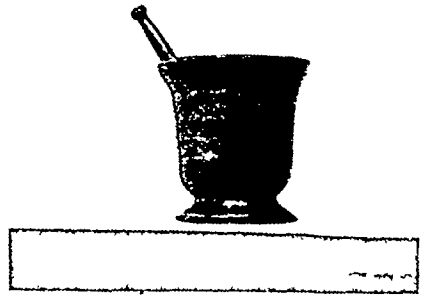

Fig 12 —A bronze mortar from Palestine with an Arabic inscription Dated 1226

Fig 13 —Bronze Persian mortar, with in laid inscription Probably not later than the 13th century

Fig 14 —Ornamental mortar made of an thracite coal

Figure 14 is an ornamental mortar made of anthracite coal, highly polished

Figure 15*a* is an illustration of a bronze mortar of the late 18th century of either Russian or Polish origin

Figure 15*b* is an early American bronze mortar and pestle Figure 15*c* is a brass mortar and pestle of German origin, probably 18th century

Figures 16*a* and 16*b* are both 17th century Spanish mortars

There are a number of Spanish mortars in the collection, most of them beautifully decorated The Spanish mortars are distinctive in their being shallow and having vertical ribs or decorative ridges, and in the absence of handles, except in a few instances where ring handles are found Figure 17*a* is a bronze mortar and pestle of Russian origin, probably dating from the 18th century Figure 17*b* is that

of a beautifully decorated Italian mortar, the unsymmetrical location and size of the handles is noteworthy in this specimen

Figure 18*a* is a bronze mortar from Toul, France, dating from the 16th century,

Fig 15 *a*—An 18th century bronze Russian or Polish mortar *b*—An 18th century bronze American mortar *c*—An 18th century brass German mortar

Fig 16 *a*—A 17th century bronze Spanish mortar *b*—A 17th century bronze Spanish mortar

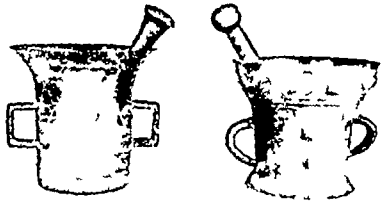

Fig 17, *a*—An 18th century bronze Russian mortar *b*—A bronze Italian mortar probably 17th century

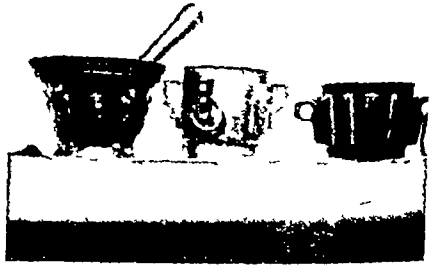

Fig 18 *a*—Bronze mortar and pestle from Toul France, 16th century *b*—Brass Persian mortar with ring handle 14th century *c*—Bronze Spanish mortar 17th century

Fig 19—Brass mortar with dolphin handles and T-handled pestle, dated 1689

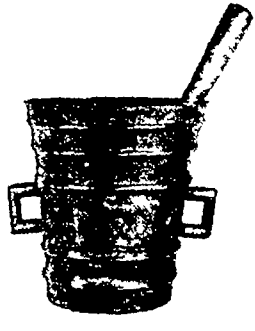

Fig 20—Iron mortar and pestle with square handles, dated 1726

Fig 18*b* is a rare type of Persian mortar of brass, distinctively and handsomely etched, with the ring handles usually characteristic of mortars of Arabic origin It is said to date from the 14th century Figure 18*c* is that of a very early Spanish mortar showing the typical vertical ridges, and the Moorish influence in the ring handles

Figure 19 is that of a brass mortar with dolphin handles, bearing the initials "I B B Z," and the date 1689 It was brought from Switzerland some years ago The T shape of the pestle handle is unusual in this specimen Figure 20 is that of

Fig 21—Wedgwood mortar and pestle, used in store of Christopher Marshall Philadelphia, before the Revolutionary War

Fig 22—Iron mortar, 1784, formerly used in the pharmacy of Frederick Brown, Philadelphia

Fig 23, *a*—Dutch bronze mortar with dolphin handles, dated 1638 *b*—Dutch bronze mortar with dolphin handles, dated 1607

Fig 24—Dutch bronze mortar without handles Dated 1638

an iron mortar and pestle, with square handles, bearing the date 1726 This is either of Russian or Polish origin Figure 21 is an illustration of a wedgewood mortar and pestle, which was used in the store of Christopher Marshall in Philadelphia, before the time of the Revolutionary War

Figure 22 is an illustration of an iron mortar and pestle, bearing the date 1784 painted on the side It came from the pharmacy of Frederick Brown which was originally located at Fifth and Chestnut Sts in Philadelphia Frederick Brown was one of the founders of the Philadelphia College of Pharmacy and Science, and was

originally an apprentice in the store of Charles Marshall, the first president of the College, and the son of Christopher Marshall just referred to

Figures 23*a* and 23*b* are of two bronze mortars of 17th century Dutch origin They were cast by the same workman or foundry, for 23*a* bears the inscription "Henryk Horst me Fecyt, Ao1638," while 23*b* bears in the inscription "Heinrick ter Horst me fecit, Anno 1607 " Both mortars are elaborately decorated and have handles in the form of dolphins Figure 24 is a third mortar coming from this same foundry It bears a similar inscription with the date 1638, but unlike the two previous specimens it has no handles

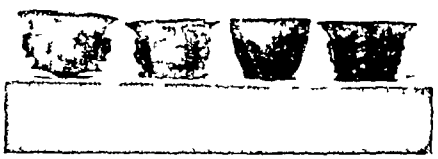

Fig 25, *a*—A 17th century bronze Spanish mortar *b*—A 17th century bronze Spanish mortar *c*—An early American mortar of unusual shape *d*—A 17th century bronze Spanish mortar

Fig 26, *a*—A cylindrical iron mortar with molded decorations originally in the Neergaard Pharmacy, New York *b*—A graceful urn shaped iron mortar from the Neergaard Pharmacy New York

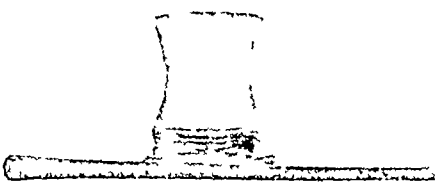

Fig 27 —Large iron mortar with unusually long pestle Early American with an interesting Philadelphia history

Fig 28 —Large bronze mortar bearing date 1733 with reversible pestle

Figures 25*a*, 25*b* and 25*c* are bronze mortars of the 17th century of Spanish origin Specimen *a* has the letter M repeated four times in the decorations The bottom of this mortar had evidently been worn through, for it has a new bottom riveted in place Figure 25*c* is an iron mortar probably of American origin Figure 26*a* and 26*b* are examples of early American iron mortars, *a* has a decorative design which is unusual on iron mortars, *b* is of a graceful urn-like shape, distinctive of mortars made in Colonial America Both of these originally came from the Neer

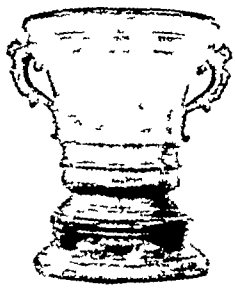

Fig 29 —Very large bronze mortar finely decorated dated 1704

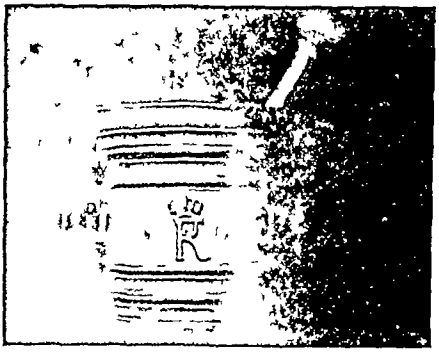
gaard Pharmacy in New York, now owned by Mr David Costelo, to whom the College is indebted for the majority of the mortars described in this article

Figure 27 is also that of an early American iron mortar of unusual shape and with a pestle of unusual length, the mortar being but 11½ inches high This mortar is known to have been used by the following apprentices and clerks in the pharmacy located at Third and Poplar Sts , Philadelphia G W Bley, 1840, John Bley, 1844, Alex Bachman, 1848, Samuel Gerhard, 1849, Jacob H Smith, 1853, Valentine H Smith, 1853, Emil Herwig, 1854 During this period the proprietor of the pharmacy was George K Smith In 1856 the mortar was in the possession of John Ziegler, wholesale and retail druggist at Second and Green Sts , Philadelphia In this same year Ziegler became associated with Valentine H Smith, the firm name being Ziegler and Smith In 1865 the firm name was changed to Valentine H Smith & Co , and from that year until 1929, when this firm was merged with Smith, Kline and French Co , a number of well-known pharmacists in Philadelphia took their turns in using this mortar and pestle during their respective apprenticeships Among these were Walter V Smith, late president of the Smith, Kline and French Co , and Howard E Smith, and Henry S Godshall of the same Company No 28 is a handsome bronze mortar bearing the inscription "Soli Deo Gloria, Amsterdam A° 1733 "

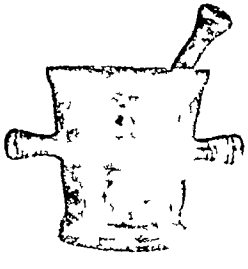
No 29 is a very large mortar, weighing nearly 150 pounds It is very grace-

Fig 30 —Finely decorated bronze mortar with seated lions on handles and bearing the coat of arms of the Medici

ful in shape and is elaborately decorated The handles are in the form of winged angels It is covered with elaborate scroll work, consisting of wreaths and angel heads It bears the following inscription "Filii Francisi de forinis pharmacis parandis fundendum curarunt A S MDCCIV" This mortar was donated by Mr Horatio N Fraser of New York No 30 is a very unusual specimen, also donated by Mr Fraser It is of bronze with a glossy black patina The handles are unlike those usually seen, being horizontal supports for seated lions The design is that of a heraldic shield with a cherub on each side jointly holding a wreath over



Figs 31 and 32 —Obverse and reverse of large brass mortar formerly owned by Frederick the Great



Figs 33 and 34 —Obverse and reverse of bronze mortar elaborately decorated, formerly owned by Napoleon's pharmacist

the center The coat of arms is that of one of the numerous branches of the Medici family

Figures 31 and 32 are the obverse and reverse of a large brass mortar and pestle which was once the property of Frederick the Great, or used in his imperial pharmacy The front bears the imperial monogram of "Friederich Rex," surmounted by a crown The opposite side bears the date 1767, and the stamped inscription "K No 1" which was probably an inventory number This mortar has an interesting history During the World War the German government seized all brass for use in making munitions A collection of mortars was seized just prior to the close of the war Shortly after the war a large lot of all kinds of brass ornaments and untensils was offered for sale in New York, including some very fine

mortars, and among them was this one, which was purchased by David Costelo of New York

Figures 33 and 34 are the obverse and reverse views of a veritable museum piece It is a bronze or bell-metal mortar and pestle which belonged to one of Napoleon s apothecaries The inscription around the top is as follows "A Besançon-Beillemand-Pharmacien-Drogiste" Below this are laurel wreaths and imperial eagles Below these is the name "Napoleon Empereur" Further below this are more laurel wreaths and robed figures There is a double-ended pestle bearing the date "Anno 1802" elaborately engraved in bas-relief

This mortar was at one time in the Rodman Wanamaker collection of Napoleana The donors of the specimens just described are as follows No 4, Wm L Cliffe, '84, vice-president of the College Nos 7*a* and 7*b*, former president, Howard B French, '70 No 9, Joseph P Remington, '66, one of America's pharmacists, and former dean of the Philadelphia College of Pharmacy and Science No 14, Ellerslie W Davis, '16 No 20, George B Evans, '80, former member of the Board of Trustees of the College No 27, Walter V Smith, '87, former member of the Board of Trustees of the College No 28, Horace B Taylor, '57 Nos 29 and 30, Horatio N Fraser, '72, former member of the Board of Trustees Specimens 2*a*, 2*b*, 5, 6, 8, 10, 12, 13, 15, 15*a*, *b* and *c*, 16*a* and *b*, 17*a* and *b*, 18*a*, *b* and *c*, 23*a* and *b*, 25*a*, *b*, *c* and *d*, 26*a* and *b*, 31–32, 33–34, were all donated by David Costelo, '79, of the Neergaard Pharmacy of New York There are not many large collections of mortars in the United States, the largest collection at present being the one owned by E R Squibb & Sons There is no collection to our knowledge, however, which possesses so many diversified, interesting and valuable mortars as the one we have herein attempted to describe

---

ABSTRACTS OF PAPERS PRESENTED BEFORE SECTION ON PRACTICAL PHARMACY AND DISPENSING, A PH A, WASHINGTON MEETING 1934

The Extemporaneous Preparation of Intravenous Solutions Saline and Dextrose," by Robert S Fuqua

The paper submitted attempts to outline simple procedures for the preparation of satisfactory intravenous solutions containing such substances as Sodium Chloride Sodium Citrate and Dextrose

Beginning with the distilled water required, and emphasizing the necessity for purity of, and absence of bacterial contamination in this solvent, the relatively simple matter of making solutions considered and then stress the importance of proper filtration to insure freedom from mechanical impurities—especially filter paper shreds

The thought in mind is to outline both the usual pharmaceutic procedure of preparing simple solutions, with filter paper being used as the filtering medium and also a hospital method for preparing buffered solutions in small lots using the Berkefeld candle type filters to clean

Sterilization and the temporary preservation of sterile solutions, are discussed briefly The need for having such solutions as nearly neutral as possible is noted, and attention is directed to factors which affect the values of same adversely

A Note on the Assay of Reduced Iron by Margarethe Oakley and John C Krantz Jr

A comparison of the mercuric chloride and copper sulphate methods for the determination of reduced iron has been studied

---

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS DEPARTMENT

Editor's Note Shall the pharmacist go after the dental prescriptions? By all means The following paper by Professor Schicks tells how it may be done and also tells how we may prepare our students to serve the dental profession It is worthy of careful perusal by all faculties of colleges of pharmacy —C B JORDAN, *Editor*

SHALL COLLEGES OF PHARMACY TEACH DENTAL PHARMACY?

BY GEORGE C SCHICKS *

The extension of the time period and the enlargement of the scope of course content in the present-day training of the student of Pharmacy stands as mute evidence of what has been uppermost in the minds of pharmaceutical educators College courses have not been lengthened from two years to four nor course subjects doubled that the graduate in pharmacy might say, "I have attended college four years," nor has this change come about for the purpose of increasing the prestige of the profession of pharmacy

No one will question the fact that professional prestige follows close upon increased training, a firmer scientific background and a greater adaptability in fields closely allied with pharmacy But pharmaceutical educators have not thought first of professional prestige Colleges of pharmacy have been scientific pioneers in professional usefulness To such an end have their faculties shaped courses to widen the scope of the professional activities of their graduates Professional usefulness must be the key-note of every pharmacy curriculum Professional usefulness must be the pattern from which every basic scholastic activity of a college is fashioned Professional usefulness must be first, last and uppermost in the minds of educators in our colleges, it must be—nothing else can be substituted, for professional usefulness is the salvation of Pharmacy

It is fast becoming a reality that the man in pharmacy who can divorce himself most completely from the soda fountain, the cigar case, the cosmetic counter and the sandwich grill, is the man who has narrowed his competition to the minimum May I say again—he alone among the keepers of shops is licensed by law to compound prescriptions That has been the key-note of his training and his professional prestige will increase with his professional usefulness

Each year splendid groups of fine young men and women leave our colleges of pharmacy—young people whose eyes have seen scientific wonders under microscopes, whose fingers have held tubes while scientific miracles have gone on within those glass containers, whose hands have stained slide after slide, that those eyes might behold the giants of disease which stalk among men Are those young people going to give up their test-tubes and mortars and microscopes to make sodas or ham sandwiches?

Of course, they aren't Those young people have caught the spirit of science. The spirit of science has captured them They are the products of our colleges

* Rutgers University

in the minds of whose faculties has been uppermost the ideal of professional usefulness

It is this ideal of professional usefulness which is prompting me, a teacher in a college of pharmacy, to urge the association of colleges to emphasize the subject of dental pharmacy Colleges are the scientific pioneers for professional usefulness and dentistry represents a large field for the prescription pharmacist

There are some very definite reasons why dental pharmacy provides a fertile field for professional activity Uppermost, perhaps, is the earnest desire of the dentists of this country to learn more about official drugs and preparations and the prescribing of them Their enthusiasm and cooperation have been more marked than one dared even believe they could be Here is a field where professional pharmaceutical usefulness is welcomed In the few years that I have been engaged in this work, more than a thousand practicing dentists have given me their names and addresses requesting that they be kept informed regarding recognized and approved drugs and preparations Letters have come unsolicited from outstanding dental educators and officials, encouraging us in our work and assuring us of their cooperation

It has always been the privilege of the pharmacist, authorized by licensure, to serve the medical profession in all of its special branches Dentistry represents the second largest field for prescription writing and therefore widens the scope of professional service

Our student pharmacists need some training with regard to the needs of the dental profession Much professional usefulness would be sacrificed if the service rendered is not an intelligent one

The writing of prescriptions is a comparatively new field for the dentist It must be remembered that the training of most dentists and of many physicians has been lacking in prescription writing Colleges of dentistry recognize this deficiency and are strengthening their courses in Materia Medica and the prescription The student pharmacist should be encouraged to develop an attitude of understanding and helpfulness Ridicule of prescriptions will do much to retard cooperation between the dentist and pharmacist

Some pharmaceutical supply houses have always made prescription writing as easy as possible for all branches of the medical profession These houses are supplying dentists and physicians with prescriptions which in reality amount to nothing but a notation in good legible printing of a substance to be purchased at a drug counter, the patient to follow either the directions given on the bottle or package or those printed on the prescription Such a practice robs the dentist of individuality in his prescriptions, encourages self-medication and discourages the use of any products other than the packaged type

It would seem, then, that the student pharmacist should be thoroughly trained in Latin prescription writing College courses in prescription writing should be so strengthened to assure adequate training An accurate and brief method of writing prescriptions should be so outlined to the student that he could make helpful suggestions to the dentist when discussing prescription problems with him

Charters, in his "Basic Curriculum Materials," mentions "Agents Acting on the Teeth and Gums," and totals them as numbering 121 substances In a small booklet published by the N A R D , entitled "Official Drugs and Preparations

Used in Dentistry," there are listed some 230 drugs and preparations official in the U S P and N F A study of these items will reveal the many opportunities open to the pharmacist to supply these materials to the dental profession At the present time a wide field for professional usefulness is lost to the manufacturers of dental supplies, for they are the only ones who are going after the business It is their salesmen who supply practicing dentists with the information they get regarding the drugs they use in their practice

Dentists in their practice use many of the same drugs and preparations used by the physicians, but unless such facts are pointed out to the student, he may pass them by with no thought as to their dental application The teachers of Pharmacy, Materia Medica and Bacteriology should emphasize such drugs and preparations when they are studied in these courses and point out their special application to dentistry

The questions now arise as to how and where in the pharmacy curriculum should dental drugs and preparations be considered and how much time should be allowed for this work?

It seems that a suitable place for the study of such drugs would be in the lecture and laboratory of Materia Medica or Pharmacology, Dispensing Pharmacy and Bacteriology For instance, when the pharmacology of iodine is being considered, its use in dentistry should be mentioned, stressing the reasons for its use, the preparations commonly used, which may differ some from the U S P and N F formulas but which contain official materials—whether or not it produces a permanent stain on the teeth, how such may be removed and the strength and solvents of iodine preparations used in the mouth, etc Not only the antiseptic and germicidal value in the oral cavity should be considered but also its use in solutions such as a disclosing agent The combination of iodine with other substances such as zinc chloride, potassium iodide, glycerin and water for this purpose should be noted

It may be necessary to add a few new terms to the student's vocabulary, as in the uses of iodine as a "disclosing agent" and antiseptic and counter-irritant in the treatment of pericementitis Attention should be brought to the fact that dentists usually use a weaker solution than the approximate 7% U S P strength tincture Those classes and combination of drugs used more commonly in dentistry, such as abrasives, obtundents, devitalizing agents, varnishes, etc, may be studied at some convenient time during the lecture and laboratory periods

In dispensing pharmacy the student may be required to dilute the U S P tincture of iodine with equal parts of glycerin, making a strength commonly used in dentistry—a strength not likely to cause severe irritation and one more readily uniting with the mouth secretions To increase student technique, such a solution could be placed in glass ampuls—not that this has any special application to dentistry, but it would show how ampuls are filled and focus attention to the 3 5% iodine ampuls in the N F

In the same course, students should compound prescriptions used by dentists in office practice, and those written for patients Characteristic prescriptions may be obtained from the files of local pharmacists and students could be asked to bring in dental prescriptions Stock solutions and preparations which the dentist uses in his own office but does not usually prescribe should be made by the

student For example, Talbot's Iodo-glycerol Solution, scouring powders, colored and flavored, obtundent solutions, digestive solutions or pastes for removing dead pulp or extraneous tissue, varnishes, disclosing refrigerant and counter-irritant solutions The kinds of, and uses, for various abrasives and polishing agents found in tooth powders and pastes, such as precipitated and prepared chalk, tricalcium phosphate, tin oxide, pumice, magnesium carbonate, soap and others, should be referred to and their combinations studied and experimented with

Tooth powders and pastes should be made by the student, using the above substances and others The preparation of tooth-paste base should be given as an experiment The formula for such a base appears in the September 1932, issue of the *Druggists Circular* and the February 1933, issue of the A PH A JOURNAL To this base, medication may be added upon prescription by the dentist A similar experiment could be performed with vehicle mouth rinses

The coloring and flavoring of substances such as sodium perborate should be considered There is little excuse for requiring a patient to take ill-smelling or tasting medicaments There are some substances, the flavoring of which might be experimented with by some especially interested students who are qualified to carry on the work, for instance, the preparation of a palatable solution of copper sulphate or chromic acid

Since the lecture and laboratory work in dental pharmacy is not widely different from that usually studied in most pharmacy courses, a minimum of 10 hours of laboratory and 3 hours of lecture could be used to advantage in dispensing pharmacy In bacteriology, when the antiseptics and germicidal power of certain agents are studied, special reference to dental use could be made The germicidal claims of mouth washes and tooth pastes could be checked and compared, thus giving the student valuable information to discuss with the dentist Attention could be brought to the fact that certain tooth pastes no longer bear the word "antiseptic" on the tube and some manufacturers of mouth washes have changed their dilutions to make claims more nearly true In courses such as Materia Medica and Bacteriology special reference to the dental application of drugs and preparations should be mentioned as the drug is brought up for consideration

Stress should be placed on the rulings of the Council of Dental Therapeutics of the American Dental Association, governing the acceptance of the drugs and preparations analyzed by its laboratory Student pharmacists should be shown the wisdom of encouraging the use of non-secret dental preparations and preparations accepted by the Council

At the present time there is not a publication known as "Accepted Non-Official Dental Remedies," although one is in preparation, and it is therefore necessary to get such information from the *Journal of the American Dental Association* Permission has been granted me by the American Dental Association to publish in a pharmaceutical journal the list of accepted and rejected dental preparations This information, it is believed, will be invaluable to the practicing pharmacist

It will require extra effort on the part of the teacher to compile the necessary information regarding the drugs used in dentistry, as well as the arrangement of the laboratory experiments, but the work will be found most interesting and exceedingly worth while

The following prescriptions may give some idea of the nature of the work

℞	Iodine	3 50 Gm
	Potassium Iodide	1 20 Gm
	Zinc Chloride	1 00 Gm
	Glycerin	25 00 cc
	Distilled Water	25 00 cc

Sig Disclosing solution to be used by dentist

℞	Zinc Chloride	1 00 Gm
	Solution Formaldehyde	0 25 cc
	Menthol	0 25 cc
	Oil of Cinnamon	0 50 cc
	Oil of Clove	0 50 cc
	Alcohol	25 00 cc
	Distilled Water to make	100 00 cc
	Tincture of Cudbear to color	

Sig 4 cc in half glass of water as mouth rinse

℞[1]	Iodine	20 00 Gm
	Phenol	60 00 Gm
	Glycerin	20 00 Gm

Sig To be used by dentist as a caustic

℞[2]	Pepsin	7 50 Gm
	Diluted Hydrochloric Acid	0 50 cc
	Glycerin	7 50 cc
	Alcohol	1 00 cc
	Menthol	0 05 Gm
	Eucalyptol	0 05 cc
	Methyl Salicylate	0 05 cc
	Distilled Water to make	100 00 cc

Sig Digestive solution for extraneous tissue

℞[3]	Camphor	47 5 Gm
	Menthol	47 5 Gm
	Alcohol to make	100 0 Gm

Sig For facial neuralgia

℞[4]	Rosin	20 00 Gm
	Chloroform	100 00 cc

Sig Varnish in dental work

℞	Ethyl Aminobenzoate	10 0 Gm
	Balsam Peru	15 0 Gm
	Glycerin	20 0 Gm

Sig For painful socket

℞	Arsenic Trioxide	Gr LXXX
	Cocaine Hydrochloride	Gr XV

Oil of Clove to make a paste

Sig Devitalizing paste

The college teacher can find many outstanding books which will give him great assistance in outlining his work Such books as the following will be found in valuable

Prinz, 'Dental Materia Medica and Therapeutics" C V Mosby, St Louis

Prinz, "Dental Formulary," C V Mosby St Louis

Buckley, 'Modern Dental Materia Medica, Pharmacology and Therapeutics," Blakiston Philadelphia

Harris, "Dictionary of Dentistry," Blakiston, Philadelphia

Fones, "Mouth Hygiene" Lea and Febiger, Philadelphia

Fisher and Riethmuller "Local Anesthesia in Dentistry," Lea and Febiger Other reference books will be found listed among the dental textbooks of catalogs presented by publishers of scientific books

Rutgers University College of Pharmacy has endeavored to stimulate a national interest in pharmaceutical service to the dental profession Several colleges of pharmacy are now engaged in this important and helpful work The undertaking is too great and the scope too national in character for any one college to undertake I should like to urge the Association of Colleges to foster the opportunity which dental pharmacy offers for increased professional usefulness I should like to ask them to again be pioneers in a field which offers so many possibilities for their graduate students

[1] PHENOL IODATUM N F

[2] LIQUOR PEPSINI ANTISEPTICUS N F

[3] MENTHOL CAMPHORATUM N F

[4] SOLUTIO RESINÆ CHLOROFORMICA N F

NOTE Many dentists use twice the amount of rosin in the same amount of chloroform

THE EIGHTY-SECOND ANNUAL MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, WASHINGTON, D C , MAY 7–11, 1934

ABSTRACTS OF THE MINUTES OF THE GENERAL SESSIONS

Sessions of the Eighty-Second Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION were held in Shoreham Hotel, but it was necessary to hold several of the sessions in Wardman Park Hotel A list of members in attendance may be found on pages 519–521 of the May JOURNAL

Some of the Committee Reports referred to in the Proceedings have been printed in the Council Minutes, pages 504–514 of the May JOURNAL, some are included in these minutes or will be printed in later issues of the JOURNAL under 'Committee Reports" or under Addresses "

FIRST GENERAL SESSION

The First General Session of the Eighty Second Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION was called to order by President R L Swain in the Theatre of Wardman Park Hotel, May 9th at 8 15 P M The following former presidents of the AMERICAN PHARMACEUTICAL ASSOCIATION were in attendance (In order of seniority) James H Beal, E G Eberle, William B Day, Frederick J Wulling, Charles H LaWall, Samuel L Hilton, Julius A Koch, H V Arny C W Holton, L L Walton, Theodore J Bradley, H A B Dunning, H C Christensen Walter D Adams, W Bruce Philip (The Dedication Exercises of the American Institute of Pharmacy are reported in the May JOURNAL, pages 478–490 The annual banquet is reported on pages 490–498 of the same issue)

It was explained that this was a joint meeting with the House of Delegates and that after the presidential address the meeting would be turned over to the Chairman of the House of Delegates

Vice-President Robert P Fischelis presided while President R L Swain read his presidential address which was received with due appreciation by the members present (See Address on pages 438–454 and Resolutions on pages 474–476)

Vice President Robert P Fischelis announced that in accordance with the usual order this comprehensive, splendid address would be referred to the Committee on Resolutions

James H Beal was recognized He commented favorably on the address of President Swain and stated that the ASSOCIATION had been honored by his dedicatory address and that of this evening In making a presentation the speaker stated that one of the projects of great hope in connection with the American Institute of Pharmacy is the museum of Historical Pharmacy He desired the privilege this evening of being not the first but one of the first to present an historic relic, a genuine madstone Back in the sixties and seventies of the last century, a madstone was known as a peculiar mineral substance which when applied to the bite of a mad dog had the magic property of extracting the virus He presented a genuine madstone, not an imitation—there were fraudulent as well as genuine madstones and he has the authentic record of this for one hundred years It comes down to us from four generations of pioneer physicians, practicing in Southwest Georgia and in the wilds of Northwest Florida

This stone has the authentic record of four cures complete cures of the bite of a mad dog He humorously explained the results of the application but maintained that the properties of the madstone are as fully authenticated as that of some alleged remedial agents

This particular substance or magic amulet has been known all over the world for hundreds of years but only in the United States so far as he knew, has it been called a madstone In European and Asiatic countries it has been known as a bezoar He requested Charles H LaWall author of ' Four Thousand Years in Pharmacy " to tell a little of the story of the bezoar The account given by the latter was received with great interest and will be made the subject of a brief historical paper in a later issue of the JOURNAL Professor LaWall concluded by saying that the bezoar is a substance of particular interest in a museum such as is being established by the AMERICAN PHARMACEUTICAL ASSOCIATION

President Swain thanked the donor for the gift and Dr LaWall for his presentation and accepted the bezoar thankfully for the ASSOCIATION Congratulatory greetings conveyed by cablegrams and telegrams were read from the following Dr José Guillermo Diaz Havana, Dr William Mair, Newcastle on Tyne, Harvey J Donnell North Pacific Branch A PH A, Samuel W Fraser Drug Chemical and Allied Trades Section, New York Board of Trade, J J Lynch, Oregon State Pharmaceutical Association, Portland Retail Druggists Association, Louis Ruvin Northern Ohio Druggists Association, David Hooper, London, England, Herbert Skinner, London England Wheeler Sammons Drug Institute of America, Inc , British Pharmaceutical Society (see page 477, May JOURNAL)

The meeting was then adjourned

SECOND GENERAL SESSION

The Second General Session of the AMERICAN PHARMACEUTICAL ASSOCIATION was convened in Shoreham Hotel on Thursday, May 10th at 2 00 P M by President R L Swain A message was received from Honorary Member F Gladstone Hines of London, congratulating the ASSOCIATION and greeting the members

The report of the House of Delegates, covering the first and second sessions was read by Secretary Kelly and approved

Julius Riemenschneider, of Chicago, was recognized by President Swain He presented a London Pharmacopœia of 1673 on behalf of Wheeler Sammons for the Drug Institute of America

President Swain thanked the donor for this evidence of friendship and assured him that the gift would find a permanent place in the American Institute of Pharmacy

The minutes of the First General Session were read and approved

Secretary Kelly referred to a number of congratulatory messages which had been received

Chairman H A B Dunning in speaking for the Headquarters Campaign Committee said he would make no extensive report but summarize what had been done during the past year, many things that might appear in his report are part of the Secretary's report He said in part

'There have been five thousand subscriptions from wholesalers, retailers and manufacturers and students In all there has been collected $507 744 95 All of that money has been spent for the site, the erection of the building the furnishing of the building, the landscaping and the gardening A little bit more than that has been spent A very small sum, $35,000 will cover our deficiency That doesn't mean that we are in any danger or that we have a big mortgage on our institution It is a very small one which you and others will clear off within a very short time, whether you know it or not

'I have told you in my other reports that every state in the Union has subscribed to this project, without exception and some countries besides our own, including England, Canada and Porto Rico You will be interested to know that the retailers with their smaller subscriptions have contributed their full part of this fund The retailers subscription has aggregated $232 203, and they have paid a very large percentage of their promises The manufacturers have subscribed somewhat more, three hundred and one thousand and some odd dollars The wholesalers are yet to do their duty and it is my problem to have them fulfil their obligations Up to this time they have subscribed fifteen thousand dollars

'It is a matter of pride that the little state of Maryland is the second largest subscriber to this fund Naturally New York State is the largest California did very well $13,000, Missouri, $37,000, Ohio, $30,000, Pennsylvania, $33 000 I think it would please some of you to know that the late Dr Utech, by his extraordinary energy and interest, was largely responsible for the substantial amount obtained from Pennsylvania

The building was completed and formally accepted on September 14, 1933 Many of these items that I might bring to your attention are so obvious since you have seen the building and visited it that I won't take time to mention them

'I mentioned in my address of yesterday the transfer of property by the United States Government to us, and the exchange of some which we had to the United States Government Fair exchange is no robbery For your information Constitution Avenue has been widened to eighty feet, or will be widened eventually to eighty feet—it makes our site very much more impressive Twenty-Second and Twenty-Third Streets have been widened up to the building line and

will eventually be widened to a greater degree, and Twenty Second Street will undoubtedly become one of the principal boulevards leading over the new Memorial Bridge, past the Lincoln Memorial through Washington north and south

'I come to the real point of this meeting The real point in this meeting in my mind is to tell the members of the ASSOCIATION and ask for their interest, help and sympathy—that I persuaded the Council to permit me to be Chairman of a new committee to obtain a million dollars as a maintenance fund

I expect to start that effort within the next week or two I shall ask the help of the State chairmen to get whatever they can from the individual pharmacists, but more particularly for them to see those men of greater means in their localities whom I shall write to or get in communication with, one way or the other, either see those men personally, or have some one see them and tell them what this building really means to pharmacy, and to them and to the public

I feel that if men with means could realize the true value of the American Institute of Pharmacy to them, that the men in the pharmaceutical work would realize the work of this institute to them not only professionally, but from a selfish viewpoint there would be no difficulty in obtaining the million dollars which I have in mind Of course, we will take less than a million dollars, but we really should have that amount to provide the necessary funds to carry on the necessary work only the necessary work, that should be done in this institution A million dollars is not much money when you look at it from the viewpoint of interest produced from safe investments, one could not expect to obtain more than thirty-five or forty thousand dollars and half of that from five hundred thousand dollars

The ASSOCIATION should have, to continue its work here with some little expansions, certainly from fifteen to twenty thousand dollars a year That is not a great deal to provide when one realizes the great value of the services that can be given by this institution I do want to impress upon you that this building is more or less self supporting at the present time, but barely can get along

'I have already spoken about the kind of work that is going to be done, that is from my viewpoint, in this institution, it is going to bring about the correlation of the professional work in pharmacy, which will result in saving it from some of the influences that are responsible for the present unsatisfactory conditions in pharmacy I hope to see there a representation of all the professional and ethical bodies I mentioned them by name yesterday, the colleges, law enforcement officers, the U S P workers What use they make of it will be a matter for their respective organizations to define but they should make some use of it

Referring to the material value of the institution when you think that millions of people will pass over the new Memorial Bridge, through this new boulevard right past our fine building, and will become interested in what it represents and many of whom will visit it and find out that it represents pharmacy and then they learn what pharmacy really means as a professional and scientific undertaking, it will create a reaction in the public mind which will reflect beneficially in a material way upon all phases of pharmacy, particularly those who manufacture pharmaceutical products The pharmacists cannot hope to maintain the special privileges and keep the prestige that the professional aspects of the calling give them unless it is justified in some way Some of our pharmaceutical houses spend half a million dollars in propaganda work a year I feel that it would be very low propaganda cost to spend five or ten thousand dollars a year for five or ten years to develop this institution which is so obviously of great material advantage to them

'I want to impress upon you that this building has been built at a phenomenally low cost The reasons for that are several One of them is that it was constructed in the time of depression, and the other one is that all of those who were interested in the project made good bargains not only in purchasing the land but in purchasing the building material I don t think it would be an incorrect statement to say that that building and the land we own which cost us five hundred and some odd thousand dollars couldn t be reproduced right now for less than a million and a half It is worth several million and in a few years it will be worth many millions I hope you don't think my statement is an exaggeration It is the only site left in Washington that would be available for a structure of this kind I am telling you that, not with the idea that we should take any advantage of the opportunity and to make money off the project but it does give one a thrill to feel that a value is represented greater than the cost in something which we own

'Regarding the operation of the building—perhaps some of you might think that this building is too big for the headquarters, or too costly to operate The economy of operation of the building is so low that I doubt if an ordinary 3 story dwelling could be operated on less cost Practically everything is automatic Those automatic materials were bought at low cost, the furnace is automatic, oil burning furnace, watering the lawn is automatic, it didn't cost a great deal to install it but it would have cost a tremendous amount of money to have kept the lawn watered We were obliged to have the lawn, otherwise we wouldn't have the site because we could not have received any cooperation through the Fine Arts Commission and the Parks and Planning Commission if we had not yielded to their desires that the location of the building and its surroundings should be developed in accordance with their wishes There are no elevators no loafers and anything of the kind to eat up the funds which are available

"I wish to impress upon the members of the AMERICAN PHARMACEUTICAL ASSOCIATION that this doesn't happen to be Dr Kelly's building or Hilton's or Swain's or mine, nor does it belong to all four of us I could give many other names, don't get your feelings hurt now because I didn t mention your name We turn it over to all of you We feel that you should take more interest in it than you have I mean more effective interest We all appreciate, and we thank all who have worked and have been active in this work It has not been the four of us it has possibly been a hundred of us all together, and a limited number have borne the principal burden perhaps, and we enjoy and appreciate your congratulations

"I wonder if you don't sometimes forget that after all, you should be congratulating yourselves because it is your property I mean by that, that in the future I hope that many hundreds of you will keep the Institute in mind I hope you are sold on it I hope you *don't* think that it is an impractical kind of a thing that as I said in my address the other day, it is a white elephant on the hands of the AMERICAN PHARMACEUTICAL ASSOCIATION It isn't at all It is its savior in a sense I don t mean that it wouldn t live without the Institute but it comes at a very fortunate time, and it is going to help the AMERICAN PHARMACEUTICAL ASSOCIATION do the work that it needs to do to save pharmacy

' We hope that more of you will begin to think in terms of personal position, and begin to do those things which are needed to be done to consolidate and secure the effort which we have made I don't only mean in obtaining money, but in selling yourselves on the value of the Insti tute and selling other people on its value If you will do that we will get the necessary money, and we must have it

'In line with that thought, I am asking a certain number of gentlemen, and I would be glad to hear from any of you who would wish to speak from the floor to speak your minds, and give us your thought in regard to the building as you see it now You probably have already visited it I am sure that the men that I will call on have seen it I hope you will tell us, or tell the Asso CIATION what you think of the building and its value and its prospects I hope you will tell us what you are going to do to make it fulfil its mission and its opportunity '

Chairman Dunning called on **Secretary E F Kelly**, who spoke in part as follows

' I attempted yesterday to express in a few words at the dedication exercises, my concept of this building and what it could do for this profession in which we are interested I believe the time has come, from my experience when consolidation and mutual interest between groups having the same purpose are absolutely essential I think we have to build some place and there create a force and influence which represents the combined influence of our whole body in any purpose which we have in mind I am one of those who believe fully that, if we wish a position as a public health group and as a public health influence, we have to render the service which goes with that title In other words we pay a price for any position that we occupy

"Furthermore I believe that we have reached a place where cooperation between all public health groups is more essential than it has ever been heretofore I believe that the better practice of medicine is as much to our interest as I believe the better practice of pharmacy is of equal interest to the medical men I believe in turn that all such cooperation is in the interest not only of our profession but in the interest of the industries which support them

' As far as I know there is no profession that hasn't some industrial background You can judge from the Chairman's remarks that it is somewhat necessary at certain times to have money, usually furnished by some industrial effort, but it is a fact that all of these professional industries have to cooperate on mutual bases and to help the whole cause Most important of all

cooperation and mutual interest between all groups concerned with public health will be to the public benefit and well-being which, after all is the prime consideration

' I appreciate very much the references that the Chairman has made to the work that the ASSOCIATION can do in that building Now, it is a fact that we can carry on the routine operations of this ASSOCIATION in the building because fortunately we are tax exempt, which means a great deal It rests with the pharmacists of this country to say how much farther these efforts shall go, and certainly they will have to go further than we have been able to carry them heretofore, if we wish to bring about the program which I have just referred to and which I know every one in this room is just as conscious of as I am

"Several years ago it was my privilege to have something to do with increasing the physical facilities of a certain school of pharmacy, and previous to that I was so fortunate or unfortunate as to build a home, and after each step I said, I will never do it again When I built one home, I decided thereafter to rent, and after I had gotten through with the school I thought I was fed up with building and all efforts of this kind We have just struggled through another great building effort and you have heard our Chairman ask for a chance to go on and do something else I, apparently or the group apparently, never know when to quit, but there is an impellent urge to complete a thing of this kind and put it on the very finest basis possible We can operate that building so inexpensively that no type of advertising in my opinion, no type of propaganda, and I use those words in the proper sense, could do for us what that institution can do, may I give a very brief illustration

'It was my privilege to appear before a very important Government commission about a year ago when several men interested in this project were there Incidental to that discussion I referred to the United States Pharmacopœia and one of the most prominent men present asked me, 'What is the Pharmacopœia?' That didn't shock me particularly, because I had had that question asked many, many times After I had explained the Pharmacopœia and the National Formulary, this man said, 'I want to ask you another question, what does the Government give you for the work?'

'I said Nothing '

' He said 'No, you don't understand me I don't mean for the building and all that, but for such operations as this '

"I said, 'Not a cent '

' He replied 'And yet you say these standards are used in the enforcement of Government laws and regulations?'

" 'Yes '

"Then he said 'That is one of the finest public services I have ever heard of, and I think you people are just foolish not to tell the American people about it and let them know that you do that kind of work '

"We hope in this building to illustrate pharmacy and I believe it is going to do that I have been encouraged to watch people come up close enough to read the inscription on the building, and they say it ought to be more easily read I don't think so, because the closer they get to it the better it is

"I am happy to have given the work I have given to that building Nobody owes me any sympathy at all, because of any work I happen to have put into the cause It is one of the most fundamental things that we could possibly do and I say that, because from every angle it is going to help this industry and this profession

It has been my privilege to serve in almost every division of pharmacy I think I have worked actually in all divisions of pharmacy, possibly with the exception of a wholesale house I am looking forward to that experience before I die I say this just as much from the standpoint of the manufacturer and wholesaler as of the practising pharmacist—that if we don't elevate this profession and this industry with which we have our names and reputations connected nobody is going to do it for us Don't sit around and wait for the United States Government or anybody to promote our cause if we are not worrying about it.

' I will never forget the story of the mother bird who came home and the little birds said We have to move ' and the mother said Why?' 'Well the farmer is going to call in all of his friends to cut the wheat.' The old lady said Well don t worry about that ' A few days later she came home and they said We have to move ' She wanted to know why, 'Well the farmer

came down and expressed a great deal of dissatisfaction with his friends and he is going to have the neighbors help him ' But the mother bird said, 'Well, we won't worry about that' A few days later the little birds said, Mother, the farmer came and said the rest of the country could go to thunder, they are going to cut the wheat themselves ' The old lady said, 'Now it is time to move '

My opinion is that, if we want to improve our calling, we have got to do it for ourselves and I am going to put everything I can into that objective "

Chairman Dunning thanked Secretary Kelly and called on Prof Charles H LaWall for a few words, he said in part

The Headquarters Building, in my opinion, is symbolic of what pharmacy can do, and will do It is a torch to light the way to future things It is a symbol of idealism which I believe can be realized if we put it up to the pharmacists, who must start from new foundations, you might say, on the road toward success We must cast aside some of our misbeliefs, we must start toward new goals, but with the inspiration of the building which we now have we cannot fail in our ultimate purpose

I believe that we can build up a membership of more stable and interested individuals than we have ever had before I believe that we can center certain activities there which have never before been recognized to be in existence, and I look upon it as the home of American Pharmacy for the future "

Chairman Dunning called on R E Lee Williamson who responded in part as follows

' It might be presumption for me to say very much more than has been said about this building both yesterday and to day But there is in me a respect for the emblem of ambition in that building A conception of the idea was made known to me in the very beginning and the thought of the proposed effort made such a tremendous impression upon my imagination and so fired my respect and love for pharmacy that from that day until yesterday it has never been out of my mind

'I played a very small part in the gathering together of that which was necessary to make the building I watched it grow, I watched the plans they were drawing I observed the insistent effort of Dunning and that of Kelly and their persistency as they pushed on toward this ultimate goal I saw the day the ground was broken, the first shovel full of dirt that was dug I came out here whenever I was in Washington, to take a look at what was going on Some nights I came out and sneaked into the building and was held up by the watchman, and then got the watchman to turn on the lights that there I might revel in this dream that was coming true As it went along I gloried in it and all the time there was pictured in my mind that pharmacy had grasped an opportunity, and that it was building something that was going to do in my humble opinion, more for the profession of pharmacy than has yet ever been done for it I am still of that opinion I think this building is an emblem, an emblem of Pharmacy It will be in the eyes of the public, the eyes of the people of this Great Nation and of the world This building, in my mind is like the cross to the Church, or the flag to the nations, and it is now our obligation to keep this emblem of Pharmacy unsoiled

' Just as we kept the cross from being desecrated and just as we kept the flag from being insulted, we will do that with this building and in the pride of our hearts and the love of the profession, I know that this group of men will not fail to carry on high this building the emblem of pharmacy, down on through the ages It can mean to pharmacy and it does mean to pharmacy the greatest step forward that it has every attained It means that if properly directed and properly held on high, that the public will become more and more conscious of the vital importance of pharmacy in the public health scheme Carry on we must and with this group of men here it will go down through the ages in the history of pharmacy as a wonderful accomplishment I agree with Chairman Dunning that at no time in the future will the men of pharmacy let go this opportunity, but will force it on and support it as fully as it has been supported up to this time

"I have, absolutely, an abiding confidence in that effort and if there is anything again that I can do in my humble means, please don't hesitate to call on me, because I will do it "

Chairman Dunning replied that he would remember He called on Henry D Faxon of Kansas City, who spoke in part as follows

"Every one who attended the dedication yesterday was very much impressed with the sincerity, the dignity of the speeches, of your presiding officers I never heard anything better

than the address of President Swain, my grandson said, 'I love Doctor Kelly,' he knows what he is talking about, I have heard talks of symbolism, and the thing that struck me was that you were exceedingly worldly wise in your symbolism, that you have done a thing which captures the imagination of people, that places you in a very practical sense as leaders in the pharmaceutical world

' Mrs Newcomb was kind enough this morning to take my grandson on a sight seeing trip, and she to day was telling me they passed the Institute of Pharmacy, and the kid, said There is the Institute of Pharmacy' and some lady on the front seat turned around and said, Well, think of that the nerve of those people '

Now that is what you need to place yourself in the public eye I have been a member of the ASSOCIATION for many years, I never have seen you, never have met you and I am somewhat like a man who has not been to college, who always paints too lovely a picture of the college university training I have always compared my scientific men with those that have largely asso ciated with you Unfortunately, my life has been laid strictly in the commercial field and when I received your letter Dr Dunning, I tried to think of what I might say that would be of some service to you and still not be along the regular lines of paying homage to your beautiful building You gentlemen have all faced the trite question how far persistence can go, and still live and it is an old question It seemed to me that it is fair to say that life depends on two phases one through intensity on one object and one through the aggregation of other material It seems to me that to keep from being static you must add to your activities, and there is no use of con ducting pure pharmacy if it doesn t finally lead to the goal of making a human life better

Dr Stanbury yesterday spoke about the changes in pharmacy and Mr Weicker spoke of it also To my mind, pharmacy must concern itself with distribution otherwise it will fail in serving the public, while at the present time pharmacy is represented by drug stores wherein there is conglomeration of all kinds of merchandising, still somewhere there should be a place to set off the ideals of pharmacy You gentlemen have sought perfection, that is very evident in looking at this building and in watching your dedicatory exercises There must be improvement in distribution and in all divisions if pharmacy is to continue It seems to me that if you are going to be all embracing, you must face the situation on down through to the consumer It seems to me that somewhere your plans must include the study of distributing the products which are made by the manufacturers or compounded by you, on to the ultimate consumer

' I did not hear Dr Dunning's first remarks, but I want to say, I have high regard for this organization and that anything I can do, I am willing to do I am a wholesale druggist and don't know how well the wholesaler fits into the picture I asked Dr Newcomb how many members you had among us and he gave a very limited number It occurs to me that you must get us in, that we should work in harmony with you and you with us, that there must be cooperation of the trade and the profession, and so far as mine amounts to I pledge you my efforts Thank you

Chairman Dunning thanked Mr Favon and stated that many of the ideas presented by him have been discussed and this building represents the aspiration which you have in mind in correlating the professional and scientific endeavor of all phases of pharmacy and of those who are interested in the profession and advance of pharmacy

He was very much impressed by the remarks of the grandson and not at all critical of the statement made by the lady in the bus He well understands why she would make such a remark, it is all because we have lacked nerve and here is a little demonstration If explained, the lady would be surprised if we tried to teach her what pharmacy represents to her and to the world at large Pharmacy must get rid of the inferiority complex There is no activity that is more essential to the world's welfare than our own so long as drugs are used for the treatment of ills If we stop using drugs we are of no consequence but we represent the science and knowledge of drugs I am not talking about we retailers, alone I am talking about pharmacy in general After all we are all one body whether we are in the manufacturing field wholesale field, all must have the same knowledge to deal with drugs

Chairman Dunning called on Dr Ernest L ttle who responded

He was impressed by the story that Dr Kelly told and it recalled to him a story that he heard just a few days ago about a bird which bird had developed the ability to fly backwards and even among birds that is a rather unusual procedure When being asked by one of its asso

ciates as to why it saw fit to fly in such an unusual manner it replied that it wished not only to know where it was going, but that occasionally it was interested in knowing where it had been The speaker continued

"It seems to me that we, like this very wise bird, could well spend a few minutes at this time looking backward If we do so, we shall see a number of exceedingly active, capable conscientious men concerning themselves about raising funds for a pharmaceutical headquarters building in Washington One of the most active of this group, and it would be impossible to name all of them, was Dr Dunning of Baltimore, ably assisted in the earlier years by Dr Newcomb These men worked conscientiously over a long period of time until to day we have the fruits of their labors for pharmacy and pharmacists to enjoy in all the years to come The building is indeed a work of art and is a credit to the pharmaceutical profession

"To day we meet to rejoice in its successful completion and to concern ourselves as to how it can best be used for the profession of pharmacy in the years to come We all realize, I am sure that the contribution which it is to make to the profession of pharmacy depends not so much on its beautiful exterior, as it does on the activities which are to be carried on within the building It is a satisfaction to learn that Dr Dunning and his associates do not feel that their labors are ended with the completion of the building but that they are now starting a million dollar endowment campaign for the support of this magnificient structure I am sure that sincere thanks of the pharmacists of the country go out to these men for work which they have begun and for their continued interest I have been called upon unexpectedly as a representive of the American Association of Colleges of Pharmacy to comment as to the constructive uses which could be made of this building Although I am president of that association I do not feel that I have the authority to attempt to give you the views of the Association I can assure you, however, that the pharmacy colleges of the country are anxious to make as extensive and constructive use of this building as possible and are anxious also, to cooperate with the pharmaceutical organizations in enabling it to make its maximum contribution to the profession in which we are all engaged

"I can look ahead to the not distant future when all the pharmaceutical organizations of the country will or should be housed in this building Constructive planning of a comprehensive nature would be much more possible under such conditions than it is to day It would be well if the American Association of Colleges of Pharmacy could afford to make use of a permanent secretary whose office could be in this building Probably the Association will not be able to do this at the present time or possibly for some time to come The American Association of Colleges of Pharmacy rejoices with you in this advancement for pharmacy I assure you of the continuation of the Association's interest and support We shall deem it a privilege to go along with you every possible way "

Chairman Dunning called on President C T Gilbert, of the National Association of Boards of Pharmacy He spoke in part as follows

"I am pleased that so many of the speakers have spoken their thoughts on this building, all of which I endorse, so that I won't have to repeat them, but speaking for the National Association of Boards of Pharmacy, I believe that no association in this group more fully realizes the benefits that will accrue to that Association by having its permanent office in the Institute of Pharmacy, being the association of licensing and enforcing officials, the benefit of being close at hand and in touch with the governmental affairs, having the advantage of the statistical reports that will be available in this building it will be of great value to our association

"We have gone a little further than the American Association of Colleges, and it may please you to know that the executive committee of our association has already taken steps to soon occupy that building with our main office there On Sunday evening in this hotel, the Executive Committee passed a resolution that our office would permanently so be established in this building by May 1, 1935, if possible, and not later than January 1, 1936

"I assure you, Dr Dunning, that the National Associations of Boards of Pharmacy are in full accord with everything that has been done in the erection of this building and that we are with you in spirit and also in action "

Chairman Dunning called on Dr R A Lyman, he was of the opinion that Dr Little was to speak for our Association and all he could say would repeat what he had said and this expresses the sentiment of the American Association of Colleges of Pharmacy He added

"We are very happy at the completion of the building The teachers and students in this

country had a large part in the collecting of funds and the making of the building possible It is true that in any line of work, the educational institutions are the institutions which have ideals, which should have the visions and should teach the coming pharmacists of the country what those ideals are, and do everything that we can in a teaching way to put them into effect and maintain a high standard of pharmacy

'We are very very happy, the men who are engaged in educational work, because we at last have reached a point where the colleges of pharmacy have taken their place among the academically rated institutions of the country Two or three years ago we went to a minimum course and when we did that we joined the great family of colleges

"We want to do our part, working with the other phases of American pharmacy in this national work We want to do our part in maintaining the dignity of our profession, and we are happy that we have this beautiful building representing the highest ideals of pharmacy

"I like especially the things that Mr Faxon said, and I am sure, Mr Faxon, that we educators will bear in mind the things that you have said and we will do all that we can to see that every phase of pharmacy is represented in our teaching institutions, so that the high ideals which you have in mind may be incorporated along with our scientific ideals "

Chairman Dunning introduced Secretary Ward of the American Association for Advancement of Science He said in part "I think that I may say with perfect correctness, that the American Association for the Advancement of Science represents not only the largest and the only nation-wide organization dealing with all sciences, both pure and applied, but it is also the oldest with a continuous history in this country of ours

'We celebrate this year not by any form other than that which accompanies our regular meeting, the hundredth formal meeting of the organization That does not mean quite a hundred years of history, because we frequently have met more than once in a year, and during the Civil War for example the meetings of the Society were not held That organization is sufficiently old to have seen all of the structures that in a beautiful array run along the Avenue here for a distance of nearly a half mile It still remains in three tower rooms in the old building which was erected in honor of James Smithson of England, who gave his fortune to the United States for the advancement of science without restrictions and without qualifications

"And for one, speaking really for the whole organization of 18 000 members, I have seen enough in the last three days, that I have enjoyed with you through the courtesy of your President and Secretary, I have seen enough to be proud of the fact that the AMERICAN PHARMACEUTICAL ASSOCIATION is one of the affiliated organizations connected with the American Association for the Advancement of Science The thing that impressed me most definitely was, really not the beauty of that building which you put up, nor the general dignity and impressiveness of the accommodations there for the work you represent nor yet the character of the persons who in considerable number I have had the privilege of meeting here, although all of those things made an impression on me, but the thing that impressed me as one of those who has spent forty years and a little over in teaching in the universities of our country was the thing that lay behind and underneath that building

'I wonder if you thought of the fact as you might very easily have done if you had known the history of these buildings along here that your building is unique It was not built by virtue of a grant from some foundation, which you sought and obtained as you might have done so very worthily for this purpose It was not built out of the donations of some single friend There it stands as a record of thousands of your members who pledged themselves in large and small sums for the building of a home for the profession that you represent

It has a substantial foundation in the personality of the profession and not in the beneficence of some foundation or will to do honor, and to one who has been a teacher, that is after all the most substantial foundation upon which anything can be built

'I have no doubt for a moment but that you will go ahead with the larger plans which Dr Dunning has suggested and develop them successfully Men who contribute in such sums and such numbers to the purpose of the profession with which they are connected are looking forward and will not turn back, and the American Association for the Advancement of Science wishes you that full and abundant success that your devotion merits and will secure "

Chairman Dunning thanked Dr Ward and referred to having introduced him as our

neighbor across the street He was informed that this was not the case, but he was convinced that all recognized in him a neighbor

Chairman Dunning asked F H Freericks to comment

Mr Freericks referred to the time of selection of the site when Cincinnati, the valley from which he hails took a very interesting, a very interested and a very determined position The good people of Cincinnati subscribed one hundred and fifty thousand dollars on condition that the building dedicated yesterday would be located in Cincinnati Few, if any other cities, were so determined, and expressing that thought, he knew the Chairman, and all of you would realize how deeply at least he and others felt that such a building would include wonderful possibilities for the AMERICAN PHARMACEUTICAL ASSOCIATION Mr Freericks continued 'It was my privilege and pleasure to attend my first AMERICAN PHARMACEUTICAL ASSOCIATION meeting in Baltimore in 1898, and I have missed but few of the conventions I have felt for many many years that there would be nothing so helpful to American pharmacy, nothing that would bring pharmacy better to the attention of the people generally, and to the thousands of those who have neglected being members that would justify such a building as we now have here in Washington

May I being wholly unprepared, say on this occasion, that yesterday sitting there in front of the wonder building which is a monument always will be to American Pharmacy I never listened to a more inspiring address a more appropriate address, to a more statesman like address, than the one presented by President Swain It was so fitting, it went so to the heart it was so convincing '

Referring to a friendly remark made when introduced he said

Now I see as I am sure you all see, and may I before I say that say that I have no grudge at all toward or against Dr Dunning I want to accept this opportunity to thank him in your presence for the wonderful work that he has done, for the work that he can be proud of to the end of his day as one of the outstanding things in his career, and one of the outstanding things in American pharmacy ' He continued

In endeavoring to find a thought that is practical in its application after all that is what you are seeking I believe on this occasion, something that might be helpful in the way of a suggestion or a thought thrown out, I see in the building dedicated yesterday by this ASSOCIATION, a milestone the turning of a new leaf

I see with certainty that these thousands of men in American pharmacy who have neglected the professional side of their calling will turn to it I see in it the likelihood, yes the certainty, that there will come to this ASSOCIATION the petition, such as was indicated by our President in his address last evening the petition of pharmacists that they might have the privilege of being members instead of being solicited for membership

I see in it the issuance of statements, emanating from that center of pharmaceutical activity that will bring to the attention of the people advancement in pharmacy resulting in turn to a feeling in the American public and in the mind of the American public that a man who professes to be a pharmacist, and is not a member of the AMERICAN PHARMACEUTICAL ASSOCIATION is a person of minor importance, and not of much worth in connection with his calling I visualize that this condition is going to be brought about by the wonderful building and all that it represents

Mr Chairman I want to thank you for this opportunity and privilege of having said a few words I had no reason to expect that I might be called upon, and for that reason I want to say in particular, and express how deeply I appreciate the opportunity of having had the privilege of saying a few words at this time I thank you for what you have done for American pharmacy "

The Chairman said he hoped that Mr Freericks would feel somewhat compensated for the loss that was incurred through him He also desired to bring to his attention that the pharmacists again showed their nerve *first* they put up a building here, and *second* they turned down one hundred and fifty thousand dollars He had a long list of interested pharmacists to whom he would like to extend an invitation to speak but time was limited because of other business so the number would have to be restricted He would like to hear from State chairmen

Dr R B J Stanbury said he had listened with a great deal of interest and it had certainly given him great inspiration He said a great thing had been accomplished in the building and he felt that it would be the beginning of a new era for pharmacy in this country He and his colleague Mr Jacobs, appreciate very much being present at this convention The annual convention of

the Canadian Pharmaceutical Association will be held in the city of St Johns, New Brunswick, August 6th to 9th, and he extended to this ASSOCIATION an invitation to send representatives to that meeting, and for all a very cordial invitation to be present They would be delighted to meet and greet the visitors

Secretary Jacobs, of the Retail Druggist's Association of Toronto, Canada, said he had enjoyed very thoroughly this convention, and appreciated this opportunity to say what a pleasure it had been for him to be here The convention held in Toronto a couple of years ago was a great inspiration to Canadian pharmacists and stimulated the professional side of the business considerably He wished continued success with the building project, and also all its hopes (Both Dr Stanbury and Secretary Jacobs have been members of the AMERICAN PHARMACEUTICAL ASSOCIATION for a number of years)

Chairman Dunning said he was now going to introduce a gentleman, who had been particularly active in the work that had resulted in the establishment of the American Institute of Pharmacy He had not been heard from so much during the last few years, but in the beginning of this undertaking he was most active, as many remember in developing the necessary publicity and directing the educational procedures that stimulated the interest in the project and made those who afterward supported the building minded to give up their worldly goods for a good cause He introduced Dr E L Newcomb, of the National Wholesale Druggists Association, who spoke in part as follows

I am very happy to have an opportunity to say a few words to you at this time, on the subject of the afternoon It is true that I have not spoken during the last three or four years on this project That is not because the subject had become of less interest to me but because it seemed to me that we were making very rapid progress and that the time would soon come when it would again be necessary for us to again inject into those far sighted plans of Dr Dunning, the determination to carry on Dr Dunning has outlined to you during the dedication exercises in a general way, his vision and plans for this building, for the services which it may render to American pharmacy I like Dr Little believe that it is an opportune time for us to look back before we again look ahead just for a few years, and measure our progress

This vision of a pharmacy building, of course, is something which is many years old, possibly older than I am I have been a member of the AMERICAN PHARMACEUTICAL ASSOCIATION for just about thirty years and it was one of the subjects which I heard discussed during the first years of my membership, but it was not until a few years ago down in North Carolina, up on top of Mount Mitchel that H A B Dunning unfolded his vision, and it was there over a mile above sea level, that this magnificent building was first seen and Dunning is the man that saw it at that time I did endeavor to help him and I am going to continue my endeavor to help him As we chatted over the subject up there on top of Mount Mitchel, we saw something which we tried to place before all of American Pharmacy during the succeeding years, when we were endeavoring to raise a fund of a million dollars, and I wonder to day if you have that picture, because I think it is essential in order to have that building bring the results that we have a right to expect

The results have partly been attained As we looked over the landscape from the top of Mount Mitchel we saw American pharmacy as it exists in this country Down in one of those beautiful valleys we saw the AMERICAN PHARMACEUTICAL ASSOCIATION, representing four or five thousand members from all branches of American pharmacy Down in the other direction, we saw another army of American pharmacists the N A R D , with fifteen or twenty thousand members, the retail pharmacists of this country, and in another direction we saw the National Association of Boards of Pharmacy, and in another valley the American Association of Colleges of Pharmacy and in another direction the National Wholesale Druggists' Association, and again the Federal Wholesale Druggists' Association and we looked further, and we saw another great army of pharmacists, the American Drug Manufacturers' Association and in another direction the American Pharmaceutical Manufacturers Association and again the United Medicine Manufacturers Association and in another direction the Proprietary Association

They are all great organizations rendering valuable service to their respective groups, but as we looked further, what did we see? We saw that none of these groups was accomplishing what they hoped to accomplish for their respective organizations and we asked ourselves the question as to why these accomplishments were not being secured Our analysis was that funda

mentally all of these groups were at heart dependent on the success of pharmacy, and pharmacy as a profession, and that there was need for the protection for the development, in order that American pharmacy might render its full and most valuable service to the American people, that there be some coordinating influence, some correlation between these different organizations, and that was the fundamental thought back of establishing an Institute of Pharmacy, which might represent all, and which might stand for the highest ideals of American Pharmacy

' The first step has been taken The Institute materially has been created the personnel is back of the project, and as Dr Ward said, with a backing of sixteen thousand individuals, you have a movement started You have something which hardly any other professional organization in American Pharmacy can boast of

' Now, what are we going to do with our material equipment? That is the next proposition, as I see it I did not hear what Dr Dunning said at the opening of this session We have discussed it, and I think our views coincide, and briefly, they are this

"The Institute of American Pharmacy to-day needs at least a million dollar endowment fund, possibly more, and I want to say to you that a million dollar endowment fund for the American Institute of Pharmacy is yours for the asking

"Many people say to day, 'Well, these are hard times, it is impossible to raise funds' That is not well founded Take any issue of 'Science' and look through it, and see the billions that are left and donated and contributed even during these hard times for real worth while scientific professional work I do not begrudge the medical profession a single cent that they obtain but they have obtained millions that were paid by pharmacists and the only reason why pharmacy has not secured many of the gifts to which it is rightly entitled is because we have not had more nerve It is up to the AMERICAN PHARMACEUTICAL ASSOCIATION, I believe, to take the lead and to back up the present committee or any new committee which may be created to establish an endowment of at least a million dollars, to maintain this institution in order that it may render efficient service

"Now, what are some of those services which this institution may render? In the last *Headquarters Building Bulletin* appears a review of eight pages, wherein you will find enumerated some of the services and features which an institution of this kind should and can render—not alone for the protection of American pharmacy, but for the protection of the American public, because that fundamentally is the only cause for pharmacy to exist or for this institution to be maintained As Dr Dunning said, if the people stop taking drugs and medicines, there is no reason for us to exist

Now, a word or two about the various branches of American Pharmacy, and their relation to this institution The AMERICAN PHARMACEUTICAL ASSOCIATION is fundamentally the one organization in this country with which all branches of American pharmacy may directly or in directly be affiliated It is the one association in which those who are members of manufacturing concerns, wholesale concerns, retail distributors boards of pharmacy and colleges, or other divisions may become members We have to day a great need for the AMERICAN PHARMACEUTICAL ASSOCIATION, a greater need than ever before in the history of American pharmacy Right to day over here in the Department of Commerce administrators and deputy administrators shake their heads with doubtfulness when the subject of professional pharmacy is referred to They do not fully appreciate that pharmacy is rendering a professional service, and pharmacy is a profession Please do not confuse ethics with professionalism The commercial activities of our present day pharmacists are not non-ethical, they may be perfectly ethical Many of them are commercial, and some have become so extreme that they have over shadowed our professional services and tended to mislead the American public in their appreciation of the value of the professional services which pharmacy renders

' In my judgment the American Institute of Pharmacy, with an endowment of a million dollars or more may very adequately maintain a service bureau to present to the American people truthful, up to date information on the professional aspects of pharmacy That Institute functioning as it should with research laboratories, may at frequent intervals issue reports from these research laboratories on new products which are used in medicine It may reflect honestly the views of ninety per cent or more of American pharmacy which is truly and sincerely interested in scientific professional service

When President Roosevelt said that ninety per cent of the industry of this country

wants to do the right thing, he might also have said that ninety per cent of our professional organizations are high minded and are determined that the highest ideals of the professional practice shall prevail We have in our professional practices, dentistry pharmacy and others, a minority who will be willing to lower the value of that which the majority stands for, and it is that minority in pharmacy which has tended to belittle the work of the ninety per cent, because we have not had an institution which will give to the public an understanding of the service of pharmacy

Only last week a member of the Board of Regents of one of our great states said to me that he felt it might be a mistake for his state to adopt a four year course in pharmacy, I replied I am certainly surprised to hear you speak that way You are a graduate of Harvard University, you have sent your son to Harvard, but you don't think that a pharmacist needs to have a simple undergraduate course as a requirement ' Finally he said, 'Maybe you are right '

'We are developing gradually, we are coming to a point of view which is more in line with the ideals which we hold, and unless we do aim for those ideals we are not going to make the progress that we should make

' It doesn't make any difference whether an institution is engaged in manufacturing a proprietary medicine or prescription specialty, or U S P , or N F preparation, or in wholesale activities, the welfare of that institution is determined and dependent upon the future welfare of American pharmacy, every institution that handles or manufacturers or deals in drugs or medicines in any manner, shape or form will be benefited in proportion to the success of this Institute of Pharmacy

I am of the opinion, that when this new campaign is started for an endowment, you will see a better response from wholesalers, because I believe that the last nine months have demonstrated to American pharmacy as nothing else has ever done, that we have got to stick together and unless we do support professional pharmacy as the heart of the entire drug industry, and back it up in every way, every one of our interests are jeopardized If I can render any service in raising another million dollars I will do it, and again talk to every college of pharmacy in the United States, and to every state association and local association, if necessary This project, in my judgment, is worth a lot to the wholesale druggists, to every retailer and to every other branch of American pharmacy, and we must keep it on a high plain

"I am glad that the American Institute of Pharmacy has become a reality, in this city and on this site Chicago wanted it, Cleveland and Cincinnati wanted it, but they now realize that here is the place for it I am glad the building is in Washington, that is where it should be

"It is up to every branch of American pharmacy to back it up, I hope what has been said here to day, whether you be retailer, wholesaler or manufacturer, it will cause you to leave this meeting, determined that when you are called upon to do your part you will do it

I am glad that there is a stenographer here, because the record of this meeting, and what has been said by Dr Ward should be broadcast as one of the finest pieces of publicity, throughout the entire length and breadth of this land Thank you "

Chairman Dunning said he would call on just one more gentleman, for a brief talk and for a special reason

'I came over here to Washington eleven years ago to meet the Executive Committee of the AMERICAN PHARMACEUTICAL ASSOCIATION to explain some of the remarks that I had made in a public statement in the *American Druggist* I won't go into detail in regard to it After talking an hour or more before the Executive Committee, and not making what I thought was satisfactory progress, in convincing the members of the possibility of carrying this project through I woke up and in a rather disturbed state of mind I then, again, made a few dynamic remarks which I regretted Mr Walton arose and cleared the atmosphere at that time and possibly the story might have been changed if he had not done so "

Mr Walton said the Chairman surprised him as he had no idea of being invited to speak, he did not want to take direction from the Chairman as to what he should say but would tell the story if there was no objection

"I rejoice with you, in being present at the dedication of this wonderful building It has been a matter that has deeply rooted in my heart I hoped that in a small way I might do something to bring this about

"Fortunately, I happened to be in a situation one day ten or twelve years ago, to which

Dr Dunning referred One of those situations which might well be characterized as the news papers do in pictures, 'When a Fellow Needs A Friend ' That was the occasion of the meeting of the Council in this city, after I had been elected chairman of the House of Delegates and I was invited by Chairman Beal to attend that meeting for another reason I sat through the discussion of the meeting in one of the hotels of this city, when Dr Dunning came in and made known his plans for the development of this building

' Also it was the occasion when the Council was called upon to decide whether or not they would accept that very generous offer from the American Druggists' Fire Insurance Company or whether they would have a building of their own This matter was discussed all morning I was not called upon to say a thing but the consensus of opinion seemed to be at the time of adjournment, that the question had better be put up to the ASSOCIATION for decision

'Immediately after coming to the afternoon session Dr Beal invited me to say a few words He said that I had been listening to what had been said and asked what I thought about it

' I said what was in my mind, and it was this It seems to me that the Council does not have the courage of its conviction From what I have heard this morning all of you seem to think that we ought to have our own building '

The result was that the action of the morning was rescinded, Dr Dunning with his indomitable will and energy started in to give more reasons why we should have this building of our own and as a result to day we have this beautiful building I am very glad that I have lived to see the day when it was erected "

President Swain thanked Chairman Dunning for this highly interesting and certainly a deep and stimulating program He presented to him and all others who participated in this after noon's session his very earnest and very deep and sincere appreciation

Mrs Lyman F Kebler was presented She spoke in part as follows

"This is a great privilege to speak before you Year by year day by day, we make history Some of our history is recorded and some of it is not We happen to have a book with a record of the Women's Section and a gavel of historical value I have come before you to to ask that in the interim of the meetings we may have a place in a case in the museum of the new building, to place this book of records and this gavel

'I want to express appreciation to Dr Dunning for coming before the group of women in Des Moines and giving us the opportunity of contributing collectively our money to this wonderful building We are proud of the building and are planning to carry on and hope to meet in Portland I thank you for this opportunity and assure you that with the opportunity comes responsibility and we are going to do our best to meet that responsibility Thank you '

President Swain introduced Frank L Coniglio, representing the Student Branch of the University of Florida He briefly referred to the work of the Branch and pledged its members to support the ASSOCIATION in its efforts

G G Campbell, of the Student Branch of the University of Pittsburgh reported on its work and expressed his pleasure because of the opportunity of being at this meeting

President Swain introduced E Fullerton Cook, who, he said, would discuss a forward looking constructive project
